[For studies of thermal conductivity of \bar{C} see (196) (197) (198); for studies of heat capacity of \bar{C} (39) (15) (183) as calcd. from spectroscopic data (199) (200) see indic. refs.; for studies of specific heat of \bar{C} see (21); for studies of heat of fusion and/or of transition see (39) (15) (36) (86) (157); for studies on ebullioscopic const. of \bar{C} , viz., 4.88° (201), 4.68° (202) per mole solute in 1000 g. \bar{C} , see indic. refs.; for studies on cryoscopic const. of \bar{C} , viz., 29.9° (203), 29.8° (204) per mole solute in 1000 g. \bar{C} , see indic. refs.]

[For studies of adsorption of \bar{C} on various carbons (205) (206) (207) (208) (209) (210) (211) (212) (213) at low press. (214) (215), animal charcoal (216), wood or cocoanut charcoal (217) (218) (219) (220) (221) (222) (223) (224), alumina gel (225) (226), silica gel (227) (224) (228), Fe (OH)₃ gel (229) (230), Cr (OH)₃ gel (231), TiO₂ gel (232), or mica (233) see indic. refs.]

PHYSIOLOGICAL ASPECTS OF C

 \bar{C} (as vapor) does not cause acute poisoning until exposure for 30 min. to concns. of 1000–1500 p.p.m. (234) but constant exposure to concns. above 100 p.p.m. (234) (235) or even 50 p.p.m. (236) will cause serious physiological disturbances. The least concn. of \bar{C} in air detectable by odor is 71.8 p.p.m. (237). For further studies of toxicity and industrial hygiene of \bar{C} see (238) (239) (240); for study of comparative toxicity of \bar{C} and 1,1,2-trichloroethylene (3:5170) see (241).

USES OF C

 \bar{C} is widely used as solvent, fire extinguisher, fumigant, anthelmintic, etc.; although any detailed survey of these aspects is beyond the scope of this book, a few special uses are cited. [For study of use of \bar{C} as solvent for ozonization see (24); for use in concn. of HNO₃ (242)

or AcOH (243) or in drying of higher alcs. (244) see indic. refs.; for use of molecular compound (245) of \tilde{C} with rotenone in extraction (245) and detn. (246) (247) (248) of rotenone see indic. refs.]

DETECTION OR DETERMINATION OF C

Detection of \bar{\mathbb{C}}. [For detection of $\bar{\mathbb{C}}$ in pres. of CHCl₃ (3:5050) q.v. by methods based on differences in aq. soly. (249), or on solv. power for papaverine HCl (250) or quinine sulfate (251), or on color reactions with pyrocatechol (1:1520) (252) (253), α -naphthol (1:1500) (254) cf. (255), or 2,7-dihydroxynaphthalene (255) cf. (254) (for further details on last two see at end of text of this compd. under \mathfrak{P}), see indic. refs. For review of literature of tests for $\bar{\mathbb{C}}$ see (256).]

Note that C does not (251) reduce Fehling soln. [dif. from CHCl₃ (3:5050)].

Determination of \bar{C} . Methods for the detn. of \bar{C} are based upon both physical and chemical procedures or combinations of the two.

Physical methods include those based upon adsorption of \bar{C} , e.g., on activated carbon (257) or silica gel (258); by thermal conductivity of vapor of \bar{C} (259); by measurement of vapor press. (260); or on interference refractrometry (234).

Chemical methods include those based upon decompn. of \bar{C} by combustion and/or hydrolysis followed by detn. of HCl or of chloride ion, or those based upon color reactions. [For examples of methods based upon combustion followed by detn. of HCl (261) (262) (263) (264) (265) (266) (267) (268) (279) (for combustion in H_2 see (269)); methods based upon hydrolysis with alc. alk. (270) (271) (272) or reduction with Na + ethanolamine (273) (274) followed by detn. of chloride ion; or methods based upon use of color (Fujiwara) reaction with pyridine + alkali (275) (276) (277) (278) see indic. rcfs.]

DETECTION OF OTHER COMPOUNDS IN C

[For studies on removal of CHCl₃ (3:5050) from \bar{C} by digestion with Fehling soln. at 60-70° for several hrs. (280); on detection in \bar{C} of CS₂ by addn. of MeOH (1:6120) and formn. of CS₂/MeOH azeotrope of b.p. 37.1° at 751 mm. (188) or by use of xanthate reaction (281); on removal of CS₂ from \bar{C} by use of alc. hydrazine hydrate (282) see indic. refs.; for detection in \bar{C} of carbonyl chloride see (283) (284) (285) (286) and also under phosgene (3:5000).]

PREPARATION OR FORMATION OF C

The principal methods of prepn. of \tilde{C} are those involving chlorination of CS_2 or of hydrocarbons, but many other procedures have been studied as exemplified below.

From carbon disulfide. [Prepn. of \tilde{C} from CS_2 by action of Cl_2 was first effected (287) by passage through red-hot tube; in subsequent development of this method use of various catalysts has been found to reduce the required temperature. The overall reaction is believed to occur in two stages, viz., (1) $CS_2 + 3Cl_2 \rightarrow CCl_4 + S_2Cl_2$ and (2) $CS_2 + 2S_2Cl_2 \rightarrow CCl_4 + 6S$. The resultant sulfur may be recovered and used again in prepn. of CS_2 .]

[For an extensive account of prepn. of \bar{C} prior to 1906 see monograph of Margosches (288); for longer summary as of 1938 see (289); for still later patents and articles on use of Cl₂ (290) (291) (292) (293) (294) (295) or various sulfur chlorides (296) (297) (298) (299) see indic refs.]

[For studies on use of various catalysts, e.g., Br₂ (300), I₂ (301), I₂ + Fe (302), MoCl₅ (303), SbCl₅ (304), or FeCl₃ (304), see indic. refs.; note that CS₂ reacts with SbCl₅ even without addn. of Cl₂ to give \bar{C} (305).]

[Note that in chlorination of CS₂ with restricted amts. Cl₂ various intermediate carbon chlorosulfides have been detected (306) (307).]

From methane. The formation of \bar{C} , together with CH₃Cl (3:7005), CH₂Cl₂ (3:5020), CHCl₃ (3:5050), and other products, has been very extensively studied from many viewpoints. The literature of this reaction is diffuse and interlocked with that of methane and of the various other chlorination products. For this reason and because detailed treatment of this topic is beyond the scope of this book, the following citations must be regarded only as leading references.

[The form. of \bar{C} from CH_4 by action of Cl_2 was first discovered in 1840 by Dumas (308). For examples of more recent technical papers ((309)–(317), incl.) and patents ((318)–(332), incl.) see indic. refs.]

From other hydrocarbons. [For examples of patents on prepn. of \tilde{C} from aliph. hydrocarbons higher than methane (including in some cases also their halogen derivatives) see (313) (333) (334) (335) (336) (337). — For prepn. of \tilde{C} from acetylene + Cl_2 + cat. at 100-200° (338) or with Cl_2 + eutectic of $AlCl_3/NaCl/FeCl_3$ at 175-200° (339) see indic. refs. (see also below under prepn. of \tilde{C} from tetrachloroethylene). — For prepn. of \tilde{C} from naphthalene by destructive chlorination see (340).]

From various chloro and polychloro compounds. [For technical papers on prepn. of Č from chlorinolysis of various chloro and polychloroparaffins (341) or chloropentanes (342) see indic. refs.]

[For patents on prepn. of \bar{C} from tetrachloroethylene (3:5460) with Cl_2 at 700-800° (343) or with Cl_2 over activated carbon at 600-650° (337) see indic. refs.; for study of this reaction see (344). For formn. of \bar{C} from hexachloroethane (3:4835) pyrolyzed in air at 550-600° see (342).]

[For prepn. of \bar{C} from CHCl₃ (3:5050) by chlorination with Cl₂ in sunlight (first prepn. of \bar{C}) (345) or u.v. light (346) (347) (348) (349), at 260-300° (350), or in pres. of FeCl₃ (351) or of aq. (352), or from CHCl₃ with ICl at 165° (353), or with NaOCl (reaction very slow and incomplete (354)), see indic. refs.]

[For formn. of C from CFCl₃ with AlCl₃ see (355); from CBrCl₃ with Cl₂ in dark at 100° (356) or in light (357) (358) see indic. refs.]

From miscellaneous sources. [For formn. of C from charcoal or other form of carbon + Cl₂ see patents (359) (361) and technical papers (344) (360); from trichloroacetyl chloride (3:5420) on htg. with AlCl₃ (362) or pyrolysis through glass tube at 600° (363), from trichloromethyl chloroformate (3:5515) on htg. with AlCl₃ (364), from chloral (3:5210) with Cl₂ in sunlight (365), or from acetone (1:5400) with NaOCl soln. (366) cf. (354), or from phosgene (3:5000) on htg. with cat. (344) cf. (372), see indic. refs.]

[For formn. of \bar{C} from dimethyl sulfide [Beil. I-288, I₁-(144), I₂-(276)] with Cl₂ + I₂ at 100-120° in daylight see (367) (368) (369); from trichloromethyl sulfur chloride ("perchloromethyl mercaptan") [Beil. III-135, III₁-(63), III₂-(106)] on htg. with Fe filings or ZnF₂ (370) cf. (307) (371) or with Cl₂ + I₂ in sunlight (370) see indic. refs.; from thiophosgene [Beil. III-134, III₁-(63), III₂-(105)] with Fe at 37° for many months or from "trichloromethyl dithiochloroformate" [Beil. III-215, III₂-(155)] with Fe in s.t. at 100° see (307).]

CHEMICAL BEHAVIOR OF C

Pyrolysis of Č. [C̄ on pyrolysis at 600-1500° (373) (374) cf. (344) (375) (376) gives tetrachloroethylene (3:5460) (80% yield (374)), hexachloroethane (3:4835), and other products. C̄ by action of electric arc (377) cf. (378), dark electric discharge (in H₂) (379), radium emanation (380), gives hexachloroethane (3:4835) and various other products.]

[Note also that \bar{C} in X-radiation (381) (382) or ultrasonic radiation (383) splits off some Cl₂. For action of X-radiation on mixts. of \bar{C} with aq., CHCl₃, CHI₃, lgr., or cyclohexane see (381) (384); for decompn. of \bar{C} in u.v. light below 2750 Å see (385).]

Oxidation of C. C under various oxidizing conditions yields phosgene and other products. [E.g., C with O₂ in light of 2537 Å (386) or with atomic oxygen (387) gives carbonyl chloride (3:5000); C with O₂ over white-hot Pt (375), or with air over CuCl₂ or FeCl₃ at elev. temp. (388), or C over GeO₂ (389), or C with pyrosulfuryl chloride (1 mole) + sulfuric acid monohydrate (2 moles) on warming (390) (391) (392) (393) gives phosgene (3:5000). For formn. of phosgene (3:5000) q.v. during thermal decompn. of C (as in use as fire extinguisher) see (394), also below under behavior of C with metals.] [Note that C, unlike CHCl₃ (3:5050), is not oxidized by Fehling soln.]

Reduction of C. [\bar{C} with K/Hg + aq. gives (395) methane; \bar{C} with Fe(OH)₂ + aq. alk. gives (396) CH₂Cl₂ (3:5020) + CHCl₃ (3:5050); \bar{C} with Zn + H₂SO₄ (397) (398), finely divided Fe + aq. (399) + cat. (400) (401), or on electrolytic reduction (402) gives CHCl₃ (3:5050). For behavior of \bar{C} with atomic hydrogen see (403).]

[Note that $\tilde{C} + H_2$ over pumice in hot tube gives (404) CHCl₃ (3:5050), CH₂Cl₂ (3:5020), tetrachloroethylene (3:5460) + hexachloroethane (3:4835), and at red heat (395) methane and ethylene. \tilde{C} with excess H_2 over reduced Ni at 270° gives (405) hexachloroethane (3:4835) + HCl.]

Substitution of \bar{C} . \bar{C} by reaction with F_2 , metallic fluorides, or HF, etc., each in the presence of appropriate catalysts, undergoes replacement of one or more of its chlorine atoms by fluorine and consequent formation of mixed derivatives such as CCl_3F , CCl_2F_2 ("Freon" = "Freon-12" "F-12"), $CClF_3$, etc., to whose properties as refrigerants, etc., much attention is currently being given. [Detailed analysis of the conversion of \bar{C} to these materials is far beyond the scope of this book, but for examples of leading technical papers (406) (407) (408) (409) (410) (411) and patents ((412)-(429)) see indic. refs.] (See also below under behavior of \bar{C} with inorganic salts.)

Hydrolysis of \tilde{C} . [\tilde{C} with aq. on long exposure (e.g., 7 months (430)) to sunlight gives $CO_2 + HCl$; \tilde{C} with large excess of aq. in s.t. at 250° also gives $CO_2 + HCl$, but \tilde{C} with very small proportion of aq. under same conditions gives (431) some phosgene (3:5000). At ord. temp. hydrolysis of \tilde{C} by pure aq. is scarcely perceptible, but in presence of Fe, Cu, acid, or alkali, hydrolysis is strongly accelerated especially at higher temperatures (432). \tilde{C} is hydrolyzed by aq. + reduced Fe but not by aq. NaHCO₃ (342) under reflux.]

[\bar{C} with boilg. alc. alk. is eventually completely hydrolyzed (use in detn. of \bar{C} by estimation of resultant chloride ion (see above)); however, reaction is slow and with N aq. or alc. KOH or NaOEt at 60° is very slight in 2 hrs. (433). For study of rate of hydrolysis of \bar{C} with KOH in 95% alc. (434) cf. (435), or with Ba(OH)₂ or TlOH in 50% alc. (436), see indic. refs.]

Behavior of \bar{C} with inorganic salts. [\bar{C} with AlBr₃ at room temp. for 3 days gives (358) CBrCl₃ [Beil. I-67, I₂-(31)], b.p. 104.2-104.35° at 758.5 mm. (358), but \bar{C} with AlBr₃ at 60° gives (437) cf. (438) CBr₄ [Beil. I-68, I₁-(17), I₂-(35)], m.p. 94°, b.p. 189.5° at 760 mm. with slight decompn. (439).]

[\bar{C} with AlI₃ (440), Al + I₂ in CS₂ (441), CaI₂ + 2H₂O or LiI + 1.5H₂O in evacuated s.t. at 90-92° for 5 days (50-55% yield (442)) (443), with BI₃ (444), or \bar{C} (1 mole) + C₂H₅I (4 moles) + AlCl₃ (0.1 mole) (445), or best \bar{C} (0.7 mole) with CH₃I (2.94 moles) + AlCl₃ (0.015 mole) at 40° (92% yield (446)) gives carbon tetraiodide, CI₄ [Beil. I-74, I₁-(19), I₂-(39)].]

Č with alc. AgNO₃ does not react even after several days; note that in this respect Č behaves like CH₂Cl₂ (3:5020) and CHCl₃ (3:5050) while CH₃Cl (3:7005) gives a ppt. within 3 hrs. (446).

Behavior of $\tilde{\mathbb{C}}$ with metals. $\tilde{\mathbb{C}}$ with alkali or even alkaline-earth metals undergoes explosive decompn. on htg. or even at room temp. if subjected to sufficient mechanical shock. [For studies on the explosion of $\tilde{\mathbb{C}}$ with alkali metals see (477) (448); for further studies on explosion of $\tilde{\mathbb{C}}$ with Li, Na, K, Ca, Sr, Ba, Mg, Al, and Tl, expecially with reference to sensitivity to mechanical shock, see (449). — For behavior of $\tilde{\mathbb{C}}$ with Na vapor see (450); for rate of reaction of $\tilde{\mathbb{C}}$ with Na atoms see (451); for study of $\tilde{\mathbb{C}}$ + Na/Hg as means of sepn. of isotopes of chlorine see (452) cf. (453).]

[For study of hazards of behavior of $CCl_4/CHCl_3$ mixts. with Mg (454) (455) or Al (454) see indic. refs.; note also that \bar{C} refluxed with Al powder (456) or Al/Hg (457), or \bar{C} with Al + AlCl₃ at 60-75° (458), or \bar{C} with Cu powder at 120° (458) or molecular Ag at 200° (431) gives (yields: 80% (456), 65% (457)) hexachloroethane (3:4835).]

Note that C with Mg in boilg, ether does not react, even in the presence of various catalysts (459).

[For extensive study of corrosion of metals by \tilde{C} (460) cf. (461) (462) (463) (432) see indic. refs.]

Behavior of \bar{C} with other inorganic reactants. [\bar{C} is claimed to be unaffected by conc. H_2SO_4 at 237° (464) although over H_2SO_4 on pumice at 150° \bar{C} is reported (465) to give HCl, SO_2 , $COCl_2 + CO_2$.]

[For study of photochem. reaction of \tilde{C} with H_2S giving hexachloroethane (3:4835) + S + CCl_3SH see (466); for studies on photochem. decompn. of Cl_2O in \tilde{C} see (467) (468) (469) (470) cf. (471); for behavior of \tilde{C} with Br_2O giving phosgene (3:5000) + Cl_2 + Br_2 see (472).]

[\bar{C} with NH₃ under high press. in pres. of Cu + I₂ at 140° for 17 hrs. gives (35–40% yield (473)) guanidine hydrochloride [Beil. III 82, III₁-(39), III₂-(69)]. — \bar{C} with hydrazine hydrate in stream of NH₃ refluxed for several days gives (poor yield (474)) N,N',N''-triaminoguanidine [Beil. III-122, III₁-(57), III₂-(97)], as monohydrochloride, m.p. 228° dec.]

Behavior of \bar{C} with organic reactants. With carbon monoxide. $[\bar{C}$ with CO + AlCl₃ at 200° and 250 atm. for 6 hrs. gives (37% yield (475)) trichloroacetyl chloride (3:5420).]

With hydrocarbons. [Č (excess) with octene-1 (1.8375) in pres. of small amts. (0.02 mole) of dibenzoyl peroxide (or diacetyl peroxide) adds to unsatd. linkage giving (476) 1,1,1,3-tetrachlorononane; under similar conditions C adds to one of the unsatd. linkages of diallyl (1:8045) giving 5,7,7,7-tetrachloroheptene-1 or to both giving 1,1,1,3,6,8,8,8-octachloro-octane. — For other addns of C to olefin linkages see below.]

[\bar{C} with C_6H_6 in pres. of AlCl₃ gives according to conditions triphenylchloromethane (3:3410) (477), triphenylmethane (1:7220) (478), or benzophenone (1:5150) (479). Other arom, hydrocarbons and aryl halides behave similarly but cannot be detailed here.]

With saturated halohydrocarbons. Č (0.7 mole) with MeI (2.94 moles) + AlCl₃ (0.015 mole) at 40° gives (92% yield (446)) carbon tetraiodide (see also above under behavior of Č with inorganic salts). — Č with CBr₄ in pres. of slightly moistened AlCl₃ at 170° for 7 hrs. undergoes a redistribution reaction giving (480) an equil. mixt. of CCl₄, CCl₃Br, CCl₂Br₂, CClBr₃, and CBr₄.]

With unsaturated halohydrocarbons. [C with ord. 1,2-dichloroethylene (3:5030) + AlCl₃ gives (481) (482) cf. (483) 1,1,1,2,3,3-hexachloropropane (3:6460); for reaction of this system yielding heptachloropentenes see (483).]

[\bar{C} with trichloroethylene (3:5170) + AlCl₃ at 20-30° for 48 hrs. gives (49% yield (484)) (481) (482) 1,1,1,2,3,3,3-heptachloropropane (3:6860).]

With alcohols or alcoholates. [C with MeOH over cat. at 200-350° gives (485) MeCl (3:7005); C with EtOH under similar circumstances gives EtCl (3:7015).]

[C with NaOCH₃ would be expected to yield tetramethyl orthocarbonate [Beil. III₂-(4)],

b.p. 112-113° at 724 mm. (486), $n_D^{19} = 1.3841$ (486), but this reaction is unreported, the expected prod. having been made only by other methods. — \bar{C} with NaOC₂H₅ would be expected to yield tetraethyl orthocarbonate [Beil. III-5, III₁-(4), III₂-(5)], b.p. 157-158° (487), 59.6-60° at 14 mm. (486), $D_4^{18.5} = 0.9197$ (488), $n^{18.5} = 1.39354$ (488), but this reaction is unreported cf. (505); however, the prod. has been prepd. from CBr₄ with NaOEt in dry ether in s.t. at 170° (487), from "thiocarbonyl tetrachloride," CSCl₄ cf. (489) refluxed in dry ether with NaOEt, and in other ways]

With mercaptans or mercaptides. [\bar{C} with NaSCH₃ might be expected to give tetramethyl tetrathioorthocarbonate, C(SCH₃)₄, but this appears to be unreported; \bar{C} with NaSCH₃ has been found (492) to react differently giving trimethyl trithioorthoformate [Beil. II₁-(39)], m.p. 16° (493), b.p. 220° dec. (493), 103–104° at 12 mm. (492), 96° at 9 mm. (493), $n_D^{15} = 1.5696$ (492), and dimethyl disulfide, b.p. 39–41° at 18 mm. (492). — \bar{C} with NaSC₂H₅ is claimed (491) to give the expected homologous tetracthyl tetrathioorthocarbonate C(SC₂H₅)₄, but this material was not well characterized, and \bar{C} with NaSC₂H₅ has subsequently (492) been found to give triethyl trithioorthoformate [Beil. II-95, II₁-(39)], b.p. 235° dec. (493), 174° at 760 mm. (494), $D_D^{20} = 1.053$ (495), $n_D^{15} = 1.5410$ (492). — For behavior of \bar{C} with salts of n-propyl, n-butyl, and ter-butyl mercaptans see (492).]

With phenols or phenolates. [\bar{C} with phenol (1:1420) in pres. of $ZnCl_2 + ZnO$ at 120° gives (496) diphenyl carbonate (1:2335), various dihydroxybenzophenones, and other products; for analogous study of \bar{C} with o-cresol (1:1400) see (497).

[C with K phenolate at 170° gives mainly (498) aurin (pararosolic acid) (4',4''-dihydroxy-fuchsone) [Beil. VIII-361, VIII₁-(671)]; for analogous behavior of C with K o-cresolate and K m-cresolate see (498).]

With diacyl peroxides. [C refluxed with di-n-butyryl peroxide for 17 hrs. gives (499) n-propyl chloride (3:7040) + hexachloroethane (3:4835) + ethyl n-butyrate (1:3127); C refluxed similarly with di-n-isobutyryl peroxide gives (499) isopropyl chloride (3:7025) + hexachloroethane (3:4835) + ethyl isobutyrate (1:3095).]

[$\bar{\mathbf{C}}$ with di- α -naphthyl peroxide under reflux gives (500) CO₂, α -chloronaphthalene (3:6878), α -naphthoic acid (1:0785), and other products; $\bar{\mathbf{C}}$ with di- β -naphthyl peroxide under reflux gives (500) CO₂, β -chloronaphthalene (3:1285), β -naphthoic acid (1:0800), and other products.]

[Č with dibenzoyl peroxide under reflux gives (501) (502) (503) 4-(trichloromethyl)-benzoic acid, hexachloroethane (3:4835), phosgene (3:5000), chlorobenzene (3:7903), and other products; for study of kinetics of reaction see (504).]

With salts of enolic esters. [\bar{C} with diethyl sodio-malonate (505) (507) or with diethyl disodio-malonate (506) (507) (508) (509) gives the Na enolate of tetraethyl α,γ -dicarboxy-glutaconate, (C₂H₅OOC)₂C=CH—CH(COOC₂H₅)₂ [Beil. II-876, II₁-(336), II₂-(710)], b.p. 208-210° at 23 mm. (510), 200-204° at 18 mm. (510); note that this product is also obtd. from CHCl₃ (3:5050) with diethyl sodio-malonate (505) (511) (512) (513) (514) (515) (516) (517).]

[C with 4 moles of Na enolate of ethyl cyanoacetate in alc. at 100° gives (505) cf. (508) the sodium enolate of diethyl α , γ -dicyanoglutaconate, C_2H_5OOC —C(CN)—CH—CH- $(CN)COOC_2H_5$ [Beil. II-878, II₂-(712)], also obtd. from $CHCl_3$ (3:5050) with the Na enolate of ethyl cyanoacetate (518) (519) (520).]

With amines. The behavior of \bar{C} with amines has been little studied. [For studies on the behavior of \bar{C} with aniline (521) and also with other aromatic amines in pres. of Cu powder (522) or I₂ (523) see indic. refs.]

Color reaction with α-naphthol/cyclohexanol. C
 (1 drop) with 2 ml. of a 2% soln. of α-naphthol (1:1500) in cyclohexanol (1:6415) + 1 pellet of solid NaOH, boiled

- 25 seconds and cooled, gives (254) blue color; one portion of this blue solution underlaid with equal volume 85% $\rm H_2SO_4$, stood 1 min. and shaken, remains blue; a second portion of the alkaline blue soln. acidified with equal vol. AcOH (1:1010), stood 1 min. and shaken, becomes red. [Note that the alkaline boilg. also gives a blue color with $\rm CH_2Cl_2$ (3:5020) and with CHCl₃ (3:5050), while other chlorinated solvents (254) give yellow-brown, gray, or brown; in the $\rm H_2SO_4$ acidification $\rm CH_2Cl_2$ (3:5020) gives greenish blue, while both CHCl₃ (3:5050) and $\rm \bar C$ give intense blue; in the AcOH acidification $\rm CH_2Cl_2$ (3:5020) gives yellow while CHCl₃ (3:5050) gives an orange-yellow color.]
- ② Color test with 2,7-dihydroxynaphthalene/cyclohexanol. C

 ☐ (1 drop) with 2 ml. pure cyclohexanol (1:6415) + 1 pellet NaOH + a few mgms. 2,7-dihydroxynaphthalene htd. at 197° (b.p. of ethylene glycol) for 45 seconds, decanted from undissolved NaOH, cooled, and shaken with 2 ml. AcOH + 4 ml. 96% EtOH, gives a pale yellow-brown color (255). [Note that under these conditions CH₂Cl₂ (3:5020) gives a steel-blue color while CHCl₃ (3:5050) gives a deep red color.]
- ② Color test with cyclopentanol. C (1 drop) in 1 ml. cyclopentanol (1:6412) + 1 pellet NaOH boiled 25 seconds, then shaken vigorously for 35 seconds, and treated with 4 ml. 96% EtOH and shaken, gives an intense brown color (255). [Note that, after addition of alc., CH₂Cl₂ (3:5020) gives a more intense red or becomes reddish brown while CHCl₃ (3:5050) gives only a pale citron-yellow. By comparing with authentic known samples, this test is claimed (255) to be able to detect as little as 5% C in CHCl₃.]

[See also the higher-boilg. stereoisomer (3:5150).]

3:5110 1,2-DICHLOROPROPENE-1

[For prepn. of C from 1,2,2-trichloropropane (3:5475) with MeOH/NaOMe or EtOH NaOEt at ord. temp. (55-58% yield (1)), or with alc. KOH (2) or with aq. on htg. in s.t. (3), see indic. refs.]

 \tilde{C} with abs. MeOH (1:6120) forms a const.-boilg. mixt., b.p. 56.5-56.8° at 760 mm., $n_D^{25} = 1.4030$, contg. 75 wt. % \tilde{C} (1).

 \tilde{C} with Cl₂ at 0° in strong light adds 1 mole halogen giving (1) 1,1,2,2-tetrachloropropane (3:5825).

Č with Br₂ at 0° slowly adds 1 mole halogen giving (1) (3) 1,2-dibromo-1,2-dichloro-propane, b.p. 190° (3).

 $\ddot{\mathbf{C}}$ with O_3 in CCl₄ at -15° followed by aq. gives (1) acetic acid (1:1010) and formic acid (1:1005).

Colorless oil insol. in aq.

[For prepn. of \bar{C} from 1,1,1-trichloropropanol-2 (3:0846) with Zn dust + AcOH see (6) (5); from corresp. acetate with Zn dust + alc. see (8); from butylchloral $(\alpha,\alpha,\beta$ -trichloro-n-butyraldehyde) (3:5910) (1) (2) (9) or its alcoholate (10) with KOH see indic. refs.; from Ag 2,2,3-trichlorobutyrate on boilg. with aq. (3) or Na 2,2,3-trichlorobutyrate on distn. (4) see (3) (4); for prepn. from 1,1,2-trichloropropane (3:5630) + aq. or alc. alk. or aq. Ca(OH)₂ see (11) (14).]

 $\ddot{\mathbf{C}}$ on oxidn. with $K_2Cr_2O_7 + H_2SO_4$ gives (7) AcOH (1:1010).

 $\ddot{\mathbf{C}}$ adds $\mathbf{Br_2}$ very easily giving (9) 1,1-dichloro-1,2-dibromopropane [Beil. I-111], b.p. 188° (9). — $\ddot{\mathbf{C}}$ with $\mathbf{Cl_2}$ at 0-30° yields (12) 1,1,1,2-tetrachloropropane (3:5270), b.p. 153°.

 \tilde{C} with HCl + AlCl₃ at 5-10° yields (13) (14) 1,1,1-trichloropropane (ethylchloroform) (3:5270), b.p. 106-107°.

Note 1. For b.p. of Č at press. 660-860 mm. (25), 400-1080 mm. (2), see indic. refs.; Č has b.p. 84.9-85.5° at 777 mm. (53).

Note 2. For vap. press. of \bar{C} over range -30 to 100° (1), or $0-30^{\circ}$ (8), or $0-25^{\circ}$ (55) see indic. refs.; for relation between vap. press. and temp. see (56) (25).

Note 3. For values of n^{18} at 14 different wave lengths see (57).

Care must be taken to avoid confusion of $\bar{\mathbf{C}}$ with either cis (3:5042) or trans (3:5028) 1,2-dichloroethylene.

MISCELLANEOUS PHYSICAL PROPERTIES

Various solubility relations. \bar{C} is almost insol. aq., but easily volatile with steam (see under azeotropes); soly. of \bar{C} in 100 g. aq. at 0° is 0.873 g. (58), 0.922 g. (8); at 10° = 0.885 g. (8); at 15° = 0.872 g. (59); at 20° = 0.869 g. (8), 0.849 g. (58); at 25° = 0.865 g. (15); at 30° = 0.90 g. (59), 0.894 g. (8); at 35° = 0.895 g. (58); at 56° = 1.030 g. (58). — [For influence of added salts in diminishing soly. of \bar{C} in aq. see (16). — Note that \bar{C} with aquander press. forms a solid hydrate which can be maintained up to +18° under 100 atm. but which at ord. press. decomposes below 0° (60). — For soly. of aq. in \bar{C} at 0°, 25°, and 30° (as detd. by Karl Fischer reagt.) see (61).]

[For soly. in \tilde{C} of NH₃ at 20° and 1 atm. (62), of H₂S at 20° and 1 atm. (62), of HCl at various temps. and press. (62) (63), of ethylene at 0-40° (4), or of chlorine at -9° to +40° (4) see indic. refs.]

[For soly. in \bar{C} of I_2 over range 11-25° (and comparison with other chlorinated solvents) see (64).]

[For study of industrial recovery of \bar{C} by countercurrent absorption in kerosene see (65).] Adsorption of \bar{C} by solids. [For studies on adsorption of \bar{C} by activated carbon (66) (67) (68) (69) (70), by silica gel (67), or by alumina gel (71) see indic. refs. — For patent on sepn. of \bar{C} from other solvents by adsorption on carbon see (72).]

Other properties. [For study of thermal conductivity of \bar{C} see (73); for study of diffusion of vapors of \bar{C} through films of various cellulose esters see (74).]

Binary systems contg. C. (See also azeotropes (below).)

 \bar{C} with hydrocarbons — \bar{C} + n-heptane (1:8575): use in testing of distg. columns (detn. of number of theoret. plates) see (75). — \bar{C} + cyclohexane (1:8405): for values of D_0^{20} and n_D^{20} (49), for use in detn. of number of theoret. plates in distg. columns (75), or for sepn. of \bar{C} from system by forming azeotrope of cyclohexane with McOH (76), see indic. refs. (see also below under azeotropes).

 \ddot{C} + benzene (1:7400): note that because of the proximity of the b.p.'s of the components, because of the importance of both as industrial solvents, and because they are not readily separable by chemical means (such as H_2SO_4 , etc.) a great deal of study has been given to the system from various viewpoints.

For f.p./compn. data on system $\ddot{\mathbf{C}}$ + $\mathbf{C}_6\mathbf{H}_6$, eutectic, f.p. -54.2° , contg. about 67 mole % $\ddot{\mathbf{C}}$ see (24) cf. (77); for D_{20}^{20} (78) (79), n_D^{20} (78) (79) (49), or n_D^{25} (80) (89) cf. (81) see indic. refs. — For use of this system as test liq. for studying efficiency of distn. columns see (81) (78) (79) (82); for study of distn. of the system see (78) (79) (81) (82) (83) (84) (85); for use in detn. number of theoret. plates see (75) (78); for data on vap. press. of system, vapor liq. compn., etc., see (86) (87) (88) (80) (49) (89) (90).

 \bar{C} + toluene (1:7405): for n_D^{25} for system see (91) (92); for vapor-liq. equil. data and study of distn. of system see (83) (91) (92) (93).

 \bar{C} with other cpds. of Order I. \bar{C} + acetic acid (1:1010): for values of D and n for the system see (94); for vapor-liq. equil. see (95); see also under uses of \bar{C} (below). — \bar{C} + phenol (1:1420): for vap. press. of system see (96). — \bar{C} + acetime (1:5400): for D and n_D^{2D} see (49) (94), for vapor-liquid equil. see (49). — \bar{C} + diethyl ether (1:6110): for f.p./compn. data and diag. see (24); for D_0^t over range 0-40° see (97). — \bar{C} + ethylene axide (1:6105): for soly. and vap. press. (98) and vapor-liq. equil. (106) see indic. refs.

 \bar{C} with cpds. of Order III. $\bar{C}+CHCl_3$ (3:5050): for b.p./compn. diag. see (99). — $\bar{C}+CCl_4$ (3:5100): for D_{20}^{20} (100) and vapor-liq. compn. data and diagrams (100) (99) (88) (see also below under azeotropes).

 $\ddot{C}+1,1$ -dichloroethane (3:5035): for b.p. at 760 mm., D_4^{20} , and vapor-liq. equil. data see (101). $-\ddot{C}+1,1,2$ -trichloroethane (3:5330): for f.p./compn. data, eutectic f.p. -79°

(102), and for D and vapor-liq. equil. (4) see indic. refs. $-\bar{C}+1,1,2,2$ -tetrachloroethane (acetylene tetrachloride) (3:5750): this system forms a 1:1 cpd., m.p. abt. -31.3° (102); for f.p./compn. data and diagrams see (102); for $n_{\rm H\alpha}^{25}$ /compn. and $n_{\rm H\alpha}^{t}$ for range $t=14-27^{\circ}$ see (30). $-\bar{C}+p$ entachloroethane (3:5880): for f.p./compn. data, eutectic, f.p. -62°, see (102).

 \bar{C} + cis-dichloroethylene (3:5042): for f.p./compn. data see (103). — \bar{C} + trans-dichloro-

ethylene (3:5028): for f.p./compn. data see (103).

 $\bar{C}+1,2,4,5$ -tetrachlorobenzene (3:4115): for f.p./compn. data see (35). — $\bar{C}+carbonyl$ chloride (phosgene) (3:5000): for soly. relations at 20°, 0°, and -15° (104) and b.p., vaporliq. equil. (105) see indic. refs. — $\bar{C}+2$ -chloroethanol-1 (ethylene chlorohydrin) (3:5552): for D and liq.-vapor equil. data and diag. see (106).

 \bar{C} with miscellaneous cpds. of orders other than I or III. \bar{C} + ethylene dibromide: for f.p./compn. data (the two form solid solns.) see (103) (102) cf. (107); for D_{25}^{25} and n_{D}^{25} for system see (48) cf. (108). $-\bar{C}+1,1,2,2$ -tetrabromoethane (sym.-acetylene tetrabromide): for f.p./compn. data see (102). $-\bar{C}+c$ carbon disulfide: for f.p./compn. data and diag. see (28). $-\bar{C}+s$ succino(di)nitrile: for f.p./compn. data, eutectic at -48° , see (102), cf. (109).

Azeotropes (const.-boilg. mixts.) contg. \bar{C} . \bar{C} with aq. forms a heterogeneous const.-boilg. mixt., b.p. 72°, contg. 80.5 wt. % \bar{C} (110).

Azeotropes with hydrocarbons. \bar{C} with cyclohexane (1:8405) forms a const.-boilg. mixt., b.p. 74.4° at 760 mm., $n_0^{20} = 1.42879$, contg. 45.5 wt. % \bar{C} (49).

Azeotropes with other chlorohydrocarbons. \bar{C} with CCl_4 (3:5100) forms a const.-boilg. mixt., b.p. 75.6° at 760 mm. (7), 75.3° at 760 mm. (100), contg. 21 wt. % (7) or 30 mole % (100) \bar{C} . $-\bar{C}$ with trichloroethylene (3:5170) forms a const.-boilg. mixt., b.p. 82.9° at 760 mm., contg. 82 wt. % \bar{C} (7).

Azeotropes with alcohols. \bar{C} with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 60.95° at 760 mm., contg. 68 wt. % \bar{C} (111). $-\bar{C}$ with EtOH (1:6130) forms a const.-boil. mixt., b.p. 70.5° at 760 mm., contg. 63 wt. % \bar{C} (111). $-\bar{C}$ with n-propyl alc. (1:6150) forms a const.-boilg. mixt., b.p. 80.65° at 760 mm., contg. abt. 81 wt. % \bar{C} (111). $-\bar{C}$ with isopropyl alc. (1:6135) forms a const.-boilg. mixt., b.p. 74.7° at 760 mm., contg. 56.5 wt. % \bar{C} (111). $-\bar{C}$ with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 83.45° at 760 mm., contg. 93.5 wt. % \bar{C} (112). $-\bar{C}$ with ter-amyl alc. (1:6160) forms a const.-boilg. mixt., b.p. 83° at 760 mm., contg. 94 wt. % \bar{C} (113).

Azeotropes with acids. \bar{C} with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 77.4° at 760 mm., contg. 86 wt. % \bar{C} (114). [Note that no data on any azeotrope of \bar{C} with AcOH can be found; however, for use of \bar{C} in dehydration or concn. of AcOH see below under uses of \bar{C} .]

USES OF C

Because of its valuable solvent props. and high volatility \tilde{C} is widely used in a great many different connections, some of which involve its mixture with one or more other organic compounds. — Although no review of its uses could hope to be complete, the following examples are intended to be helpful in suggesting typical cases.

[For general reviews which include uses see (115) (34) (116); for an important annotated and indexed bibliography contg. 469 titles see (117).]

References on the use of \tilde{C} (or of its mixts, with CCl₄) as a furnigant for grain or as an insecticide or fungicide are beyond the scope of this work; however, a few citations on some aspects of this use are given as lead articles.—[E.g., for general articles on this aspect see (118) (119) (120) (121) (122); for study of combustibility of \tilde{C}/CCl_4 mixts, used

for fumigation (123), for study of extinction of flames from \ddot{C} with CO₂ (124), for effect of \ddot{C}/CCl_4 on metals during its use for fumigation (125).]

[For use of \bar{C} in concn. (dehydration) of AcOH see (126) (127) (128) (129) (130); for similar use with propionic acid, butyric acid, and valeric acid see (131), for use in dehydration of EtOH see (132).]

[For use of system \bar{C} (40%) + CCl₄ (3:5100) (60%) as dry cleaner's solvent (133) and removal of scavenged impurities with carbon (134) see indic. refs.; for use of system \bar{C} (75%) + trichloroethylene (3:5170) (25%) as dry cleaner and metal degreesing solvent see (135) (136) (137).]

[For use of \tilde{C} in extraction of oils (138) (139) (140) (141) (142) (143), in purifn. of vitamincontg. oils (144), in extractn. of soybean oil (incl. n_D^{25} for system) (47), in wool degreasing (145) (146) see indic. refs.]

[For use of C in lacquer and varnish industry see (147) (148) (149).]

[For study of \bar{C} as solvent for cellulose acetates see (150) (151), for use of \bar{C} + EtOH as solv. for cellulose acetate see (152); for use of \bar{C} in sepn. of simple from mixed cellulose esters see (153); for use of a mixt. of \bar{C} (90–40%) + an alc. (10–60%) (154) or a mixt. of \bar{C} (40–50%) + an alkyl acetate (60–50%) (155) as solv. for cellulose ethers see indic. refs.]

[For use of \tilde{C} in dewaxing of mineral oil (156) (157), as solvent for rubber (158), for removal of caffeine from coffee (159), as component of refrigerant liq. (160), in purifn. of triphenyl phosphate (161), in dentrifices (162), in hair-wash (163) see indic. refs.]

[For use of C in sepn. of olefins and diolefins from alkanes see (164).]

[For patents on sepn. of mixts. of $\bar{C}+1,2$ -dichloropropane (3:5200) + n-butyl alc. (1:6180) (165), or of $\bar{C}+aq$. sol. alcs. and /or ketones (166), see indic. refs.]

 \bar{C} also serves as a raw material for the comml. manufacture of other prods.; this topic cannot be fully explored here, but attention is called to two important examples. — For use of \bar{C} as starting point for the prepn. of elastothiomers (167) such as "Thiokol A" (168) (169) (170) (from \bar{C} + alkali polysulfide) or elastoplastics (167) of the polyarylethylene type such as AXF (171) (172) (from \bar{C} + aromatic hydrocarbons + AlCl₃) see indic. refs. (and also below under chem. behavior of \bar{C}). — For use of \bar{C} as starting point for prepn. of ethylene glycol (1:6465) by hydrolysis, ethylenediamine by ammonation, or vinyl chloride by dehydrohalogenation see below under chem. behavior of \bar{C} .

TOXICITY AND PHYSIOLOGICAL ACTION OF C

Full treatment of this topic is beyond the scope of this work; however, for lead references on toxicity of \bar{C} see (390) (391) + (173)-(180) incl. (references earlier than 1934 will be found in the cited articles).

[For study of \bar{C} as anthelmintic see (181) (182); for antiseptic and disinfectant actn. see (183) (184); for actn. of \bar{C} on yeast see (185).]

DETERMINATION OF C

Some methods for detn. of \bar{C} involve conversion of all of its halogen to chloride ion and subsequent volumetric or gravimetric detn. of the latter: e.g., for methods based on initial pyrolytic decompn. see (186), for methods involving initial combustion of \bar{C} with MnO₂ at 300° (187), with air (188), in a modified sulfur lamp (189), or (for high conens.) by an explosion pipet method (190) see indic. refs. — For methods based on conversion of halogen to chloride ion by reactn. with Na + ethanolamine in dioxane (191) (192) (latter discussed application to mixts. of \bar{C} with CCl₄ (3:5100) and with tetrachloroethylene (3:5460)), or with alc. NaOEt (193) (194) (195) (note that this method gives CH₂=CHCl + NaCl), see indic. refs.

Note that oxidn. of \bar{C} with CrO_3/H_2SO_4 in pres. of Hg yields CO_2 quantitatively (196) (dif. from many polychloro cpds.). — Note also that \bar{C} does *not* respond to the R + H "Tri-Per Analyzer" (a recording ultra-violet photometer) (197).

For detn. of C in organs and tissues see (198).

PREPARATION OF C

The most-studied method for prepn. and manufacture of \bar{C} is that from ethylene by addn. of chlorine; this method is also of historical interest as leading to the discovery of \bar{C} in 1795 (199) and its initial designation as "oil of the four Dutch chemists." — Various other modes of forms, of \bar{C} have since been discovered and will be indicated below.

Preparation from ethylene. By use of chlorine. Ethylene with chlorine under certain conditions adds chlorine quant. yielding only \bar{C} ; under other conditions, however, the system gives 1,1,2-trichloroethane (3:5330) + HCl. — In the absence of catalysts, the substitution reactn. is avoided by use of very low temperatures; in the presence of catalysts addition (rather than substitution) is facilitated even at the higher temperatures (e.g., 120°) resulting from heat of reactn.

For general articles discussing the various factors involved see (200) (201) (53) (202) (203) (204) (205) (69); for articles discussing the reaction from the viewpoint of utilization of the ethylene of industrial gases see (206)–(214) incl.; for patents on prepn. of \bar{C} from ethylene + Cl_2 see (215)–(236) incl. [For prepn. of "heavy" \bar{C} contg. one C^{13} atom see below under miscell. prepns.]

By use of HOCl ($Cl_2 + H_2O$, etc.). Although ethylene with HOCl solns, gives mainly ethylene chlorohydrin (3:5552) nevertheless some \bar{C} is formed; for studies of this reactn. see (237) (238) (239) (240) (241).

By other miscellaneous reagts. [For formn. of \tilde{C} (together with other prods.) from ethylene with Cl_2 in AcOH or Ac₂O soln. (242), with HCl + air over pumice contg. CuCl₂ at 300° (243), with aq. ICl (244), with NCl₃ in CCl₄ soln. at 20-25° for 7 days (245), with nitryl chloride (ClNO₂) (246), with SbCl₅ or CuCl₂ (247), or with N-chlorourea (253) see indic. refs.]

Formation of \tilde{C} from ethane or acetylene. [For formn. of \tilde{C} from ethane with NOCl at 300° (248) or with $Cl_2 + O_2 + cat.$ at 300-650° (249) see indic. refs.; for formn. of \tilde{C} (together with other prods.) from acetylene with HCl gas in pres. of NO₂ (250), or with Cl_2 in pres. of $CCl_4 + AlCl_3/NaCl/FeCl_3$ at 175-250° (251) cf. (252), see indic. refs.]

Formation of C from miscellaneous sources and by various methods. [For formn. of C (together with other prods.) from methyl chloride (3:7005) in dark elec. discharge (254); from ethyl chloride (3:7015) with Cl₂ in light (255), with NCl₃ (256), or with SbCl₅ in s.t. at 100° (257); from 1,2-dibromoethane (ethylene dibromide) (1 mole) with SbCl₅ (2 moles) (note that use of only 1 mole SbCl₅ yields ethylene chlorobromide) (258); from 1-chloro-2-iodoethane (ethylene chloro-iodide) with finely divided Ag at 160° (259) see indic. refs.]

[For formn. of \tilde{C} (together with other prods.) from ethylene glycol (1:6465) with excess fumg. HCl in s.t. at 100° (260), with PCl₃ + ZnCl₂ (57% yield (261)), with PCl₅ (262), or PCl₅ + ZnCl₂ (37% yield (261)), with SOCl₂ + pyridine (62% yield (261)) see indic. refs.; from ethylene oxide (1:6105) with S₂Cl₂ (263); from 1,4-dioxane (1:6400) with Zn + acid chlorides (264); from 2-chloroethanol-1 (ethylene chlorohydrin) (3:5552) by disproportionation in s.t. at 184° for 10 hrs. (265) or during reactn. with HBr (266); from bis-(β -chloroethyl) sulfate with Cl₂ (267); from bis-(β -chloroethyl) sulfate with conc. aq. HCl (268) or with alk. chloride + dil. HCl (269) see indic. refs.]

[For form. of C (together with other prods.) from diazomethane with ZnCl₂ in ether (270), from ethylenediamine with NOCl in xylene (271), see indic. refs.]

[For prepn. of "heavy" \bar{C} contg. 1 C^{13} atom (from NaC¹³N via CH₃C¹³N, CH₃.C¹³-H₂NH₂, CH₃.C¹³H₂N(CH₃)₃OH, CH₂=C¹³H₂) and its reactn. with Cl₂ see (272).]

CHEMICAL BEHAVIOR OF C

Pyrolysis of C. C on suitable htg. especially in pres. of dehydrohalogenating cat. loses 1 mole HCl yielding vinyl chloride (3:7010) [e.g., C over activated carbon at 230-250° (273), or with aq. vapor over cat. at 800-1000° (274), or over pumice at 600° (275) cf. (276) (277), or over alumina at low red heat (278) yields vinyl chloride (3:7010)].

BEHAVIOR OF C WITH INORGANIC REACTANTS

Reaction of C with Cl₂. C with Cl₂ gives according to the conditions chlorinated derivatives either of the ethylene or ethane series.

[E.g., \bar{C} with Cl₂ in pres. of AlCl₃/NaCl/FeCl₃ at 400–480° gives (279) a mixt. contg. 20% 1,1-dichloroethylene (3:5005) + 22% 1,2-dichloroethylene (3:5030) + 29% trichloroethylene (3:5170) + 29% higher chlorination prods.; \bar{C} with Cl₂ over suitable cat. at 300–500° gives (280) tetrachloroethylene (3:5460).]

[On the other hand, \tilde{C} with Cl_2 in ultra-violet light at 50° (281) (282), or 25° (283), or \tilde{C} with Cl_2 + suitable cat. at not above 60° (284), or \tilde{C} (as liquid) with Cl_2 (285), or \tilde{C} with Cl_2 in pres. of $AlCl_3/NaCl/FeCl_3$ at 300–425° as directed (279), or \tilde{C} with SO_2Cl_2 + trace of dibenzoyl peroxide refluxed 2 hrs. in dark (286) gives (yields: 80% (284), 70% (283) (286), 50% (279)) 1,1,2-trichloroethane (3:5330). — Furthermore, \tilde{C} with Cl_2 as directed (287) (288) or Cl_2 + $AlCl_3$ at 70–80° (289) (327) gives 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). — Finally \tilde{C} (in vapor phase) with Cl_2 + cat. (290) cf. (285) or \tilde{C} with Cl_2 at elev. temp. and press. (291) yields hexachloroethane (3:4835).]

Reaction of \bar{C} with alkalies. \bar{C} with alkalies or substances behaving as such may according to circumstances undergo either (or both) of two reactions: on the one hand \bar{C} may lose HCl (1 mole) (dehydrohalogenation) yielding vinyl chloride (3:7010); on the other \bar{C} may be hydrolyzed to ethylene glycol (1:6465).

Dehydrohalogenation. C with aq. alk. at elev. temp. and press. (292) especially in press of tetramethylene glycol, etc. (293), or C with MeOH/alk. (294), or EtOH/alk. (53) (295), loses HCl giving (91-93% yield (53)) vinyl chloride (3·7010). — [For study of rate of reactn. of C with KOH in 95% EtOH at 90° and 100° (296) (297), with NaOEt or KOEt in 95% EtOH or 48% EtOH at 90° (296) (297), or with MeOH/NaOMe at 17-19° (298) see indic. refs. — Note that C with alc. NaOEt at 100° under press. gives 90% yield (299) ethyl vinyl ether (1:7810).]

Hydrolysis. C under appropriate conditions hydrolyses to ethylene glycol (1:6465); for general articles from this viewpoint see (110) (214) (314).

[For hydrolysis of \bar{C} to ethylene glycol with aq. vapor over cat. at 550-850° (300), with aq. at 200° under press. in absence of any acid acceptor (301), or with aq. at 120° under press. (302) see indic. refs. cf. (110).]

[For hydrolysis of \bar{C} to ethylene glycol with aq. KOH at elevated temp. and press. see (110). — For study of use of Na₂CO₃ and/or NaHCO₃ in aq. (214) (303) (304) (305) (306) or in 85% EtOH (307) cf. (214) see indic. refs. — For use of aq. CaCO₃ in pres. of NH₄ salts (308) (309), or aq. BaCO₃ (310) at elev. temp. and press., see indic. refs. — For use of sodium formate in MeOH at 165° under press. (311) cf. (214), aq. + PbO in s.t. at 170° (312), or Fe₂O₃ (?) (313) see indic. refs.]

For use of hydrolysis with alk. followed by KMnO₄ oxidn. of resultant ethylene glycol to oxalic acid as means of distinction between \bar{C} and the isomeric 1,1-dichloroethane (3:5035) see (256).

Reaction of \tilde{C} with alk. sulfides or polysulfides, etc. [\tilde{C} with aq. NaSH at 100° under press. gives (65% yield (315)) 1,2-dimercaptoethane ("ethylene dimercaptan") [Beil. I-471, I_1 -(244), I_2 -(529)].]

C with aq. (316) or boilg. alc. (317) Na₂S yields 1,4-dithiane [Beil. XIX-3, XIX₁-(609)],

cryst. from hot alc., m.p. 110-111° (318).

[C with alk. or alk.-earth tetrasulfides yields elastothiomers (167) such as "Thiokol A" (168) (169) (170); for very important compact survey of this reactn. and field see (319); for lecture experiment illustrating prepn. of "Thiokol A" see (320).]

Reaction of \bar{C} with metals. [For studies of \bar{C} from viewpoint of corrosion of metals see (321) (322) (323). — \bar{C} on warming with K loses HCl yielding (295) vinyl chloride (3:7010) and H_2 ; note, however, that \bar{C} with Na or K or their alloys, or even with alkaline-earth metals, may (like many other polychloro cpds.) explode under certain conditions; for extensive studies of this behavior including sensitivity to mechanical shock see (324).]

[C with Na in liq. NH₃ loses both atoms of chlorine yielding (325) (326) ethylene +

NaCl; note that little, if any, (325) ethylenediamine is formed.]

Reaction of Č with various metal salts (of inorganic acids). [Č with anhydrous AlCl₃ at 45-55° loses 1 HCl yielding (53) polymerization prods. of vinyl chloride; at 80-85° the reactn. involves loss of 2 HCl yielding (327) some acetylene.]

[$\bar{\mathbf{C}}$ with anhydrous AlBr₃ yields (328) ethylene dibromide (see also below under reactn. of $\bar{\mathbf{C}}$ with organic cods.).]

Č with boilg. conc. aq. KI gives a little ethylene (329) (dıf. from ethylene dibromide which reacts quant.).

[\bar{C} with aq. alc. Na₂SO₃ refluxed in Cu vessel gives (80-85% yield (330)) of the sodium salt of 2-chloroethanesulfonic acid-1. — For reactn. of \bar{C} with boilg. aq./alc. Na₂S₂O₃ see (331).]

C with alc. AgNO₃ reacts slowly (332); for study of rate see (297).

Reaction of \tilde{C} with misc. non-nitrogenous inorganic reagts. [\tilde{C} with air over CuO at 450° gives (333) phosgene (3:5000). — \tilde{C} with fumg. H₂SO₄ (65–80% SO₃) with or without HgSO₄ yields (334) β -chloroethyl chlorosulfonate + a little bis-(β -chloroethyl) sulfate. — \tilde{C} with dry O₂ in ultra-violet light yields (335) chloroacetic acid (3:1370).]

Reaction of \bar{C} with NH₃ (for reactn. with amines see below). $[\bar{C}$ with conc. aq. NH₃ (336) (337) (338) (339) under press. (340) (341) (342) in pres. of cat. (343) (for use of glass-stoppered press. vessels see (344)), or \bar{C} with dry NH₃ under high press. (345), or \bar{C} with liq. NH₃ (346), yields ethylenediamine [Beil. IV-230, IV₁-(398), IV₂-(676)] always accompanied by higher condens. prods. such as diethylenetriamine, triethylenetetramine, etc. — For rate of reactn. of \bar{C} with NH₃ in 95% EtOH see (296).]

BEHAVIOR OF C WITH ORGANIC REACTANTS

Reactn. of \tilde{C} with aromatic hydrocarbons, aryl halides, or aromatic ethers. [\tilde{C} with aromatic hydrocarbons in the pres. of AlCl₃ leads to various elastoplastics (167) of the polyarylethylene type: e.g., for use in prepn. of AXF type plastics see (171) (172) (347) (348). — For analogous reactn. of \tilde{C} + AlCl₃ with various polychlorobenzenes (249), with xylene (350), with naphthalene (1:7200) (351), or with diphenyl ether (1:7125) (352) see indic. refs.]

Reactn. of \tilde{C} with alcohols, mercaptans, or phenols. \tilde{C} with Na phenolate (271), or with aq. K phenolate refluxed 48 hrs. (353), gives (70-85% yield (353)) ethylene glycol diphenyl ether (1:7235), lfts. from alc., m.p. 98°; note, however, that reactn. of only 1 of the 2 chlorine atoms may (354) lead to β -chloroethyl phenyl ether (3:0165), m.p. 28°, b.p. 217-220° at 760 mm. (355); also that under certain conditions, e.g., \tilde{C} with alc. NaOH + phenol in s.t. at 180-200° for 5 hrs. (356), gives 80% yield phenyl vinyl ether, b.p. 155-

156° (356). — [For reactn. of \tilde{C} with aq. 2,4-dichlorophenol (3:0560) or with 2,4,6-trichlorophenol (3:1673) at 73-98° for 24-66 hrs. giving respectively 1,2-bis-(2,4-dichlorophenoxy)ethane, m.p. 132-133°, and 1,2-bis-(2,4,6-trichlorophenoxy)ethane, m.p. 167-167.5°, see (357).]

[For reactn. of C with 50% NaOH + cellulose see (358). — C with MeOH over Al₂O₈ at 280° loses HCl yielding (359) vinyl chloride (3:7010) + MeCl (3:7005).]

[For reactn. of "heavy" C, viz., ClCH₂.Cl³H₂Cl, with "heavy" benzyl mercaptan, viz., C₆H₅.CH₂.S³⁴H, see (272).]

Reaction of \bar{C} with salts of organic acids. \bar{C} with salts of acids yields the corresp. ethylene glycol esters; note, however, that reactn. of only 1 chlorine atom can lead to β -chloroethyl esters and that loss of HCl and subsequent formn. of vinyl esters (or their polymers) can sometimes occur.

[E.g., Č with NaCN yields (360) succino (di)nitrile [Beil. II-615, II₁-(265), II₂-(554)], m.p. 53-54° (for rate of reactn. of Č with alc. KCN see (296)). — Č with anhydrous alkali or alk.-earth acetate at 230° in glycol diacetate (361) or monoacetate (364), or in alc. at 160-180° under press. (362), or in pres. of an amine salt as cat. at 175-225° (363), yields ethylene glycol diacetate (1:3511), b.p. 190°.]

Reaction of \tilde{C} with miscellaneous non-nitrogenous org. cpds. [For reactn. of \tilde{C} + AlCl₃ (in CCl₄) with CO at 60-70° and 60-70° atm. press. yielding a mixt. of acid chlorides, ketones, etc., see (365). — For reactn. of \tilde{C} with CS₂ + aq. KOH yielding ethylene glycol trithiocarbonate see (366).]

[$\bar{\rm C}$ (0.5 mole) + ethylene dibromide (0.5 mole) + AlCl₃ (0.015 mole) refluxed 2 hrs. (367) or stood at 25° for 35 hrs. (368) undergoes a redistribution reaction giving a prod. contg. 49.8 mole % 1-bromo-2-chloroethane (ethylene chlorobromide) [Beil. I-89, I₁-(28), I₂-(61)], b.p. 107-108°, $n_D^{2D}=1.4908$ (369). — Similarly $\bar{\rm C}$ (1 mole) + ethyl bromide (2 moles) + AlCl₃ (3%) in steel bomb at 25° for 14 days gives a mixt. contg. five prods. in mole % as follows: $\bar{\rm C}$ 9%, EtCl 34%, ethylene chlorobromide 18%, ethylene dibromide 10%, and EtBr 29% (367).]

[For reactn. of \bar{C} with diethyl sodio-malonate leading to tetraethyl butane-1,1,4,4-tetracarboxylate [Beil. II-862, II₁-(333), II₂-(702)] together with various other prods. see (370) (371).]

Reactn. of \bar{C} with amines. \bar{C} with aniline (4 moles) boiled ¾ hr. yields (372) N,N'-diphenyl-ethylenediamine (1,2-bis-(phenylaminoethane)) [Beil. XII-543, XII₁-(282)], m.p. 64° (373) (corresp. bis-acetyl deriv. m.p. 158°), probably accompanied by some N,N'-diphenylpiperazine [Beil. XXIII-8, XXIII₁-(5)], m.p. 164°. [For nitration of 1,2-bis-(phenylaminoethane) see (372) (373); for nitration of N,N'-diphenylpiperazine see (374). — Note that \bar{C} with NaNHC₆H₅ (from aniline + NaNH₂ in dry ether) loses 2 HCl yielding (375) acetylene.]

[\bar{C} with 33% abs. alc. Me₃N stood 10 days gives (22.5% yield (376)) the corresp. monoquaternary salt, β -chloroethyl-trimethyl-ammonium chloride ("choline dichloride"); for study of rate of reactn. of \bar{C} with Me₃N in 90% acctone at 55° see (377). — For studies of rate of reactn. of \bar{C} with other amines, e.g., with benzylamine (296) (297), piperidine (296) (297) (298), pyridine (298) (378), see indic. refs.]

COLOR REACTIONS OF C

With Weber reagent. Č (2 drops) with 2% soln. of phenolphthalein in cyclohexanol (2 ml.) + trace solid NaOH htd. 5 min. at 190-200° (preferably in bath as directed (379)), then cooled and acidified with AcOH (1 ml.) gives lilac color. [Note that acetylene tetrachloride (3:5750) with this reagt. gives a somewhat similar result.]

Comment on NH₄OH/CuCl reagt. Note that \bar{C} with NH₄OH/CuCl does not (380) give any color (dif. from 1,1-dichloroethane (ethylidene (di)chloride) (3:5035) which in 10 min. gives cloudy amethyst coloration (380)).

Comment on Fehling's soln. Note that \bar{C} does not reduce Fehling's soln. even on htg. (dif. from ethylidene (di)chloride (3:5035)).

- **1,2-Diphenoxyethane** (ethylene glycol diphenyl ether) (1:7235). Lfts. from alc., m.p. 98°. [From \bar{C} with aq. K phenolate refluxed 48 hrs. (70-85% yield (353)); note, however, that if only one of the two chlorine atoms reacts some β -chloroethyl phenyl ether, m.p. 28°, b.p. 217-220° at 760 mm. (355), may be formed.]
- 1,2-Di- α -naphthoxyethane (ethylene glycol di- α -naphthyl ether) [Beil. VI-607]. Lfts. from alc., m.p. 127.5° (381). [From $\tilde{C} + \alpha$ -naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). Note that the half reactn. prod., β -chloroethyl α -naphthyl ether, has m.p. 28° (355).]
- —— 1,2-Di- β -naphthoxyethane (ethylene glycol di- β -naphthyl ether) [Beil. VI-642]. Lfts. from C₆H₆, m.p. 217° (381). [From $\ddot{C} + \beta$ -naphthol + aq. NaOH at 120° in s.t. for 8 hrs. (381). Note that the half reactn. prod., β -chloroethyl β -naphthyl ether, has m.p. 83° (355).]
- DEthylene 1,2-bis-(isothiourea picrate): ndls. from alc., m.p. 260° (382), 259° (332). [From C with thiourea refluxed in alc. and subsequently treated with PkOH (332).]
- D 1,2-Diphthalimidoethane (ethylene diphthalimide) [Beil. XXI-492, XXI₁-(384)]. Ndls. from AcOH, dil. AcOH or alc., m.p. 236° (383), 232-233° (384), 232° (385). [From C + K phthalimide (2 moles) in s.t. at 200° (386); note that C in very large excess with K phthalimide in s.t. at 180-190° for 3 hrs. gives (387) the half reactn. prod., N-(β-chloroethyl)phthalimide, cryst. from CS₂ or alc., m.p. 81° (388), 79-81° (387) (389).]
- 1,2-Disaccharinoethane: m.p. 253-254° (392). [Not reported from C̄ itself, but obtd. (20% yield) from ethylene (di)bromide with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 3 hrs.; note that with shorter reflux (1 hr.) some half reactn. prod., viz., N-(β-bromoethyl)saccharin, m.p. 99°, is formed (392).]

3:5140 3,3-DICHLOROPROPENE-1
$$(1,1-Dichloropropene-2;$$
 allylidene (di)chloride; "acrolein dichloride") CH_2 — CH — CH — CH — CH — I_2 — I_2 — I_3 — I_4 — I_4 — I_5 — I_5 — I_5 — I_5 — I_5 — I_6 —

[See also 1,3-dichloropropene-1 (3:5280).]

85°

Note that C represents the synionic mesomer of 1,3-dichloropropene-1 (3:5280); reactions of either mesomer may under certain conditions lead to derivatives of the other: however, in practice the tendency appears to be strongly in the direction of 1.3-dichloropropene-1 (3:5280) so that most of the known reactions of C yield the same products as does the mesomer; the rate of reaction, however, is generally very much slower with C.

[For prepn. of C from acrolein (1:0115) with PCl₅ (16% yield C accompanied by 32% 1,3-dichloropropene-1 and some 1,1,3-trichloropropane (3:5660) (3)) (1) (4), or from 1.1.3-trichloropropane (3:5660) with alc. KOH (5) (other products are also formed), see indic. refs.]

[C with Cl2 adds 1 mole halogen giving (4) 1,1,2,3-tetrachloropropane (3:6035), b.p. 179-180° at 756.6 mm. (4).]

[C with conc. HCl in s.t. at 100° for 10 hrs. (4) isomerizes to 1,3-dichloropropene-1 (3:5280).]

[\bar{C} with NaOEt reacts much more slowly than its mesomer; however, after 15 hrs. refluxing with large excess NaOEt, \bar{C} gives 1-chloro-3-ethoxypropene [Beil. I-439], b.p. $126-127^{\circ}$, $D_{-}^{16}=1.018$, $n_{-}^{16}=1.438$ (3), i.e., the same product as from the mesomer.]

[\tilde{C} with Na phenolate in abs. alc. refluxed for 4 hrs. gives (3) ω -chloroallyl phenyl ether, the same prod. as correspondingly obtd. in $\frac{1}{2}$ hr. from the mesomer, q.v.]

[\bar{C} with Et₂NH in dry ether for 20 days gives (3) only a slight ppt. of diethylamine hydrochloride and but very small yield of N_iN -diethyl- γ -chloroallylamine (cf. the mesomer).

[C with NaOAc (3), CaBr₂ (3), CaI₂ (3) cf. (6), or C₆H₅MgBr (3) gives more slowly and in poor yields the same products as are formed readily from the mesomeric 1,3-dichloropropene-1 (3:5280), q.v.]

Colorless mobile liquid with sweetish odor suggesting chloroform. — \bar{C} as such is not inflammable (see below).

MISCELLANEOUS PHYSICAL PROPERTIES

Various solubility relationships. \bar{C} is pract. insol. aq. and eas. volatile with steam: soly. of \bar{C} in aq. at $16^\circ = 0.081$ wt. % (23), at $18^\circ = 0.025$ wt. % (23), 0.18 ml. in 100 ml. aq. (24). — Soly. of aq. in \bar{C} at $-30^\circ = 0.0025$ wt. %, at $-20^\circ = 0.0050$ wt. %, at $-8^\circ = 0.0075$ wt. %, at $0^\circ = 0.0100$ wt. %, at $6^\circ = 0.0125$ wt. %, at $10^\circ = 0.0170$ wt. %, at $20^\circ = 0.0250$ wt. %, at $25^\circ = 0.0325$ wt. % (9).

[For data on soly. in \bar{C} of 248 org. cpds. see (25); for solv. actn. of \bar{C} on various dyes (in connection with use of \bar{C} as dry cleaning fluid) see (26) (see also below under uses of \bar{C}).] [For soly. of I_2 in \bar{C} over range 11-25° see (27); for use of such solns. in detn. of I_2 No. of oils and fats see (28). — For distrib. of I_2 between \bar{C} and aq. at 25° see (30) cf. (31).]

[For soly. in \tilde{C} at 20° of HCl or H₂S at 1 atm. see (32).]

[For absorption of vapors of C by kerosene see (33).]

Effect of \bar{C} on explosive range of various gases. Air satd. with \bar{C} at 14° conts. 5.7 vol. (?) % \bar{C} (34).

[Vapor of C does not form inflammable mixts. with air at ord. temp. and press.; below

25.5° $\bar{\rm C}$ has insufficient vap. press. to produce inflam. mixts. at total press. of 1 atm. or above even in mixts. contg. high concns. of O_2 . — At high temps. vapor of $\bar{\rm C}$ is inflammable in air, igniting at 463°; in oxygen at 419° (18). — Limits of inflammability of mixts. of $\bar{\rm C}$ with O_2 are 10.30–64.5 vol. % $\bar{\rm C}$ (35); for study of limits of inflam. of system $\bar{\rm C}/O_2/N_2$ see (18) (35).]

[For study of influence of vapors of \tilde{C} upon explosive regions of mixts. of air with hydrogen (36) (37), with acetylene (36), with methane (38) (39) (36) (40) (41) (42), or with carbon monoxide (34) (36) (43) see indic. refs.]

Adsorption of \tilde{C} by various materials. [For study of adsorption of \tilde{C} on charcoal at 20° (44) and use in detn. of \tilde{C} (45) see indic. refs.; on MnO₂ see (46); on dehydrated Al(OH)₃ gel at 10–40° and desorption at 90–150° as means of recovery of \tilde{C} see (47).]

Other physical properties. [For study of evapn. rate of \bar{C} see (48); for study of thermal conductivity of \bar{C} see (11).]

Binary systems contg. \tilde{C} (see also below under azeotropes). \tilde{C} + MeOH (1:6120): for diag. of b.p./vapor-liq. compn., D/compn., and n/compn. see (49). $-\tilde{C}$ + EtOH (1:6130): for diag. of b.p./vap.-liq. compn., D/compn., and n/compn. see (49). $-\tilde{C}$ + acetone (1:5400): for data on D_4^{25} /compn. and n_D^{25} /compn. see (10).

 \bar{C} + nicotine: for study of distrib. of nicotine between \bar{C} and aq. at 17° see (23).

 $\ddot{C} + CHCl_3$ (3:5050): for f.p./compn. diag., eutectic, f.p. -100.2° , contg. 68.6 wt. % \ddot{C} see (16). $-\ddot{C} + pentachloroethane$ (3:5880): for D_4^{25} /compn. data see (17) cf. (50).

Ternary systems contg. \tilde{C} (see also below under azeotropes). $\tilde{C}+MeOH$ (1:6120) + EtOH (1:6130): for D/compn. and n/compn. diags. see (49b). — $\tilde{C}+EtOH$ (1:6130) + H_2O : for soly./compn. diagram in wt. % at 25° and $n_D^{25}/compn$. diagram in wt. % see (8) cf. (51).

Azeotropic systems contg. \tilde{C} . Binary azeotropes. $\tilde{C} + H_2O$: gives a two-phase constbolig. mixt. (heteroazeotrope), b.p. 73°, contg. 65 mole % \tilde{C} (8).

C + MeOH (1:6120): forms a const.-boilg. mixt., b.p. 60.2° at 760 mm., $D_4^0 = 1.1643$ (52a) contg. 64 wt. % \bar{C} (52a) = 30 mole % \bar{C} (52a) = 51 vol. % \bar{C} (53). — \bar{C} + EtOH (1:6130): forms a const.-boilg. mixt., b.p. 70.9° at 760 mm., $D_4^0 = 1.212$, contg. 73 wt. % $\bar{C} = abt. 48.7 \text{ mole } \% \bar{C} (52b) \text{ cf. } (53) (54). - \bar{C} + n\text{-}propyl alc. } (1:6150): \text{ forms a const.-}$ boilg. mixt., b.p. 81.75° at 760 mm., $D_4^0 = 1.3283$, contg. 83 wt. % $\bar{C} = 69$ mole % \bar{C} (52c). $-\bar{C}$ + isopropyl alc. (1:6135): forms a const.-boilg. mixt., b.p. 75.5° (7), abt. 74° at 760 mm. (52d), $D_4^0 = 1.22$, contg. abt. 72 wt. $\% \bar{C}$ (70 wt. $\% \bar{C}$ (7)) = 54 mole $\% \bar{C}$ (52d). — $\bar{C} + n$ -butyl alc. (1:6180): gives a const.-boilg. mixt., b.p. 86.85° at 760 mm., contg. 97.5 wt. % \bar{C} (55). — \bar{C} + isobutyl alc. (1:6165): forms const.-boilg. mixt., b.p. 85.4° at 760 mm., $D_4^0 = 1.396$, contg. 91 wt. $\% \bar{C} = 86$ mole $\% \bar{C}$ (52e). $-\bar{C} + ter-butyl$ alc. (1:6140): forms const.-boilg. mixt., b.p. 75.8° (6), 75° (52f) at 760 mm., $D_4^0 = 1.326$ (52f), contg. 67 wt. % \bar{C} (6) (84 wt. % \bar{C} (52f) = 74 mole % \bar{C} (52f)). $-\bar{C}$ + ter-amyl alc. (1:6160): forms const.-boilg. mixt., b.p. 84.5° (6), 84° (52g), $D_4^0 = 1.372$ (52g), contg. 86 wt. % \bar{C} (6) (88 wt. % \bar{C} = 83 mole % \bar{C} (52g)). — \bar{C} + allyl alc. (1:6145): forms const. boilg. mixt., b.p. 80.95° at 760 mm., $D_4^0 = 1.335$, contg. 84 wt. $\% \bar{C} = 70$ mole $\% \bar{C}$ (52h). $\bar{C} + AcOH$ (1010): forms const.-boilg. mixt., b.p. 86.5° at 760 mm., contg. 96.2 wt. % Č (6).

 $\bar{C}+1,2$ -dichloroethane (ethylene dichloride) (3:5130); forms a const.-boilg. mixt., b.p. 82.9° at 760 mm., contg. abt. 18 wt. % \bar{C} (6).

Ternary azeotropes. $\ddot{C} + EtOH$ (1:6130) + H₂O: forms a ternary heteroazeotrope, b.p. 67.25° at 760 mm., contg. 38.4 mole % \ddot{C} + 41.2 mole % EtOH + 20.4 mole % H₂O (56a): note that this azeotrope conts. 69.4 vol. % \ddot{C} + 23.8 vol. % EtOH + 6.8 vol. % H₂O (53), and that upon condensation at 15° it separates into two layers, the upper having the composition 0.8 vol. % \ddot{C} + 7.2 vol. % EtOH + 5 vol. % H₂O (total upper layer = 13

vol. %), the lower having the composition 68.6 vol. % \overline{C} + 16.6 vol. % EtOH + 1.8 vol. % H₂O (total lower layer = 87%) (53). — For further discussion and data see also (8) (49).

 \ddot{C} + n-propyl alc. (1:6150) + H_2O : forms a ternary heteroazeotrope, b.p. 71.55° at 760 mm., contg. 51.1 mole % \ddot{C} + 16.6 mole % n-propyl alc. + 32.3 mole % H_2O (566).

 \ddot{C} + allyl alc. (1:6145) + H_2O : forms a ternary heteroazeotrope, b.p. 71.4° at 760 mm., contg. 49.2 mole % \ddot{C} + 17.3 mole % allyl alc. + 33.5 mole % H_2O (56c).

USES OF C

Most of the utility of \bar{C} in industry depends upon its physical properties especially as a solvent; these applications include the dehydration of alcohols and acids, degreasing of metal, wool, and leather, dry cleaning of fabrics, extracting of oils from seeds, etc.; dewaxing of mineral lubricating oils, use as fumigant and insecticide, refrigerant, etc. [For an excellent brief survey of these uses see (57) (58); for further and more recent examples see below.]

Use in dehydration of alcohols. [For use of \tilde{C} in dehydration of EtOH (or MeOH) by azeotropic distn. (Drawinol process) see (8) (49) (53) (59) (60) (61) (62); for patents on this method see (63). — For use of \tilde{C} in denaturing alc. see (64).]

Use in dehydration of acids. [For use of \bar{C} in concn. of AcOH (1:1010) see patents (65) (66). — For sepn. of AcOH (1:1010) from formic acid (1:1005) by distn. of mixt. with \bar{C} , the condensate sepg. into an upper layer of an azeotropic mixt. of \bar{C} + formic acid, the lower layer being \bar{C} see (67).]

Use of \bar{C} for degreasing of metal. [For patents on use as metal degreaser of mixts. of \bar{C} + an alc. + soap (68), \bar{C} + oleic acid (69), \bar{C} + ethylene dichloride (3:5130) (70) (71), or \bar{C} (72) (73) see indic. refs. — For use of \bar{C} + rosin + boiled linseed oil in cleaning and leaving coating preparatory to etching see (74). — Because of great toxicity of \bar{C} (see below) special attention (75) must be given to ventilation of degreasers using it.]

Use of \tilde{C} in dry cleaning of fabrics. Because of its solvent power supported by its low b.p. and non-inflammability \tilde{C} is widely used as dry cleaner's solvent [for general articles from this viewpoint see (76) (77) (78); for patent see (79); for solv. actn. of \tilde{C} on dyes see (26)].

Use of \bar{C} in extraction of fats and oils. [For use of \bar{C} as solv. for extraction see (81) (82) (83). — For use of \bar{C} for extraction of soybean oil (84) including n_D^{25} and D in g/cc. at 77°, 100°, and 122° F. (19) see indic. refs. — For study of losses of \bar{C} in extr. of fats see (85).]

[For use of \bar{C} in detn. of fats in foods (butter, margarine, etc.) see (86) (87).]

[For use of C in detn. of aq. in fats and oils see (88); cf. use of acetylene tetrachloride (3:5750) for this purpose.]

Use of C in dewaxing of mineral lubricating oils. [For articles including use of C for this purpose see (89) (90); for patents see (91).]

Use of \bar{C} as fumigant, insecticide, etc. [For comparative tests of \bar{C} see (92); for patents on such use of \bar{C} (93) or mixts. contg. \bar{C} (94) see indic. refs.]

Use of \bar{C} as component of refrigerating liquids. [For use of \bar{C} with dichloroethylene (3:5030) see (95) cf. (96); for use of \bar{C} or its mixts. in low-temp. cryostats see (16).]

Miscellaneous uses of \bar{C} . [For use of \bar{C} with MeBr (97) or with CCl₄ (98) as fire extinguishing compn. see indic. refs.; for use of \bar{C} as boiler or radiator cleaner (99) or as rust-retarder (100) see indic. refs.; for use of \bar{C} as weed-killer see (101); for addition to liq. HCN to diminish inflammability see (102); in prepn. of starch see (103); in recrystn. of T.N.T. see (104); for use as solv. in ebullioscopy (K = 44.3 per 100 g. solv.) see (105); to replace xylene in histological technique see (106) (107) (108).]

PHYSIOLOGICAL BEHAVIOR OF C

 \bar{C} is one of the more toxic of the group of chlorinated solvents; it is absorbable into the body not only by inhalation but also through the skin (109). — Although full detailed treatment of this aspect of \bar{C} is beyond the scope of this work, yet the following citations will be found useful as lead references for further information.

Toxicity of \tilde{C} . [For important surveys of physiological properties (110), toxicity (111), comparative toxicity of \tilde{C} and CCl_4 (112) see indic. refs.]

[For studies of liver injury by \bar{C} (113), of anemia from \bar{C} (114), of American cases since 1932 of industrial poisoning by \bar{C} (115), or role of impurities in toxicity of \bar{C} (116), of industrial hazards of \bar{C} (117) (118) (119), of relation between toxicity and b.p. (120) see indic. refs. — For other studies of toxicity or of poisoning by \bar{C} see (121)-(130), incl.]

 \bar{C} as narcotic, anesthetic, analgesic, etc. $[\bar{C}]$ has very important use in treatment of trigeminal neuralgia (131) (132) (133); for toxic effects of \bar{C} after long use as antineuralgic see (134); for chem. exam. of \bar{C} for medical use see (21).]

[For use of \bar{C} as an esthetic see (135) (136) (137); for use of \bar{C} in treatment of migraine see (138); for effect on pain threshold see (139); for neural depressing effect (140) and narcotic actn. of \bar{C} (141) (142) (143) (144) see indic. refs.]

[For studies of antiseptic and disinfectant actn. of C see (145) (146) (147) (148) (149) (150) (24).]

Miscellaneous related topics. [From dogs after inhalation anesthesia with \bar{C} from 5-8% of initial \bar{C} is excreted (151) as trichloroacetic acid (3:1150). — For study of anthelmintic actn. of \bar{C} see (152). — For actn. of \bar{C} on alc. fermentation see (153).]

DETERMINATION OF C

By physical methods. For detn. of \tilde{C} (as vapor) by use of the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer (154)) see (155); this instrument will measure \tilde{C} in conens. of 10–2000 p.p.m. and is insensitive to methyl chloride (3:7005), methylene (di)chloride (3:5020), CHCl₃ (3:5050), CCl₄ (3:5100), vinyl chloride (3:7010), ethylene (di)chloride (3:5130), acetylene tetrachloride (3:5750), and to many (but not all) common non-chlorinated solvents such as methyl, ethyl, and amyl alcohols, ethyl acetate, etc.; for details see (155). — For detn. of \tilde{C} in air by adsorption on charcoal see (45).

By chemical methods. Those involving decomposition of \bar{C} and subsequent detn. of resultant chloride ion. One class of these methods involves pyrolytic decomposition of \bar{C} by appropriate htg. (156) (157) cf. (158) (159) cf. (127); note that \bar{C} with air at 900–1000° gives exclusively $CO_2 + HCl$, provided that concn. of \bar{C} is not more than 12 mg. per liter; above this amt. from 2–20% of the total carbon and chlorine are converted to $CO + Cl_2$, but $COCl_2$ (3:5000) is not found up to concns. of 100 mg. \bar{C} per liter (159). — For variation of the pyrolytic method involving burning of \bar{C} (or solns. of \bar{C}) in a lamp see (160) (161) (162) (163) (164).

A second class involves decomposition of \bar{C} by chem. means, e.g., by use of Na + ethanolamine in dioxane (165) (166), or by complete hydrolysis of \bar{C} with excess aq. 25% KOH in s.t. at 150° for 1 hr. (167).

Note that C on oxidn. with CrO₃/H₂SO₄ as directed (168) gives quant. CO₂.

Detn. of \bar{C} by conversion to mercuric trichloroethylenide Hg (CCl = CCl₂)₂. \bar{C} with aq. KOH soln. of Hg(CN)₂ on shaking 24 hrs. at room temp. ppts. (169) Hg(CCl = CCl₂)₂ (for amplification see below under behavior of \bar{C} with inorganic reacts.). — For use of this method in detn. of \bar{C} even in pres. of methylene (di)chloride (3:5020), CHCl₃ (3:5050), CCl₄ (3:5100), 1,2-dichloroethylene (3:5030), or tetrachloroethylene (3:5460) see (169).

Detn. of \bar{C} colorimetrically by use of Fujiwara reaction with pyridine + alkali. \bar{C} with pyridine + aq. alk. gives on short warming a red coloration (similar to but recognizably different from the red-violet color obtd. with CHCl₃) which on further warming changes to orange; for use of this color in detn. of \bar{C} in air (accuracy $\pm 11\%$ except that at conciss of \bar{C} as low as 20 p.p.m. error may be as much as 50%) see (170) cf. (111) (127); for use in detn. of \bar{C} in animal tissue see (171); for table of sensitivity of this test under comparable conditions from \bar{C} as compared with CHCl₃ (3:5050), CCl₄ (3:5100), 1,1,2-trichloroethane (3:5320), 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750), and tetrachloroethylene (3:5460) see (151).

PREPARATION OF C

The principal method of preparation or manufacture of \bar{C} is from 1,1,2,2-tetrachloro-ethane (acetylene tetrachloride) (3:5750) by elimination of 1 HCl (see below), but it is formed as a by-product from various other reactions (see below). — [For general reviews of prepn. of \bar{C} and its relationships with other "chlorinated solvents" see (31) (172).]

From 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750). By pyrolytic loss of HCl (dehydrochlorination). [For prepn. of \tilde{C} from acetylene tetrachloride in s.t. at 300° for 15 hrs. (173), over pumice at 700° (174) or 400-500° (175), over pumice + cat. at 500° (176), over pumice contg. $Cu_3(PO_4)_2$ at 450-500° (177), over ThO_2 below 390° (178), over $BaCl_2$ at 300° (179), over bone char at 300-310° (180), over activated carbon at 200-300° (181), 260° (182), or 500° (176) see indic. refs. — Note claim (183) that forms. of \tilde{C} by dehydrochlorination of acetylene tetrachloride over charcoal at 250-300° is not effective and yield of \tilde{C} diminishes with increase of temp.]

By pyrolytic loss of HCl in pres. of an org. acceptor. [For prepn. of \bar{C} from acetylene tetrachloride (3:5750) or pentachloroethane (3:5880) or 1,1,1,2-tetrachloroethane (3:5555) with acetylene over cat. at 250° (181) cf. (184) or with MeOH over Al_2O_3 at 280° (185) see indic. refs.]

By loss of HCl in pres. of an inorganic acceptor. [For prepn. of \bar{C} from acetylene tetrachloride (3:5750) by htg. with aq. alk. or alk. carbonates (186) in pres. of tetraethylene glycol, etc., as promoter (187), or with aq. Ca(OH)₂ or alk. carbonates (186) (188) (192) (193) (for test of Ger. 171,900 (186) see (190) (191)), or with alc. KOH (194) (195) cf. (173), or with alc. NaOEt (194) see indic. refs.]

[For prepn. of \bar{C} from acetylene tetrachloride (3:5750) by elimination of 1 HCl with excess NH₃ gas in pres. of aq. at 60-70° (196), with conc. aq. NH₄OH at 160-170° (196) (191) (for test of Ger. 351,463 (196) see (191)), with liq. NH₃ at -40° (13) (197), or by refluxing with dry pyridine (198), or by action of C_6H_5MgBr (199) see indic. refs.]

Note on impurities in \bar{C} . Note that tech. \bar{C} obtained from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) by elimination of HCl often contains in its high-boilg. fractions ("Tri-Nachlauf" and "Tetra-Nachlauf") other chlorinated materials such as 1,1,2,3,4,4-hexachlorobutane (3:3155), 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), solid 1,2,3,4-tetrachlorobutadiene-1,3 (3:6150), and hexachloroethane (3:4835), (207). — [For use of these "Nachlaufe" as insecticides and weed-killers see (268).]

From other halogenated ethanes. [For formn. of C from 1,2-dichloroethane (ethylene dichloride) (3:5130) as by-product (29% yield) of action of Cl₂ in pres. of AlCl₃/NaCl/FeCl₃ at 400-480° (200), or as by-product of actn. of Cl₂ in u.v. light (201), see indic. refs.]

[For formn. of \bar{C} from 1-bromo-1,1,2-trichloroethane by elimination of HBr with hot alc. Na phenolate (60% yield) see (245).]

[For formn. of \bar{C} from pentachloroethane (3:5880) with acetylene over cat. at 250° (181), or with H_2 over Ni at 270° (22) (note that \bar{C} resists further hydrogenation; also

that pentachloroethane over NiCl₂ without H₂ yields (22) tetrachloroethylene (3:5460)), or by actn. of MeMgI (203) see indic. refs. — For formn. of \bar{C} from 1,1,2-trichloro-1,2-dibromoethane with H₂ over NI at 300° or without H₂ over BaCl₂ at 400° see (202).]

From miscellaneous sources. \bar{C} is formed as a by-product of actn. of acetylene with Cl₂ but no citations will be given here [for formn. of \bar{C} from chloral (3:5210) with P₂S₅ at 160-170° (204) or from di- or tri-thioparachloral on dry distn. (205), or from 2-(tri-chloroacryloyl)-3-sulfamidobenzoic acid by alk. hydrolytic cleavage (206), see indic. refs.].

CHEMICAL BEHAVIOR OF C

Pyrolysis of Č. [Č passed over pumice at 700° decomposes yielding (174) methylene (di)chloride (3:5020), CHCl₃ (3:5050), CCl₄ (3:5100), 1,1,1,2-tetrachloroethane (3:5555), pentachloroethane (3:5880), hexachloroethane (3:4835), 1,2-dichloroethylene (3:5030), tetrachloroethylene (3:5460), pentachlorobenzene (3:2290), hexachlorobenzene (3:4939), and other prods.]

Hydrogenation. [\bar{C} resists hydrogenation even with H₂ over Ni at 270° (22). — Note, however, that \bar{C} with HI in sunlight for 2 weeks in absence of air at room temp. is partially (25% (245)) reduced to 1,1,2-trichloroethane (3:5330).]

Oxidation. \tilde{C} on total oxidation with CrO_3/H_2SO_4 as directed (168) gives quant. CO_2 . — \tilde{C} over chlorinated CuO at 450° gives $CO_2 + H_2O$ accompanied (209) by some phosgene (3:5000).

[\tilde{C} with O_2 in ultra-violet light (210) (198) (211) or in pres. of cat. (e.g., Br₂, I₂, H₂SO₄, HNO₃, etc.) (212) (213) (214) yields dichloroacetyl chloride (3:5290). — Note that \tilde{C} in absence of O_2 is not decomposed either by direct or diffused sunlight (9).]

[For study of auto-oxidn. of \bar{C} see (215); for study of acidity developed from \bar{C} with air or oxygen over range -23° to 150° see (9).]

 $[\bar{C} \text{ with } O_3 \text{ gives (215) a very unstable ozonide which decomposes into phosgene (3:5000), CO, HCl, and oxides of chlorine.]$

Stabilization. Since in the presence of O_2 (air) \overline{C} has a definite tendency toward oxidation (see above), much study has been given to the problem of its stabilization by addn. of small amts. of other materials. — [For general study of the stability of \overline{C} under a wide variety of conditions see (9); for study of method of testing stability and the efficacy of various stabilizers see (216); for use of 2-3% of EtOH (1:6130) or of cyclohexane (1:8405) as stabilizers see (217).]

For stabilization of \tilde{C} a wide variety of compds. have been recommended in the patent literature [e.g., for use of 0.01% or less of hydroquinone monomethyl ether (1:1435) or hydroquinone monobenzyl ether (1:1539) see (218); for use of 0.1% or less of *p-ter*-butylphenol (1:1510) or *p-ter*-amylphenol (1:1495) see (219); for use of 0.001% *n*-hexylresorcinol (1:1465) see (220); for use of oil-sol. azo dyes contg. phenolic groups see (221); for use of various phenols, amines, and aminophenols see (222) (235); for use of very small amts. alc. NH₃ see (223); for use of trimethylamine (228) di-isopropylamine (224), triethylamine (225) (226), or other alkylamines (226), various nitrogenous cpds. such as dialkylated cyanamides, allylthiourea, hexamethylenetetramine, propionitrile, etc. (227), pyridine (228), caffeine (229), see indic. refs.].

[For stabilization of C with mercaptans, e.g., n-butyl mercaptan (230), with amylene (231) cf. (222), with gasoline (232), with alk. oleate (233), with fatty acids or soaps (234) see indic. refs.]

Polymerization. \bar{C} under certain conditions reacts with itself forming dimeric, trimeric, and prob. polymeric products [e.g., \bar{C} in glass, porcelain, or enameled vessels at 180-210° under press. (236) and in pres. of small amts. of various antioxidants (237) gives a dimer, a hexachlorobutene (b.p. 200° at 710 mm.) of undetermined structure, accompanied by

higher polymers and by hexachlorobenzene (3:4939); \tilde{C} at elev. temp. and press. or under reflux in pres. of peroxides (such as Bz_2O_2) gives (238) (239) mainly dimer, accompanied by some trimer and polymer; \tilde{C} with $AlCl_3$ gives on refluxing (240) a mixt. of resinous polymers suitable (especially in mixts. with trichlorobenzene) for use as electric-insulating material].

[For copolymerization of \bar{C} with various dienes (such as chloroprene (3:7080), etc.) see (241).]

Reaction with halogens. Behavior with fluorine. [\bar{C} with F_2 at 0° for 10 hrs. gives (242) by addition 1,2-diffuoro-1,2,2-trichloroethane, b.p. 72.3-72.6°, $D_4^{20} = 1.5555$, $n_D^{20} = 1.3967$, accompanied by other prods. such as 1-fluoro-1,2-dichloroethylene, and a hexachlorobutene (3:9050), m.p. 9.5-11.0°, b.p. 125.5° at 25 mm., $D_4^{20} = 1.6880$, $n_D^{20} = 1.5442$, which, however, is not 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), etc.]

Behavior with chlorine. \bar{C} under appropriate circumstances adds 1 mole Cl₂ giving pentachloroethane (3:5880) [e.g., for study of addn. of Cl₂ at 80°, 95°, and 115° in light of 4360 Å see (243), note, however, that reaction may go further and that \bar{C} with Cl₂ over activated charcoal at 60-70° either in light or in dark gives (98% yield (244)) hexachloroethane (3:4835)].

Behavior with bromine. \tilde{C} readily adds 1 mole Br₂ (245) (even when used as Br₂ aq. (202)) yielding 1,2-dibromo-1,1,2-trichloroethane, b.p. 204° dec. at 760 mm. (245), 125–126° at 85 mm. (202), 116.5° at 50 mm. (245), $n_D^{20} = 1.5710$ (245). [For study of rate of addn. to \tilde{C} of Br₂ in CCl₄ see (246).]

Behavior with iodine or thiocyanogen. C does not add I₂ (Wijs method) or (SCN)₂ (Kaufmann method) (167).

Behavior with halogen hydrides. Reactn. of \bar{C} with dry HCl. \bar{C} (1 mole) with dry HCl gas (1.57 moles) in pres. of anhydr. FeCl₃ (0.003 mole) in dark 6 days at room temp in abs. of air or peroxides, or \bar{C} (1 mole) with dry HCl gas (1.62 moles) in pres. of AlCl₃ (0.004 mole) in dark 3 days at 0° in abs. of air or peroxides gives exclusively (245) (yields: 49% and 22%, respectively) 1,1,1,2-tetrachloroethane (3:5555). [Note that \bar{C} with dry HCl in pres. of 5-10% AlCl₃ at 30-40° gives (86-88% (247)) 1,1,1,2-tetrachloroethane (3:5555), but that \bar{C} + AlCl₃ with dry HCl at 50° gives also (248) the sym.-1,1,2,2-tetrachloroethane (3:5750), two pentachlorobutadienes (cf. (249)), and hexachlorobenzene (3:4939).

Reaction of \bar{C} with dry HBr. \bar{C} in the pres. of an anti-oxidant does not react with HBr even after several days at 100° or after 30 days in sunlight (245).

However, \bar{C} in the pres. of suitable cat. adds HBr readily, but the mode of addn. differs according to conditions: e.g., \bar{C} + HBr in pres. of small amts. FeCl₃ or AlCl₃ gives exclusively in yields up to 81% (245) 1-bromo-1,1,2-trichloroethane, b.p. 152° at 760 mm., b.p. 54° at 20 mm., $n_D^{20} = 1.5217$ (245); but \bar{C} with HBr in pres. of air and/or peroxides gives exclusively in yields up to 91% 2-bromo-1,1,2-trichloroethane, b.p. 171° at 760 mm., b.p. 68.9° at 20 mm., $n_D^{20} = 1.5302$, $n_D^{14.5} = 1.5326$ (245).

Behavior of \tilde{C} with dry HI. \tilde{C} does not add HI even after 4 days at room temp. in dark and abs. of air; on exposure of the system for 2 weeks in sunlight 25% of \tilde{C} was reduced to 1,1,2-trichloroethane (3:5330) (245).

Behavior with oxygenated mineral acids. Reaction of \bar{C} with H_2SO_4 . $[\bar{C}$ with strong H_2SO_4 at elev. temp. undergoes reactns. leading ultimately (250) (189) to high yields of chloroacetic acid (3:1370). — For patents exemplifying various conditions see (251) (252) (253) (254) (255) (256). — Note also that the H_2SO_4 may be replaced by arom. sulfonic acids such as benzenesulfonic acid, etc. (257).]

[Č with fumg. H_2SO_4 (10% SO_3) shaken at 88° for $\frac{3}{4}$ hrs. gives (258) cf. (255) (259) α -chloro- α -sulfoacetic acid.]

Reaction of \bar{C} with HNO_3 . [\bar{C} with conc. HNO_3 (D=1.42, 4 vols.) refluxed 3 hrs. gives mainly (260) cf. (258) dichlorodinitromethane [Beil. I-78, I₁-(21), I₂-(44)], accompanied by some trichloronitromethane (chloropicrin); for behavior of \bar{C} with N_2O_5 in s.t. at 50° for 6 hrs. see (260).]

Behavior with alkali. \check{C} in either aq. susp. or alc. soln. does not neutralize N/10 aq. alk. (261) (for contrary earlier claim see (262)), but \check{C} with excess 2 N MeOH/KOH in s.t. at 100° for 30 min. uses alk. corresp. to 2 moles, i.e., apparent Sap. Eq. = M.W./2 = 65.8. $[\check{C}$ with aq. alk. or alk.-earth hydroxides at 175° under press. in pres. of copper salts is

claimed (263) to yield salts of glycolic acid (1:0430).]

[\bar{C} with ether passed as vapor with N₂ over solid KOH + CaO at 130° loses HCl giving (84–90% yield (264)) dichloroacetylene (3:5010) in the form of its mol. cpd. (1:1) with ether; for earlier work in which \bar{C} alone over solid granular KOH at 130° gives (65% yield (265)) dichloroacetylene (266) see indic. refs.]

[\bar{C} with EtOH/NaOEt at 60-75° condenses with elimination of NaCl giving (yields: 81% (267), 70% (268)) (269) (204) α,β -dichlorovinyl ethyl ether (3:5540). — Note that reaction of \bar{C} with alc. NaOEt has been accompanied by spontaneous explosions or ignition (270) (271) (272), presumably because of some formn. of either chloroacetylene (3:7000) or dichloroacetylene (3:5010) or both cf. (273).]

[For study of stability of \tilde{C} toward water under various conditions see (9); note that carefully purified \tilde{C} is more stable toward aq. than ord. tech. product (274).]

Behavior with metals. [For study of corrosive actn. of \bar{C} on soft steel, copper, brass, lead, aluminum, etc., at temps. 50-150° under various conditions see (9) (275) (276) (277) (278) (279) (280) (281). — For study of sensitivity to mechanical shock of \bar{C} with Li, Na, K, Ca, Sr, Ba see (282).]

Behavior with inorganic metal salts. With $AlCl_3$. [\bar{C} with $AlCl_3$ (4-5%) on refluxing several hours (249) or \bar{C} at 225-230° under press. in pres. of Fe cpds. (284) undergoes bimolecular condensation with elimination of HCl and forms. of pentachlorobutadienes; see also comments above on reaction of \bar{C} with HCl and remarks below on reaction of \bar{C} with other org. chlorine cpds.]

With AlBr₃. [C with AlBr₃ as directed (283) undergoes halogen interchange giving 1,1,2-tribromoethylene [Beil. I-191, I₁-(81), I₂-(164)], b.p. 163-164°.]

With FeCl₃. [C with anhydr. FeCl₃ in s.t. at 85° yields (215) pentachloroethane (3:5880), but various side reactions result also in some hexachloroethane (3:4835) and tetrachloroethylene (3:5460).]

Behavior with other miscellaneous inorganic reactants. [\bar{C} with excess Cl₂O in CCl₄ at -20° gives (285) pentachloroethane (3:5880), chloral (3:5210), and octachlorodiethyl ether (3:0738). — \bar{C} with nitryl chloride (ClNO₂) in s.t. at 100° for 3 hrs. gives (286) by addn. 1,1,1,2-tetrachloro-2-nitroethane, colorless oil, b.p. 76° at 18 mm. (286). — \bar{C} with S₂Cl₂ in s.t. at 140–150° for some hours (no reaction in open tube) gives mainly (287) pentachloroethane (3:5880).]

[For an attempt to react C with hydrazine hydrate in pres. of solid KOH see (288).]

BEHAVIOR OF C WITH ORGANIC REACTANTS

(See also above under C with alkali.)

Behavior with hydrocarbons. [\bar{C} with C_6H_6 in pres. of Al/Hg yields (289) both 1,1-diphenylethane [Beil. V-605, V₁-(285), V₂-(511)] and 1,1,2,2-tetraphenylethane [Beil. V-739, V₁-(371), V₂-(673)]. — \bar{C} (1 mole) with cyclopentadiene (2 moles) at 175-185° under press. yields (309) a Diels-Alder type adduct, b.p. 158-160° at 11 mm., which with phenyl azide gives (309) a hydrotriazole, m.p. 225-226°.]

Behavior with other halogenated hydrocarbons (for reaction of $\bar{\mathbf{C}}$ with itself see above under polymerization).

With CHCl₃ (3:5050). [C in the pres. of AlCl₃ at 20° adds CHCl₃ to its unsatd. linkage yielding (290) (291) 1,1,1,2,3,3-hexachloropropane (3:6460); note that at higher temp., e.g., 50-60°, yield is greatly diminished and several other prods. (290) are formed.]

With CCl₄ (3:5100). [Č in the pres. of AlCl₃ adds CCl₄ to its unsatd. linkage giving at 20-30° for 48 hrs. (49% yield (292)) (290) (291) 1,1,1,2,3,3,3-heptachloropropane (3:6860).] With 1,1,2-trichloroethane (3:5330). [Č in the pres. of AlCl₃ adds 1,1,2-trichloroethane to its unsatd. linkage, then loses HCl, giving after 7 days at 40° a small yield (293) of 1,1,1,4,4-pentachlorobutene-2 (3:9054) accompanied by much resin.]

With hexachloropropene (3:6370). $[\bar{C}\ (1\ mole)\ with\ AlCl₃ + hexachloropropene (1 mole) in CH₂Cl₂ (3:5020) or CHCl₃ (3:5050) at 30-37° gives (82% yield (294)) 1,1,2,3,3,-4,5,5,5-nonachloropentene-1, colorless liq. with cedar-like odor, b.p. 128° at 2-3 mm., 86° at 0.2 mm., <math>D_{20}^{20} = 1.812$, $n_{20}^{20} = 1.5703$ (294): $\bar{C}\ (2\ moles)\ with\ AlCl₃ + hexachloropropene (1 mole) as directed gives in 5 hrs. at 20° a mixt. of two dodecachloroheptenes (C₇H₂Cl₁₂), one m.p. 94-96°, the other m.p. 58-62° (294).]$

Behavior with paraformaldehyde (1:0080). [\bar{C} with paraformaldehyde in the pres. of conc. H₂SO₄at 20–25°, followed by treatment with aq., yields (295) O=(CH₂.CHCl.COOH)₂; note, however, that \bar{C} with paraformaldehyde + conc. H₂SO₄ + an alkyl hydrogen sulfate (296) or an alcohol (297) (to yield the alkyl hydrogen sulfate) gives the corresp. alkyl esters of α -chloroacrylic acid (3:1445).]

Behavior with organic OH or SH cpds. [\bar{C} with alc. NaOEt (see above under behavior of \bar{C} with alkali) at 60-75° gives (yields: 81% (267), 70% (268)) (269) (204) α,β -dichlorovinyl ethyl ether (3:5540).]

[Č (1 mole) with sodium salt of C_2H_5SH (1 mole) in abs. alc. refluxed 2 hrs. gives (298) both α,β -dichlorovinyl ethyl thioether, b.p. 77–80° at 30 mm., and $C_2H_5S.CH=C(SC_2H_5)_2$, b.p. 135–140° at 20 mm.]

[\tilde{C} (1 mole) with sodium salt of C_6H_5SH (either 1 mole or excess) in abs. alc. refluxed 24 hrs. gives α,β -dichlorovinyl phenyl thioether, b.p. 145–150° at 22 mm. (298).]

Behavior of Č with aromatic amines. With aniline. C (1 mole) with aniline (3 moles) + aq. 15% NaOH (3 moles) refluxed for 40 hrs., and any unreacted components then removed by steam distn., gives (crude yield 64% (288)) N-phenylglycine-(N,N-diphenylamidine), C₆H₅NH.CH₂.C (=N.C₆H₅).NHC₆H₅ [Beil. XII-557] (also known as "Sabanejev's base"), colorless cryst. from AcOEt or by rapid crystn. from hot alc., m.p. 189–190° (288). — [Note that this Sabanejev's base may be hydrolyzed in two distinct stages: e.g., on protracted refluxing with EtOH (288) it splits off 1 mole aniline leaving N-phenylglycine anilide = C₆H₅NH.CH₂.CO.NHC₆H₅ [Beil. XII-556], cryst. from dil. alc., m.p. 112-113° (288); on the other hand the Sabanejev's base (or the N-phenylglycine anilide) on more vigorous treatment, e.g. with boiling aq. Ca(OH)₂, etc., hydrolyzes further yielding N-phenylglycine (N-phenylaminoacetic acid) [Beil. XII-468, XII₁-(263)], m.p. 127-128° (an important starting point for prepn. of indigo). — For patents on the prepn. of N-phenylglycine from C by reactn. with aniline in the pres. of aq. Ca(OH)₂ at 170-180° under press. see (299) (300).]

[The reactn. of \bar{C} with aniline + aq. alk. to form Sabanejev's base (above) is also accompanied by various side reactions, including formn. (29% yield (301)) of 1,1,2-tri-(anilino)ethylene, m.p. 147° dec. (301); for further details on this and other by-products see (301) (302).]

With other aromatic amines. [For analogous behavior of \bar{C} with other aromatic prim. amines in the pres. of aq. alk., e.g., with p-toluidine (288) (302) (303) (note that o-toluidine behaves abnormally while m-toluidine does not react (288)), β -naphthylamine (302) cf.

(288), p-anisidine (288), p-phenetidine (288), p-aminobiphenyl (288), and many others (288) see indic. refs.

COLOR TESTS FOR C

- **P** Color test with α -naphthol (1:1500). \bar{C} with a few drops 2% alc. α -naphthol + conc. H_2SO_4 (2 ml.), shaken, diluted with aq. (1-2 ml.), gives red-peach color (304). [This test was devised especially for detection of \bar{C} in oils or melted fats (2-ml. samples); in olive oil \bar{C} can be detected in 1/2000, and can also be noted in presence of castor oil, grapeseed oil, raw linseed oil, lard, etc. Note, however, that test fails with oils which have been subjected to oxidn., e.g., boiled linseed oil, and its sensitivity is improved by the pres. of reducing agts., e.g., by a trace of Zn dust (304).]
- P Color test with cyclopentanol (1:6412). C (1 drop) with cyclopentanol (2 ml.) + trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85% H₂SO₄, stood 1 min., and shaken gives (305) green color. [Note that this same response is also shown by 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) but not by methylene dichloride (3:5020), CHCl₃ (3:5050), CCl₄ (3:5100), ethylene dichloride (3:5130), pentachloroethane (3.5880), cis (3:5042) or trans (3:5028)-1,2-dichloroethylene, or tetrachloroethylene (3.5460); for sensitivity for C see (305).]
- ② Color test with pyridine and aq. alk. (Fujiwara reaction). See above under detn. of
 C.
- Comment on behavior of C with NH₄OH/CuCl. Note that C with NH₄OH/CuCl does not give blue color within 5 min. (306) (diff. from pentachloroethane (3:5880) q.v.
- Mercury bis-(trichloroethylenide), Hg(—CCl=CCl₂)₂ (see also above under detn. of C̄). C̄ with aq. KOH soln. of Hg(CN)₂ on shaking 24 hrs. at room temp. (169), or C̄ with HgO + NaOEt + KCN in alc. shaken 1 hr. at 40-60° (not higher) (307) (308) cf. (273), gives (yields: 100% (169), 90% (307)) mercury bis-(trichloroethylenide), cryst. from ether or CHCl₃, m.p. 83° (169) (273), 82-83° (242) (note that after recrystn. from alc. a m.p. of 141° (307) has been reported). [For behavior of ordinary 1,2-dichloroethylene with aq. alk. Hg(CN)₂ solns. yielding mercury bis-(chloroactylide) Hg(—C≡CCl)₂, m.p. 185°, see text of that cpd. (3:5030).]

3:5180 DICHLOROACETALDEHYDE Cl $C_2H_2OCl_2$ Beil. I - 613 I_1 -(328) I_2 -(677)

Anhydrous Č is strongly lachrymatory liq.; in s.t. Č can be kept but in open containers it gradually changes to an amorphous polymer, insol. alc. but from which Č can be regenerated at 120° (2) cf. (6).

[For prepn. of \bar{C} from dichloroacetaldehyde diethylacetal (3:6110) by distn. with conc. H_2SO_4 (1) (2) (7) or with benzoic anhydride (1:0595) + a little conc. H_2SO_4 (3) (yield: 81% (5), 78% (8)) see indic. refs.; for prepn. of \bar{C} from chloral hydrate (3:1270) with Al/Hg see (9); for manufacture of \bar{C} from chloroform + formaldehyde with SO_2Cl_2 at 300° (10) or with heat, pressure, and cat. (11) see indic. refs.]

[For formn. of \tilde{C} from α,β,β -trichloroethyl ethyl ether (1), β,β -dichlorovinyl methyl (12) or ethyl (1) ethers on htg. with acids; from β,β,β -trichlorolactic acid or its sodium salt by htg. in CO_2 (13) or warming aq. soln. (14) (22), or from its acetate with ethereal Et₂N followed by warming with aq. (13) (15); from ethyl α -ethoxy- β,β -dichloroacrylate on warming with aq. (16); from dichloropyruvic acid by htg. with aq. (15) see indic. refs.]

[For form. of \bar{C} from acetylene with HOCl (17) or from chloroacetylene (3:7000) with NaOCl (18) see indic. refs.]

 \bar{C} in pres. of conc. H_2SO_4 polymerizes (19) to a cryst. tri (?) mer paradichloroacetaldehyde, m.p. $129-130^\circ$ (19), and eas. sol. alc.; this prod. on htg. in a s.t. at $240-245^\circ$ or with conc. H_2SO_4 at $120-130^\circ$ regenerates \bar{C} . [For use of \bar{C} and this polymer as insecticides see (20).]

Č with 1 mole aq. and cooling yields (1) dichloroacetaldehyde hydrate (3:1085), m.p. 56°.

Č with abs. EtOH yields (1) dichloroacetaldehyde monoethylacetal (dichloroacetaldehyde ethyl alcoholate) (3:5310). [For dichloroacetaldehyde diethylacetal, b.p. 184° see 3:6110.]

 \bar{C} reduces NH₄OH/AgNO₃. — \bar{C} on oxidn. with fumg. HNO₃ yields (21) dichloroacetic acid (3:6208).

[Č with PCl₅ yields (22) 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (which if much HCl is present may be accompanied by $\alpha,\beta,\beta,\alpha',\beta',\beta'$ -hexachlorodiethyl ether (22)).]

 \bar{C} with 1 mole NH₂OH.HCl in aq. soln. yields (23) a liquid oxime, b.p. 67-69° at 17 mm., 40-44° at 2-3 mm. dec.; however, with excess NH₂OH.HCl + Na₂CO₃ \bar{C} yields (14) (16) glyoxal dioxime [Beil. I-761, I₁-(394), I₂-(818), m.p. 177-178° (16), 173° (14).

Č with excess phenylhydrazine yields (24) (25) glyoxal bis-phenylosazone, pale yel. pl. from boilg. alc., m.p. 169-171° (25), 170° (24).

 \bar{C} with 1 mole semicarbazide in alc. yields (26) dichloroacetaldehyde semicarbazone, m.p. 155-156° (26); \bar{C} with 2 moles semicarbazide in aq. soln. gives on boilg. (26) glyoxal bis-semicarbazone, insol. in usual solvents and not melting below 270° (27).

[See also chloral hydrate (3:1270) and chloral ethylalcoholate (3:0860).]

Important note: The chemistry of anhydrous chloral on one hand and that of chloral hydrate on the other is so closely interwoven that the division of material between them in this book is necessarily arbitrary. For instance, there are many reactions actually employing chloral hydrate as the starting point, which by virtue of the simultaneous use of conc. H_2SO_4 are undoubtedly in effect reactions of anhydrous chloral In such cases the allocation of text between the two entries has been influenced by the nature and magnitude of the context. Although cross references have been liberally employed, the texts of both anhydrous chloral and of chloral hydrate should be compared.

MISCELLANEOUS PHYSICAL PROPERTIES

Binary systems contg. \tilde{C} . \tilde{C} with H_2O combines to give chloral hydrate (3:1270) q.v. (for use in this reaction of \tilde{C} in effecting drying of halogen compounds used in fire extinguishers see (20)); for extensive study of system \tilde{C} + aq. see (9).

Č with EtOH (1:6130) combines to give chloral ethylalcoholate (3:0860) q.v.— For analogous reactions of Č with other alcs. see below under chemical behavior of Č.

Azeotropic mixtures containing $\bar{\mathbb{C}}$. A few such systems are known including the following: $\bar{\mathbb{C}}$ with methylcyclohexane (hexahydrotoluene) (1:8410) gives a const.-boilg. mixt., b.p. 94.45° at 760 mm., contg. 57% $\bar{\mathbb{C}}$ (2); $\bar{\mathbb{C}}$ with isobutyl formate (1:3065) gives a const.-boilg. mixt., b.p. 100.1° at 760 mm., contg. 60% $\bar{\mathbb{C}}$ (21); $\bar{\mathbb{C}}$ with *n*-propyl acetate (1:3075) gives a const.-boilg. mixt., b.p. 102.55° at 760 mm., contg. 50.5% $\bar{\mathbb{C}}$ (21); $\bar{\mathbb{C}}$ with nitromethane gives a const -boilg. mixt., b.p. 93° at 760 mm., contg. 65% $\bar{\mathbb{C}}$ (20).

PREPARATION OF C

FROM HALOGEN-FREE STARTING POINTS

From ethyl alcohol. [\bar{C} was first prepared (22) from EtOH (1:6130) by action of Cl₂; for discussion of mechanism of reaction see (23) (24); note that various by-products (25) (26) such as 1,1-dichloroethane (3:5035), 1,2-dichloroethane (3:5130), 1,1,2-trichloroethane (3:5330), β,β,β -trichloroethanol (3:5775), ethyl dichloroacetate (3:5850), and chloroform

(3:5050) have been detected; for patents on prepn. of \tilde{C} (or its hydrate) from EtOH with Cl₂ see (27) (28); for use of Cl₂ in pres. of FeCl₃ see (29).]

From acetaldehyde. [For prepn. of C from acetaldehyde (1:0100) with Cl₂ see (30) (31).]

From other non-halogenated materials. [For formation of \tilde{C} from ethyl formate (1:3000) with SO_2Cl_2 in s.t. at 170° (32) or from starch or sucrose by distn. with $MnO_2 + HCl$ (33) see indic. refs.]

From Halogenated Starting Materials

From chloro-unsaturates. [For formn. of \bar{C} from 1,1,2-trichloroethylene (3:5170) with large excess Cl₂O in CCl₄ at -20° (34) or on oxidn. in pres. of FeCl₃, AlCl₃, TiCl₄, or SbCl₃ as directed (35) see indic. refs.; from chloroacetylene (3:7000) with aq. 30% NaOCl + H₃BO₃ see (36).]

From carbon tetrachloride. [For prepn. of \tilde{C} from CCl₄ (3:5100) with formaldehyde + SO₂Cl₂ + cat. at high temp. (200-500°) and high press. (20-200 atm.) see (404).]

From various chloral derivatives. [For prepn. of \tilde{C} from chloral hydrate (3:1270) by dehydration with conc. H_2SO_4 (note that \tilde{C} is appreciably soluble in conc. H_2SO_4 (9)) or with CaC_2 slowly in cold but rapidly at 100° (37); from chloral ethylalcoholate (3:0860) (or other chloral alcoholates) with conc. H_2SO_4 ; from chloral polymers such as "metachloral" by htg. at 180-200° (38); from trichloroacetaldehyde diethylacetal ("trichloroacetal") (3:6317) above 200° (39) or on distn. with conc. H_2SO_4 (39) (40); from dichloroacetaldehyde diethylacetal ("dichloroacetal") (3:6110) with Cl_2 at 60-70° (41) see indic. refs.]

CHEMICAL BEHAVIOR OF C WITH INORGANIC REACTANTS

GENERAL

[For review of chemistry of \bar{C} and its hydrate (3:1270) see (42).]

REDUCTION OF C

According to the nature of the reagent and the conditions, \bar{C} (or its hydrate) may undergo reduction either at its —CCl₃ group or at its —CHO group.

Reduction at —CCl₃ group [\bar{C} with H₂ + Pd in alc. KOH (43) or with H₂ + Ni + aq. alk. (44) splits off all its halogen as HCl. — \bar{C} with Zn + AcOH (45) (46), with Al + AcOH (75), with Zn + strong HCl (47) (48), with Zn + dil. H₂SO₄ (49) (50), reduces to acetaldehyde (1:0100); because of easy volatility of this product the reaction may be used for the identification and detection of \bar{C} (47) (49) (50), or for detection of \bar{C} in presence of CHCl₃ (3:5050) or of α,α,β -trichloro-n-butyraldehyde ("butyrchloral") (3:5910) (49). — Note that \bar{C} with aq. Zn or Fe powder especially on warming gives (51) CH₄ + MeCl (3:7005) + CH₂Cl₂ (3:5020).]

[$\ddot{\mathbf{C}}$ in aq. with Al/Hg gives (52) dichloroacetaldehyde hydrate (3:1085), while C (as hydrate) on electrolytic reduction (53) gives dichloroacetaldehyde (3:5180) + chloroacetaldehyde (3:7212) + acetaldehyde (1:0100).]

Reduction at —CHO group. [Č with Al(OEt)₃ in abs. EtOH gives (yields: 85% (54), 84% (55), 80% (56)) (57) (58) (59) cf. (60) 2,2,2-trichloroethanol-1 (3:5775); for reduction of Č to this same product using Al isopropylate in isopropyl alc. (61) in pres. of acetaldehyde (yield 72–87% (62)), C₂H₅OMgBr (63), (CH₃)₂CHOMgBr (63), or other metallic isopropylates (64), ZnEt₂ (65) (66), AlEt₃ compd. with ether (88.5% yield (67)) (note, however, that SnEt₄ is not effective (67)), or fermenting yeast (68) (69), see indic. refs.—For formn. of 2,2,2-trichloroethanol-1 (3:5775) during reaction of Č with various RMgX compounds see below under behavior of Č with RMgX cpds.]

OXIDATION OF C

Č or its hydrate (3:1270) on oxidation under appropriate conditions gives trichloroacetic acid (3:1150); under some circumstances extensive decompn. also occurs (see below).

[$\bar{\mathbf{C}}$ on oxidn. with fumg. HNO₃ (70) cf. (71), with HNO₂ (72), with NO₂ at 40-60° (70% yield (73)) or with aq. chlorates + cat. (74) gives trichloroacetic acid (3:1150); for formn. of latter as by-product of action of $\bar{\mathbf{C}}$ with O₂ including comments on inhibitors, etc., see (38) (75).]

[Chloral hydrate (3:1270) on oxidn. with fumg. HNO₃ (63% yield (76)) cf. (72), with KMnO₄ (77) (80), with KClO₃ (78), with aq. chlorates + cat. (74), or with Ca(OCl)₂ (79) gives trichloroacetic acid (3:1150).]

Chloral hydrate (3:1270) reduces NH₄OH/AgNO₃ (81) or Fehling's soln. (for study of sensitivity of this reaction see (82) [for oxidn. of chloral hydrate by HgO, KMnO₄, or CrO₃ see (83); for reduction by chloral hydrate of AgCl, AgBr, AgI, or AgSCN to metallic silver (84) or of alkaline solns. of Au, Ag, Bi, and Cu salts (85) see indic. refs.].

[C in dry C₆H₆ is but slowly attached by silver oxide (86).]

REACTIONS INVOLVING DECOMPOSITION OF C

(See also below under behavior of C with alkalies.)

[\bar{C} with aq. HIO₃ at 100° decomposes yielding (87) CHCl₃ (3:5050) + CO₂ + ICl₃ + I₂. $-\bar{C}$ on chlorine-sensitized (88) or bromine-sensitized (12) photochemical oxidn. with O₂ at 70-90° decomposes yielding (88) (12) COCl₂ (3:5000) + CO + HCl.]

[\overline{C} on thermal decompn. at about 440°C. especially if catalyzed by I_2 (89) or NO (89) (90) gives CHCl₃ (3:5050) + CO.]

[Č with AlCl₃ on htg. gives various products according to conditions; these include tetrachloroethylene (3:5460) (91) (92), pentachloroethane (3:5880) (93), $\alpha,\alpha,\beta,\beta,\gamma,\gamma,\gamma$ heptachloro-n-butyraldehyde ("perchlorobutanal") (94), chloral polymers (especially metachloral (91) (92) (95)), chloralide (3:3510) (92) (94), and others.]

BEHAVIOR OF C WITH HALOGENS

With chlorine. [\bar{C} with Cl_2 in sunlight decomposes giving (96) CCl_4 (3:5100) + CCl_2 (3:5000) + CCl_2 (3:5000) + CCl_2 at 70-90° giving CCl_4 (3:5100) + CCl_2 + CCl_2 + CCl_2 with Cl_2 at 70-90° giving CCl_4 (3:5100) + CCl_2 + CCl_2 + CCl_2 + CCl_2 with Cl_2 , CCl_2 (3:5100) + CCl_2 + CCl_2 with CCl_2 + CCl_2 (3:5100) + CCl_2 + CCl_2 with CCl_2 + CCl_2 with CCl_2 + CCl_2 (3:5100) + CCl_2 + CCl_2 with CCl_2 with CCl_2 + CCl_2 with CCl_2 with CCl_2 + CCl_2 +

With bromine. [\ddot{C} with Br₂ at 150° gives (99) trichloroacetyl bromide + bromotrichloromethane + CO + HBr; for extensive study of photochem. reaction of \ddot{C} with Br₂ at 70-90° giving bromotrichloromethane, CHCl₃ (3:5050), COBr₂, CO + HBr see (13).]

BEHAVIOR OF C WITH INORGANIC ACIDS

Č with inorganic acids reacts in various ways according to circumstances; e.g., by formn. of addn. products, by decomposition, by formation of chloralide, by polymerization (see also its own heading below), or by combinations of these reactions.

With HCl. [\bar{C} with HCl gas at -15 to -75° yields (100) (113) an addn. product \bar{C} .HCl commonly designated as chloral hydrochloride; this crystn. product with aq. dissociates giving \bar{C} (as hydrate) + HCl; note that little, if any, polymerization occurs (100).]

With HBr. [C with HBr gas at -15° yields (100) an addn. prod.; C.HBr, similar in behavior to that of the preceding HCl addn. product.]

With HNO₃. [Č with HNO₃ at 20° yields (101) an addition prod., C.HNO₃.]

With H_2SO_4 . [\bar{C} with fumg. H_2SO_4 contg. 2% SO_3 gives on warming substantially 100% yields (102) of chloralide (3:3510); note, however, that \bar{C} with fumg. H_2SO_4 contg.

10% SO₂ gives at 0° an addn. prod. of the type C_m .(SO₃)_n.(H₂O)_p which on warming dec. giving $COCl_2$ (3:5000) + SO₂Cl₂ + SO₂ + CO₂ + CO + HCl (102); for other (older) refs. on conversion of \bar{C} with fumg. H₂SO₄ to chloralide (3:3510) see (61) (81) (103) (104); for conversion of chloral hydrate (3:1270) with fumg. H₂SO₄ to chloralide (3:3510) (yields: 61% (105), 44-51% (106)) see indic. refs. — Note, however, that within a narrow range of strength (best about 79.8%) H₂SO₄ appears to give with \bar{C} or its hydrate certain unstable addition products of type $CCl_3.CH(OH).SO_2OH.H_2O$ (148).]

With CISO₃H. [\bar{C} with chlorosulfonic acid at 50° for several days gives (65% yield (107)) bis- $(\alpha,\beta,\beta,\beta$ -tetrachloroethyl) ether (3:0738); note that even at -50° for 10–12 hrs. yield of this prod. may be as high as 50%; also that various other products including chloralide (3:3510) are also formed; and finally that \bar{C} with FSO₃H behaves similarly (107).]

POLYMERIZATION OF C

 \bar{C} is known to give at least three polymers; the oldest and most common polymer is that designated as "metachloral"; in addition two isomeric α - and β -"parachlorals" (possibly comprising a pair of cis-trans stereomers) have also been reported (108).

Metachloral. [\bar{C} in presence of H₂SO₄ below 0° (108) (sometimes suddenly cf. (109)), fumg. H₂SO₄ (18), pyridine (18), or AlCl₃ as directed (18) (92) (110) gives metachloral [Beil. I-618, I₁-(329), I₂-(680)], a white amorphous polymer of unknown mol. wt. or structure. This polymer is insol. aq., alc., ether, or acids but dissolves in aq. Na₂CO₃ forming chloral hydrate (3:1270), on distn. at 180° regenerates \bar{C} , oxidizes with HNO₃ to trichloroacetic acid, with alkalies behaves like \bar{C} (see also below), and with ClSO₃H at 50° gives (107) bis-(α,β,β,β -tetrachloroethyl) ether (3:0738).]

Parachloral. [\bar{C} with a large excess conc. H_2SO_4 at 15–20°, carefully dissolved and stood 3 days at 15–20°, gives in addn. to metachloral (above) and chloralide (3:3510) small amts. of two isomeric trimers, viz., α -parachloral, rhombs from hot alc., m.p. 116°, b.p. 223° at 760 mm., and β -parachloral, pr. from alc., m.p. 152°, b.p. 250°. Note that yield of parachloral is only about 1% of original \bar{C} , that both are more sol. in hot alc. than the main prod. metachloral, that neither form is convertible to the other or to metachloral, and that both on distn. at ord. press. dissociate to \bar{C} .]

Mixed polymers. [\bar{C} (1 mole) with acetaldehyde (3 moles) + HCl gas at 0° for 15-20 hrs. gives (78% yield (111)) 2,4-dimethyl-6-(trichloromethyl)-1,3,5-trioxane, b.p. 97° at 13 mm., $D_4^{16} = 1.3915$, $n_D^{16} = 1.4708$. Similar mixed polymers (presumably analogous to the preceding case) are similarly formed (112) from \bar{C} with trimethylacetaldehyde (1:0133), \bar{C} with propionaldehyde (1:0110), and \bar{C} with isobutyraldehyde (1:0120).]

Behavior of \tilde{C} with alkalies. \tilde{C} with conc. aq. alkalies (even in cold (22)), or \tilde{C} on distn. with aq. alkalies or alk. earths (22) (114) (115), undergoes cleavage into CHCl₃ (3:5050) + the corresp. salt of formic acid (1:1005); this cleavage is claimed to occur also even with conc. NH₄OH (114) or aq. amines (114) and may also produce some CO (114) and chloride ion. — [For extensive studies of kinetics of this cleavage see (116) (117) (118) (119) (120) (121) (122) (126).]

Note that \tilde{C} is very stable toward hydrolysis by aq. (126) (even in s.t. at 190-200° for 2 hrs. (118)) or by dilute acid (even in s.t. at 150° (118)); however, \tilde{C} with aq. in sunlight is claimed (123) to give formaldehyde (1:0145) + CO_2 + HCl (presumably by formn. and decompn. of OCH.C(OH)₃), and C with aq. is claimed (124) to undergo slight formn. of dichloroacetic acid (3:6208) + HCl.

 \overline{C} with alc. KOH gives (125) CHCl₃ (3:5050) + ethyl formate (1:3000).

[Note that chloral deuterate, $CCl_2CH(OD)_2$ (from $\tilde{C}+D_2O$), with NaOD (17) or Ca-(OD)₂ (127) in D₂O gives deuteriochloroform, CDCl₃, b.p. 0.5° higher than ord. CHCl₃

(3:5050), m.p. -64.69 to -64.15° , $D_4^{20} = 1.5004$ (higher than 1.4888 for CHCl₃), $n_D^{20} = 1.4450$ (same as CHCl₃) (17).]

BEHAVIOR OF C WITH AMMONIA, HYDROXYLAMINE, HYDRAZINE, ETC.

With NH₃. [C̄ with dry NH₃ gas (81) (48) in dry CHCl₃ (128) (129) or chloral hydrate (3:1270) with NH₃ in dry ether (129) gives a white solid, m.p. 72-74° (129), 62-64° (128), originally (81) (48) (128) regarded as chloralammonia CCl₃.CH(OH).NH₂ but later (on discovery of double the expected mol. wt. (129) cf. (130)) thought to have structure CCl₃.CH(OH).NH.CH(NH₂).CCl₃.H₂O. — The prod. with KCN in conc. aq. NH₄OH gives (93% yield (131)) dichloroacetamide, m.p. 98.5-99.0° (131).]

[Note that chloral hydrate (3:1270) with NH₄OAc at 100° gives (132) a prod., cryst. from alc., m.p. 97°, regarded as a dimeric form [Beil. XXIII-15] of chloralimide, CCl₅—CH=NH; this dimer is also accompanied (132) cf. (133) by two stereoisomeric trimers [Beil. XXVI-9-10] of chloralimide.]

With hydroxylamine. The behavior of C with hydroxylamine differs according to the circumstances employed.

[Č as chloral hydrate (3:1270) with large excess NH₂OH.HCl (4 moles) in a little aq. (134) or with NH₂OH.HCl (1 mole) in pres. of conc. aq. CaCl₂ (2 moles) at 50-60° (135) gives trichloroacetaldoxime, m.p. 56° (135), 39-40° (134), b.p. 85° at 20 mm. (135).]

[C as chloral hydrate (3:1270) with NH₂OH.HCl (3 moles) in aq. Na₂CO₃/aq. NaOH as directed (136) (137) gives (yields: 50% (137), 40% (136) (138)) the alkali-stable form of chloro-oximino-acetaldehyde oxime ("chloroamphiglyoxime") [Beil. III-605, III₁-(216), III₂-(393)], ndls. of monohydrate from boilg. aq., m.p. 114° (136) (138) cf. (137); note that this prod. in dry ether with HCl gas (136) or with fumg. HCl (138) isomerizes to the acid-stable form ("chloroantiglyoxime") [Beil. III-606, III₁-(216), III₂-(393)], m.p. 161° (138), 161° dec. (136).]

[Note, however, that chloral hydrate (3:1270) (1 mole) with NH₂OH.HCl (2 moles) powdered with dry Na₂CO₃ (1 mole), allowed to stand in a desiccator some hours, then dissolved in aq. and extracted with ether gives (139) an addition product, cryst. from ether, CHCl₃, or C₆H₆, m.p. 98°, regarded as chloralhydroxylamine, CCl₃.CH(OH).NH.OH.]

[For behavior of \tilde{C} with NH₂OH.HCl + aniline giving isatin see below under reaction of \tilde{C} with primary aromatic amines.]

WITH HYDRAZINE

[C as chloral hydrate (3:1270) with hydrazine hydrate in aq. (140), ether (141), or AcOH (142), or merely fused with hydrazine hydrochloride or sulfate (143), appears to give first the expected addition product, viz., chloralhydrazine, CCl₃.CH(OH).NH.NH₂, ndls. from alc., m.p. 100° (141), 85° dec. (140); note, however, that this structure is not certain and that the material readily changes to a compound C₄H₂ON₂Cl₅, m.p. 187° cf. (140) (141) (142) (143).]

BEHAVIOR OF C WITH MISCELLANEOUS INORGANIC REACTANTS

With various compounds of phosphorus. [Č with PCl₅ in acetone gives a product regarded (144) cf. (145) as CCl₃.CH OPCl₃, b.p. 238-242°, accompanied by tetrachloroethylene (3:5460) and pentachloroethane (3:5880).]

[Č with PCl₃Br₂ is claimed (146) to give 1,1-dibromo-2,2,2-trichloroethane [Beil. I-93, I_{2} -(65)], b.p. 93-95° at 14-15 mm., $D_{4}^{19.5} = 2.295$, $D_{5}^{26.7} = 1.52991$ (146).]

[\tilde{C} with P_2S_5 in s.t. at 160-170° gives (147) a complicated reaction mixture from which only trichloroethylene (3:5170) has been identified.]

With various salts of inorganic acids (for KCN see further below).

With alkali bisulfites (or sulfites). [C or its hydrate (3:1270) with aq. alk. bisulfites (81) (149) reacts readily; for discussion of products see (81) (150) (151).]

With hydrogen peroxide. [\bar{C} with H_2O_2 in ether (151), or \bar{C} with $K_2S_2O_8 + H_2SO_4$ at ord. temp., gives (152) "dichloral peroxide hydrate," viz., CCl₃.CH(OH)—O.O.CH(OH).-CCl₃, cryst. from C_6H_6 or CHCl₃, m.p. 122° dec.]

CHEMICAL BEHAVIOR OF C WITH ORGANIC REACTANTS

BEHAVIOR OF C WITH HYDROCARBONS

With alkanes. [C with aliphatic hydrocarbons in presence of AlCl₃ reacts violently, but no definite products have been isolated (153).]

With aromatic hydrocarbons. \bar{C} with aromatic hydrocarbons in presence of H_2SO_4 or other condensing agent (note that, when H_2SO_4 is present in large excess, chloral hydrate (3:1270) is frequently substituted for \bar{C}) reacts in either or both of two modes: \bar{C} with 1 mole of hydrocarbon giving trichloromethyl-aryl-carbinols, \bar{C} with 2 moles of hydrocarbon giving 1,1,1-trichloro-2,2-diarylethanes. Although reaction of \bar{C} with hydrocarbons cannot here be summarized for all possible cases, yet the following examples will exemplify both modes of reaction.

[C with C_6H_6 + AlCl₃ (154) (156) or chloral hydrate (3:1270) with C_6H_6 + AlCl₃ (153) cf. (158) (162) or with C_6H_6 + conc. H_2SO_4 (155) gives trichloromethyl-phenyl-carbinol [Beil. VI-476, VI₁-(237)], m.p. 37° (155), b.p. 145° at 15 mm. (155) (corresp. acetate, m.p. 87.5° (155); corresp. benzoate, m.p. 97.5° (155); corresp. p-nitrobenzoate, m.p. 109° (156)) accompanied (155) by 1,1,1-trichloro-2,2-diphenylethane (3:1420), the latter also obtainable from $C + C_6H_6$ with conc. H_2SO_4 (157) or with AlCl₃ in CS_2 (80% yield (162)).]

[\bar{C} with toluene + AlCl₃ (154) or chloral hydrate (3:1270) (3 moles) with toluene (1 mole) + conc. H₂SO₄ (155) gives trichloromethyl-p-tolylcarbinol [Beil. VI-508, VI₁-(255)], m.p. 63-64° (154), 63° (155), 61.5-62.5° (159), 58-59° (160); b.p. 155° at 13.5 mm. (155), 154-156° at 13.5 mm. (154) (corresp. acetate, m.p. 107.5° (155), 105-106° (160); corresp. benzoate, m.p. 100.5° (155), 94-95° (160)). — On the other hand \bar{C} with toluene (2 moles) in pres. of H₂SO₄ (161), or AlCl₃ (153) in CS₂ at 0° (162) gives (80% yield (162)) 1,1,1-trichloro-2,2-b1s-(p-tolyl)ethane [Beil. V-619, V₁-(292), V₂-(522)], m.p. 89° (161) (162) (155), also obtained as by-product of the above carbinol (155); for study of loss of HCl with alc. KOH yielding 1,1-dichloro-2,2-di-(p-tolyl)ethylene [Beil. V-648, V₂-(559)], m.p. 92° (161), 85° (162) see (161) (162) (163).]

[For generally analogous behavior of \bar{C} with other aromatic hydrocarbons such as terbutylbenzene (405), m-xylene (153) (163), ethylbenzene (155), naphthalene (164), anthracene (164), or phenanthrene (164) in presence of condensing agents see indic. refs.]

BEHAVIOR OF C WITH ARYL HALIDES

With chlorobenzene. [That \ddot{C} with chlorobenzene (3:7903) (1 mole) + conc. H₂SO₄ gives the expected trichloromethyl-p-chlorophenyl-carbinol, b.p. 187-188° at 26 mm. (165) (corresp. acetate, m.p. 120-121° (165); corresp. benzoate, m.p. 128-129° (165)), has never been reported, this prod. having been obtd. only by condensation of p-chlorobenzaldehyde (3:0765) with CHCl₃ (3:5050) in pres. of KOH (23.5% yield (165)).

However, C or chloral hydrate with chlorobenzene (2 moles) + conc. H₂SO₄ gives the

extremely important 1,1,1-trichloro-2,2-bis-(p-chlorophenyl)ethane ("DDT") (3:3298) whose text should be consulted for further details.

With bromobenzene. [That \bar{C} with bromobenzene (1 mole) + conc. H_2SO_4 gives the expected trichloromethyl-p-bromophenyl-carbinol, b.p. 183-187° at 18 mm. (166) (corresp. acetate, m.p. 145-147° (166)), has never been reported, this product having been obtd. (29% yield (166)) only by reaction of \bar{C} with p-Br.C₆H₄.MgCl.]

[However, \bar{C} or chloral hydrate (3:1270) with bromobenzene (2 moles) + conc. H₂SO₄ + fumg. H₂SO₄ gives (167) (168) 1,1,1-trichloro-2,2-bis-(p-bromophenyl)ethane, m.p. 144° (167), 139-141° (168); note that this prod. with alc. KOH loses HCl, giving (82% yield (167) (168)) 1,1-dichloro-2,2-bis-(p-bromophenyl)ethylene, m.p. 123.5° (167), 119-120° (168).]

With iodobenzene. [The carbinol to be expected from \bar{C} with iodobenzene (1 mole) + conc. H₂SO₄ has not been reported.]

[However, \tilde{C} with iodobenzene (2 moles) + conc. H₂SO₄ gives (155) 1,1,1-trichloro-2,2-bis-(p-iodophenyl)ethane, m.p. 172° (155).]

BEHAVIOR OF C WITH ORGANIC HYDROXY COMPOUNDS

With Alcohols

General. Since \bar{C} is an aldehyde, it may be expected (at least with the assistance of a condensing agent such as dry HCl) to react with 1 mole of an alcohol to yield the corresponding hemiacetal, CCl₃.CH(OH)R, with 2 moles of an alcohol to give the corresponding acetal, CCl₃.CH(OR)₂, particularly since both these types of products are well known.

However, the special influence of the —CCl₃ group becomes apparent in this reaction and only the first type (hemiacetals) are usually obtained by direct condensation, the latter (acetals) being obtained indirectly. Moreover, members of the first group (hemiacetals) are formed with extreme ease (even in absence of condensing agents) so that, by analogy to the combination of chloral with water to give chloral hydrate (3:1270), they are generically designated as chloral alcoholates; e.g., chloral methylalcoholate, chloral ethylalcoholate, etc. Corresponding reaction of several molecules of chloral with multihydric alcohols can also occur as illustrated below.

The formation of these chloralalcoholates is profoundly influenced by conditions (especially the solvent (169)); furthermore, they readily dissociate into their original components on heating and, therefore, on heating in other alcohols (170) (171) or orthoformate esters of other alcohols (170) suffer reactions involving redistribution of the various alkyl radicals.

With monohydric alcohols. Although reaction of \bar{C} with all possible monohydric alcohols obviously cannot be included here, the following examples will serve to exemplify the reaction.

With methyl alcohol. [C with MeOH (1:6120) (1 mole) gives (171) (172) (173) (174), trichloroacetaldehyde monomethylacetal (chloral methylalcoholate), hygroscopic ndls., m.p. abt. 50° (172), 38° (171), b.p. 116° (173), 106° (172), 98° (174) (corresp. carbamate, m.p. 121° (175)). — Note that trichloroacetaldehyde dimethylacetal, CCl₃.CH(OCH₃)₂ [Beil. I-621, I₂-(681)], b.p. 183.2° cor. (176), 68-69° at 10 mm. (177), is obtd. by indirect means; note incidentally that this acetal is isomeric with butyrchloral hydrate (3:1905) and with chloral ethylalcoholate (3:0860).]

With ethyl alcohol. [Č with EtOH (1:6130) gives trichloroacetaldehyde monoethylacetal (chloral ethylalcoholate) (3:0860), q.v. for details. For the corresp. acetal, viz., trichloroacetaldehyde diethylacetal, CCl₃.CH(OC₂H₅)₂, b.p. 204°, see its own text as 3:6317.

With n-propyl alcohol. [\bar{C} with n-PrOH (1:6150) (178) (171) (170), or with NaO-n-Pr (179) or chloral hydrate (3:1270) with n-PrOH (1:6150) (170) gives (yields: 90% (178), 77-90% (170)) trichloroacetaldehyde n-propylhemiacetal (chloral n-propylalcoholate), liquid, b.p. 119-121° at 742.4 mm. (170), 120-122° (178), $D_4^{25.7} = 1.2996$ (170), $D_5^{25} = 1.4622$. (Note that the corresp. trichloroacetaldehyde di-n-propylacetal is unreported.)]

With isopropyl alcohol. [C with iso-PrOH (1:6135) (178) (171) gives trichloroacetaldehyde isopropylhemiacetal (chloral isopropylalcoholate), m.p. 47° (178), 45° (171); b.p. 108° (178) (note that the corresp. trichloroacetaldehyde di-isopropylacetal is unreported).]

With n-butyl alcohol. [C with n-BuOH (1:6180) gives (171) (179) (170) trichloro-acetaldehyde n-butylhemiacetal (chloroal n-butylalcoholate) (3:0843), m.p. 49-50° (180), 49° (171) (170); b.p. 129-130° at 742 mm. (170) (note that corresp. trichloroacetaldehyde di-n-butylacetal is unreported).]

With isobutyl alcohol. [C with iso-BuOH (1:6165) gives (180) trichloroacetaldehyde isobutylhemiacetal (chloral isobutylalcoholate), liquid, b.p. 122° without decompn. (180); note that trichloroacetaldehyde df-isobutylacetal, b.p. 241.8° at 760 mm. (181), has been prepared indirectly).]

With sec-butyl alcohol. [Č with butanol-2 (1:6155) gives (180) (171) trichloroacetaldehyde sec-butylhemiacetal (chloral sec-butylalcoholate), m.p. 12° (171), b.p. 120-121° (180); note that the corresp. trichloroacetaldehyde di-sec-butylacetal is unreported.]

With ter-butyl alcohol. [C with ter-butyl alc. (1:6140) gives (171) trichloroacetaldehyde ter-butylhemiacetal (chloral ter-butylalcoholate), m.p. 43° (171) (note that the corresp. trichloroacetaldehyde di-ter-butylacetal is unreported).]

With other monohydric alcohols. [For analogous forms, of hemiacetals from \bar{C} with isoamyl alc. (1:6200) (180), with ter-AmOH (1:6160) (171), with allyl alc. (1:6145) (99), with n-octyl alc. (1:6255) (171), with benzyl alc. (1:6480) (171), with cinnamyl alc. (1:5920) (171), with methyl-neopentyl-carbinol (182), or with β,β,β -trichloro-ter-butyl alcohol ("Chloretone") (3:2662) (183) see indic. refs.]

With dihydric alcohols. With ethylene glycol. [\bar{C} (1 mole) with ethylene glycol (1:6465) (1 mole) at 0° for 2 weeks gives (184) cf. (185) trichloroacetaldehyde (β -hydroxyethyl)-hemiacetal ("chloral ethyleneglycolate"), m.p. 50–51° (184), 42° (185); note that this product with conc. H₂SO₄ on stdg. or htg. loses 1 H₂O with ring closure to the cyclic acetal, 2-(trichloromethyl)-1,3-dioxolane, m.p. 40° (184). — However, \bar{C} (2 moles) with ethylene glycol (1:6465) (1 mole) gives (186) cf. (185) ethylene glycol 1,2-bis-(β , β , β -trichloro-methyl)-1,3-dioxolane, m.p. 42° (186).]

With polyhydric alcohols. With glycerol. [For behavior of \bar{C} with glycerol (1:6540) see (186) (184).]

With erythritol. [For behavior of C with erythritol (1:5825) see (186).]

With various carbohydrates. C combines with various polyhydroxy compounds of the carbohydrate type to give products collectively designated as chloraloses. Such combinations can be effected with pentoses or hexoses, with various stereoisomers within any such group, and more than one molecule of chloral per mole of carbohydrate is sometimes involved. In the light of modern work these chloraloses are probably cyclic acetals. Although space cannot here be taken for an extensive record, the following comments will serve as starting points for further exploration.

The most important chloralose is that derived from d-glucose and often indexed as glucochloralose. Two forms of this compound are known, viz., α -glucochloralose and β -glucochloralose; for important studies of their structures see (187) (188). For study of β -xylochloralose see (189).

For important (but older) factual data on chloraloses see (190) (191) (192).

Although the biochemical and physiological aspects of the chloraloses cannot be treated here, attention is called to several recent papers (193) (194) (195) (196) relative to their detection and determination, especially in body fluids.

WITH PHENOLS

Because in phenois there is involved not only the H of the OH group but also reactive H of the aromatic nucleus, their condensation with Č may lead to various products according to circumstances.

With monohydric phenols. With phenol. [\bar{C} (1 mole) with phenol (1:1420) (1 mole) + small amt. dry K_2CO_3 in CHCl₃ gives (7.5% yield (148)) trichloroacetaldehyde phenylhemiacetal, m.p. 15-18°, and rather unstable (148); note that the corresp. trichloroacetaldehyde diphenylacetal is unreported. — However, \bar{C} with phenol + dry K_2CO_3 as directed (197) (198), or chloral hydrate (3:1270) with phenol + dry K_2CO_3 on fusion and long stdg. (199), gives trichloromethyl-(p-hydroxyphenyl)-carbinol (corresp. diacetate, m.p. 155° (198), corresp. dibenzoate, m.p. 132° (198)).]

[Č (1 mole) with phenol (1:1420) (2 moles) in AcOH/H₂SO₄ (200) cf. (199) or in pres. of AlCl₃ (153), or chloral hydrate (3:1270) (1 mole) with phenol (1:1420) (2 moles) + conc. H₂SO₄ (201) (202), gives (80% yield (201)) 1,1,1-trichloro-2,2-bis-(p-hydroxyphenyl)-cthane [Beil. VI-1006, VI₁-(491)], m.p. 212° (153), 202° (201) (199), 202° dec. (200), 199–200° (202).]

[For different behavior of \tilde{C} in large excess with phenol (1:1420) + conc. H₂SO₄ see (207).]

With p-cresol. [\bar{C} (1 mole) with p-cresol (1:1410) (1 mole) + dry K₂CO₃ in CHCl₃ gives (35% yield (148)) cf. (203) trichloroacetaldehyde p-tolyhemiacetal, m.p. 52-56° (203), 46-47° (48); note, however, that the corresp. trichloroacetaldehyde di-p-tolylacetal is unreported. — However, \bar{C} (1 mole) with p-cresol (1:1410) (1 mole) + dry K₂CO₃ as directed (197) (198) (199), or chloral hydrate (3:1270) + p-cresol + dry HCl (148), gives trichloromethyl-(2-hydroxy-5-methylphenyl)-carbinol, m.p. 147-148° (197) (199) (148) (corresp. diacetate, m.p. 106° (198) 104.5° (148); corresp. dibenzoate, m.p. 139° (198)).]

[Note that chloral hydrate (3:1270) with o-cresol (1:1400) or with m-cresol (1:1730) + conc. H₂SO₄ gives (202) products presumably to be regarded respectively as 1,1,1-trichloro-2,2-bis-(4-hydroxy-3-methylphenyl)ethane, m.p. 121-122°, and as 1,1,1-trichloro-2,2-bis-(4-hydroxy-2-methylphenyl)ethane, m.p. 162-163°, although no other record of these compounds is reported.]

With other monohydric phenols. [For hemiacetal formn. in pres. of K_2CO_3 or $N_{a_2}CO_3$ from \tilde{C} + other phenols, such as o-methoxyphenol (guaiacol) (1:1405) (197) (198) (199) o-ethoxyphenol (1:1745) (204), 2,6-dimethoxyphenol (205) (206), o-chlorophenol (3:5980) (197), p-chlorophenol (3:0475) (197), see indic. refs.]

With polyhydric phenols: [For hemiacetal formns. in pres. of K_2CO_3 from \bar{C} with polyhydric phenols, such as pyrocatechol (1:1520) (198) (199), resorcinol (1:1530) (198) (199), see indic. refs.]

BEHAVIOR OF C WITH ORGANIC SH COMPOUNDS (MERCAPTANS AND THIOPHENOLS)

 \ddot{C} with RSH compds. in pres. of dry HCl combines mole for mole yielding monothiohemiacetals of the type CCl₈.CH(OH).SR. [e.g., for behavior of \ddot{C} in dry C₆H₆ + dry HCl with ethyl, *n*-butyl, and benzyl mercaptans, or with thiophenol, *p*-chlorothiophenol or *p*-thiocresol, see (8); for study of vapor-phase reaction of \ddot{C} + mercaptans see (208).]

BEHAVIOR OF C WITH PHENOL ETHERS

With Ethers of Monohydric Phenols

With phenyl methyl ether (anisole). [\bar{C} with 2 moles anisole (1:7445) + conc. H₂SO₄ or AlCl₈ (153) (162) or chloral hydrate (3:1270) with 2 moles anisole (1:7445) in AcOH/H₂SO₄ (201) gives (yields: 94% (162), 90% (201)) 1,1,1-trichloro-2,2-bis-(p-methoxyphenyl)ethane [Beil. VI-1007, VI₁-(491)], m.p. 94° (162), 92° (201), 89° (209), 78° (153). — Note that neither trichloroacetaldehyde p-methoxyphenylhemiacetal nor trichloroacetaldehyde di-(p-methoxyphenyl)acetal is reported.]

With phenyl ethyl ether (phenetole). [\bar{C} with 2 moles phenetole (1:7485) + conc. H₂SO₄ or AlCl₃ (153) (162) or chloral hydrate (3:1270) with 2 moles phenetole (1:7485) in AcOH/H₂SO₄ (209) gives (91% yield (162)) 1,1,1-trichloro-2,2-bis-(p-ethoxyphenyl)-ethane [Beil. VI-1007, VI₁-(491)], m.p. 105.3° (162), 105° (209). — Note that neither trichloroacetaldehyde p-ethoxyphenylhemiacetal nor trichloroacetaldehyde di-(p-ethoxyphenyl)acetal is reported.]

With ethers of other monohydric phenols. [For analogous prepn. of other 1,1,1-trichloro-2,2-di(alkoxyaryl)ethanes from \bar{C} with p-cresol methyl ether (1:7495) (162), p-cresol ethyl ether (1:7535) (162), ethyl α -naphthyl ether (1:7635) (201), and ethyl β -naphthyl ether (1:7135) (201) see indic. refs.]

With Ethers of Dihydric Phenols

With pyrocatechol dimethyl ether (veratrole). [For behavior of chloral hydrate (3:1270) with veratrole (1:7560) + conc. H₂SO₄ yielding (210) 1,1,1-trichloro-2,2-bis-(3,4-dimethoxyphenyl)ethane [Beil. VI-1172], m.p. 116-119° (211), see indic. refs.]

With hydroquinone dimethyl ether. [Č with hydroquinone dimethyl ether (1:7160) in AcOH/H₂SO₄ gives (212) 1,1,1-trichloro-2,2-bis-(2,5-dimethoxyphenyl)ethane [Beil. VI-1172], m.p. 123° (212).]

BEHAVIOR OF C WITH ALDEHYDES

With Formaldehyde

[Chloral hydrate (3:1270) (2 parts) with 40% aq. formaldehyde (formalin) (1:0145) (1 part) + conc. H₂SO₄ as directed (213) gives both 2,4-bis-(trichloromethyl)-1,3,5-trioxane ("hexachlorodimethyltrioxin") [Beil. XIX-384], m.p. 129°, and 2,6-bis-(trichloromethyl)-tetramethylenetetroxide-1,3,5,7 ("hexachlorodimethyltetroxan") [Beil. XIX-434], m.p. 189°.]

BEHAVIOR WITH KETONES

[C with acetone (1:5400) in AcOH in s.t. at 100-150° for 15 hrs. (398) (399) cf. (400) (401) gives by addition the corresp. carbinol, viz., trichloromethyl-acetonyl-carbinol ("chloralacetone") [Beil. I-831, I₂-(872)], cryst. from lgr., m.p. 75-76° (398) (399) (401) (corresp. oxime, m.p. 104-106° (399), 95-105° (402)).]

[C with methyl phenyl ketone (acetophenone) (1:5515) in AcOH refluxed 20 hrs. (398) (402) or at 135° (399) gives (45% yield (400)) by addition the corresp. carbinol, viz., trichloromethyl-phenacyl-carbinol ("chloralacetophenone") [Beil. VIII-116], m.p. 76-77° (398), 76° (399), 68-70° (400) (corresp. oxime, m.p. 135-137° (402), 131-132° (399)).]

[For behavior of chloral hydrate (3:1270) with acetophenone (1:5515) or benzophenone (1:5150) in pres. of AlCl₃ see (153).]

BEHAVIOR WITH KETENES

[For reaction of C with diphenylketene in s.t. at 130° for 12 hrs. see (214).]

BEHAVIOR WITH ORGANIC ACIDS

With Acids Containing No Other Functional Group

[For behavior of \bar{C} with AcOH in pres. of AlCl₃ see (153); with Hg(OAc)₂ + ethylene in alc. soln. giving a prod. possibly having the structure CCl₃.CH(OC₂H₅) (OCH₂CH₂-HgOAc) see (215).]

[Note that \tilde{C} is able to add to its carbonyl group a reactive H atom derived from certain acids [e.g., \tilde{C} with malonic acid (1:0480) in AcOH at 100° for 40 hrs. (216) cf. (217), or in pyridine at 100° for 2 hrs. (67.5% yield (218)) cf. (219), or chloral hydrate (3:1270) + malonic acid (1:0480) + pyridine at 100° (220) gives (note loss of CO_2) γ,γ,γ -trichloro- β -hydroxy-n-butyric acid [Beil. III-310, III₁-(117), III₂-(221)], m.p. 118-119° (217) (218), 118.5° (216) (note hydrate, m.p. 52-54° (218)); note also that by further elimination of H₂O (e.g., with Ac₂O + NaOAc (217)) this prod. yields γ,γ,γ -trichlorocrotonic acid [Beil. II-418, II₁-(190), II₂-(397)], m.p. 113-114° (217).]

[Similarly, \bar{C} adds one of the α H atoms from succinic acid (1:0530): e.g., \bar{C} with disodium succinate + Ac₂O yields an intangible intermediate which suffers two types of further change, on one hand losing H₂O to give trichloromethylparaconic acid (β -carboxy- γ -trichloromethyl- γ -butyrolactone) [Beil. XVIII-372], and on the other suffering hydrolysis of its —CCl₃ group to give isocitric acid (α -hydroxypropane- α , β , γ -tricarboxylic acid) [Beil. III-555, III₂-(359)]; for details of execution of these reactions see (221).]

With a-Hydroxy Acids

Condensation of \bar{C} (or its hydrate) with acids containing an α -hydroxy group leads to the formation of products generically designated as "chloralides"; these are ether-esters comprising position-5 substitution products of the true parent 2-(trichloromethyl)-1,3-dioxolanone-4 (from α -hydroxyacetic acid) and are not to be confused with the specific compound "chloralide" (3:3510) obtd. from \bar{C} with H₂SO₄. With true chloralides above the initial parent, two geometrically isomeric forms are possible.

With α -hydroxyacetic acid. [\bar{C} with glycolic acid (1:0430) in s.t. at 120–130° for 2 days gives (224) 2-(trichloromethyl)-1,3-dioxolanone-4 ("glycolic acid chloralide") [Beil. XIX-103], m.p. 41–42°.]

With lactic acid. [\overline{C} with anhydrous lactic acid (1:0400) in s.t. at 150-160° (225) (224) or better chloral hydrate (3:1270) with lactic acid (1:0400) + conc. H₂SO₄ (226) (227) (228) (229) gives 2-(trichloromethyl)-5-methyl-1,3-dioxolanone-4 ("lactic acid chloralide") [Beil. XIX-105], m.p. 45° (226) (227), b.p. 222-224° (224) (225), 218-220° at 714 mm. (226); note, however, that two geom. isomers, cis, m.p. 56°, and trans, b.p. 210-212°, are claimed (229).]

With malic acid. [\bar{C} with l-malic acid (1:0450) at 120-130° for 20 hrs. (224), or chloral hydrate (3:1270) with l-malic acid (1:0450) + conc. H_2SO_4 (230) (228), gives 2-(trichloromethyl)-5-(carboxymethyl)-1,3-dioxolanone-4 ("1-malic acid chloralide"), m.p. 141° (230), 139-140° (224) (228): note, however, that chloral hydrate (3:1270) + d,l-malic acid + conc. H_2SO_4 at room temperature overnight gives (59% yield (231)), m.p. 180-181°.]

With citric acid. [Chloral hydrate (3:1270) with citric acid (1:0455) + conc. H_2SO_4 gives (228) (231) 2-(trichloromethyl)-5,5-bis-(carboxymethyl)1,3-dioxolanone-4 ($C_8H_8O_7$ - Cl_8), m.p. 164° (231), 161° (228).]

With mandelic acid. [\bar{C} with d,l-mandelic acid (1:0465) at 120° (224) cf. (227), or chloral hydrate (3:1270) with d,l-mandelic acid (1:0465) + conc. H₂SO₄ (228) (231), gives 2-(trichloromethyl)-5-phenyl-1,3-dioxolanone-4 [Beil. XIX-129], m.p. 82-83° (224)

(228), 70-71° (231), 59-60° (227); note that this disagreement of m.p.'s may be due to mixtures of possible cis-trans stereoisomers.]

With benzilic acid. [\bar{C} with benzilic acid (1:0770) in s.t. at 160-165° for 5 hrs. gives (231) 2-(trichloromethyl)-5,5-diphenyl-1,3-dioxolanone-4 ("benzilic acid chloralide"), m.p. 70°. Note that an analogous prod. has been reported (232) from chloral hydrate (3:1270) with thiobenzilic acid, (C_6H_6)₂C(SH)COOH in AcOH + HCl gas.]

With tartaric acid. [Since this acid is twice an α -hydroxy acid it reacts with 2 moles of \bar{C} forming a dichloralide of compn. $C_8H_4O_6Cl_6$: e.g., \bar{C} with d-tartaric acid (1:0525) at 150° (224), or chloral hydrate (3:1270) with d-tartaric acid (1:0525) (227) (228) (230) (231) or d,l-tartaric acid (1:0550) (227) (228) gives "tartaric acid dichloralide" [Beil. XIX-449], m.p. 213-215° (229); 164-166° (227), 161-162° (231), 161° (229), 160° (228), 159-161° (227); 128-130° (228), 122-124° (224), 116-118° (227). Note that this product should exist in three stereoisomeric forms (230), and the three groups of m.p.'s above given may represent this expectation.]

With mucic acid. This acid combines with 3 moles of chloral hydrate to give a prod. commonly called a "trichloralide"; note, however, that it is undoubtedly a dichloralide which has further condensed at its two free OH groups with a third molecule of chloral [e.g., chloral hydrate (3:1270) with mucic acid (1:0845) + H₂SO₄ gives (228) (229) a "trichloralide," m.p. 200-201° (228), 198° (229), 174-175° (229); doubtless these represent at least two stereoisomeric forms].

With Phenolic Acids (or Their Ethers)

In condensation of \bar{C} (or its hydrate) with phenolic acids, the latter behave like carboxy-substituted phenols; two series of products result according to whether *one* or *two* moles of carboxy-phenol are involved per mole of chloral. To assist in recognizing this analogy, the several products are here named as substituted carbinols or ethanes just as was done above in the behavior of \bar{C} with phenols (q.v.). Since the methyl ethers of these phenolic acids in general behave similarly, they are associated below with the corresponding phenolic acids.

With o-phenolic acids. With o-hydroxybenzoic acid. [Chloral hydrate (3:1270) with salicylic acid (1:0780) + conc. H₂SO₄ gives (233) cf. (234) some 1,1,1-trichloromethyl-(4-hydroxy-3-carboxyphenyl)-carbinol, m.p. 180–182° (233), but main prod. is 1,1,1-trichloro-2,2-bis-(4-hydroxy-3-carboxyphenyl)ethane, m.p. 290–292° (corresp. diacetate, m.p. 207–209° (233)).]

With o-methoxybenzoic acid. [Chloral hydrate (3:1270) with o-methoxybenzoic acid (1:0685) + conc. H₂SO₄ gives (yields: 45% (234), 25% (235)) 1,1,1-trichloro-(4-methoxy-3-carboxyphenyl)-carbinol, m.p. 224° (234), 216° (235), some sulfonation also occurring (235).]

With 2-hydroxy-3-methylbenzoic acid. [Chloral hydrate (3:1270) with o-cresotic acid [Beil. X-220, X_1 -(96)] + conc. H_2 SO₄ gives (236) 1,1,1-trichloro-2,2-bis-(4-hydroxy-3-methyl-5-carboxyphenyl)ethane, m.p. $283-285^{\circ}$ (236): note that the corresp. carbinol to be expected from chloral hydrate + 1 mole o-cresotic acid is unreported.]

With 2-hydroxy-4-methylbenzoic acid. [Chloral hydrate (3:1270) with m-cresotic acid [Beil. X-233, X₁-(100)] is complex and disputed; for discussion see (236) (237) (238) (239). — For behavior of $\ddot{\mathbf{C}}$ with 2-methoxy-4-methylbenzoic acid see also (241).

With 2-hydroxy-5-methylbenzoic acid. [Chloral hydrate (3:1270) with p-cresotic acid [Beil. X-227, X_1 -(98)] + conc. H_2SO_4 gives (236) a prod. of compn. $C_{12}H_8O_4Cl_6$ (2,4-bis-(trichloromethyl)-6-methyl-1,3-benzdioxin-8-carboxylic acid), m.p. 285-286° dec., derived from 2 moles chloral hydrate + 1 mole p-cresotic acid.]

With 2-hydroxy-3-naphthoic acid. [For behavior of chloral hydrate (3:1270) with 2-hydroxy-3-naphthoic acid (1:0850) + conc. H_2SO_4 see (242).]

With m-phenolic acids (or their ethers). Condensation of $\bar{\mathbf{C}}$ or its hydrate with m-phenolic acids leads generally to substituted phthalides.

With m-hydroxybenzoic acid. [Chloral hydrate (3:1270) with m-hydroxybenzoic acid (1:0825) + conc. H₂SO₄ gives (243) (244) 3-(trichloromethyl)-6-hydroxyphthalide [Beil. XVIII-20], m.p. 199-200° (244), 197-198° (243). — Note that chloral hydrate (3:1270) with ethyl m-methoxybenzoate (1:4131) + conc. H₂SO₄ gives (243) (245) 3-(trichloromethyl)-6-methoxyphthalide [Beil. XVIII-20], m.p. 135° (243) (245), which by alk. hydrol. of the —CCl₃ group gives (243) (245) 6-methoxyphthalide-3-carboxylic acid [Beil. XVIII-525], m.p. 170° (245), 169-170° (243).]

With 2-chloro-3-hydroxybenzoic acid. [Chloral hydrate (3:1270) with 2-chloro-3-hydroxybenzoic acid (3:4395) + conc. H₂SO₄ gives (246) 3-(trichloromethyl)-7-chloro-6-hydroxyphthalide, m.p. 195.5-196°.]

With 4-methyl-3-hydroxybenzoic acid. [Chloral hydrate (3:1270) with 4-methyl-3-hydroxybenzoic acid [Beil. X-237] + conc. H₂SO₄ gives (247) 3-(trichloromethyl)-5-methyl-6-hydroxyphthalide, m.p. 232° (247). — Similarly, chloral hydrate (3:1270) with 4-methyl-3-methoxybenzoic acid + conc. H₂SO₄ gives (247) 3-(trichloromethyl)-5-methyl-6-methoxyphthalide, m.p. 132° (247).]

With 3,4,5-trihydroxybenzoic acid. [Chloral hydrate (3:1270) with gallic acid (1:0875) + conc. H₂SO₄ gives (236) according to conditions three different products: with excess of gallic acid prod. is 3-(trichloromethyl)-4,5,6-trihydroxyphthalide, m.p. 210-212° (236), for further reactions of which see (236) (248); with excess chloral, however, the reaction gives two other materials (236). — Note that chloral hydrate (3:1270) with 3,4,5-trimethoxybenzoic acid (gallic acid trimethyl ether) [Beil. X-481, X₁-(240)] + conc. H₂SO₄ (249) (250) (251), or with methyl 3,4,5-trimethoxybenzoate (methyl gallate trimethyl) ether) [Beil. X-484, X₁-(242)] (252), gives (56% yield (249)) 3-(trichloromethyl)-4,5,6-trimethoxyphthalide [Beil. XVIII₁-(389)], m.p. 76-77° (249), 71-72° (250), 70-71° (252) (note also that during condensation some demethylation may occur (253), avoided by (251)); this prod. by hydrolysis of the trichloromethyl group yields 4,5,6-trimethoxyphthalide-3-carboxylic acid [Beil. XVIII₁-(544)], m.p. 147-149° (249), 147-148° (250), 147° (251), 146-149° (254), 142-143° (252).]

With p-phenolic acids (or their ethers). With p-hydroxybenzoic acid. [Chloral hydrate (3:1270) (3 moles) with p-hydroxybenzoic acid (1:0840) (1 mole) + conc. H₂SO₄ at room temp. for 3 days condenses giving (31% yield on the acid (255)) 2,4-bis-(trichloromethyl)benzodioxin-1,3-carboxylic acid-6, m.p. 225.5-226.5° (255); for further related reactions of this prod. see (256); for further generally similar work in benzodioxin series see (257) (258); note that neither the substituted carbinol nor the substituted ethane corresp. to the behavior of o-hydroxybenzoic acid (see above) under similar conditions is reported.]

With p-methoxybenzoic acid. [Chloral hydrate (3:1270) with p-anisic acid (1:0805) + conc. H₂SO₄ reacts in a 1:1 ratio (note difference from 2:1 ratio in preceding paragraph) giving (259) cf. (235) trichloromethyl-(2-methoxy-5-carboxyphenyl)-carbinol, m.p. 198-199° (259); note that the earlier product (235) was impure.]

With 4-hydroxy-3,5-dimethoxybenzoic acid. [Chloral hydrate (3:1270) with syringic acid (1:0830) + conc. H₂SO₄ gives (86% yield (253)) 3-(trichloromethyl)-5-hydroxy-4,6-dimethoxyphthalide, m.p. 172-173° (253).]

With keto acids (see also below under behavior with esters of organic acids).

With levulinic acid. [\ddot{C} (1 mole) with β -acetopropionic acid (levulinic acid) (1:0405)

in pres. of NaOAc refluxed 4 hrs. gives (30% yield (271)) α -(trichloroethylidene)- β -aceto-propionic acid, m.p. 113.5° (271).]

BEHAVIOR WITH ESTERS OF ORGANIC ACIDS

[Note that \bar{C} does not (170) react with orthoformates (difference from chloral hydrate (3:1270) q.v. — Note that \bar{C} with esters of α -ketoacids on htg. gives (260) 5-substituted-2-(trichloro)-1,3-dioxolanone-4's, such esters reacting in their enolic forms as esters of α -hydroxy unsaturated acids; for such products from ethyl acetopyruvate [Beil. III-747, III₁-(261), III₂-(465)] (261) or from ethyl benzoylpyruvate [Beil. X-815, X₁-(395)] see (260). — \bar{C} with ethyl acetoacetate (1:1710) in pyridine at 25–30° for 5 days gives (262) by addn. the corresp. carbinol, viz., ethyl α -(2,2,2-trichloro-1-hydroxyethyl)acetoacetate.]

BEHAVIOR WITH ACID CHLORIDES

(See also behavior with anhydrides below.)

[\ddot{C} with acetyl chloride (3:7065) (263) (264) in pres. of conc. H₂SO₄ (265), or chloral hydrate (3:1270) with acetyl chloride (3:7065) (263) gives α,β,β,β -tetrachloroethyl acetate ("chloral-acetyl chloride"), b.p. 193° (264), 185° (263).]

[For analogous behavior of \bar{C} with propionyl chloride (3:7170) (265), with *n*-butyryl chloride (3:7370) (265), with acetyl bromide (266), or with acetyl iodide (266) see indic. refs.]

[For behavior of \bar{C} with carbonyl chloride (3:5000) in pres. of tertiary amines (except pyridine) giving α,β,β,β -tetrachloroethyl chloroformate [Beil. III-12] or bis-(α,β,β,β -tetrachloroethyl)carbonate [Beil. III-8] see (267).]

BEHAVIOR WITH ACID ANHYDRIDES

[\bar{C} with acetic anhydride (1:1015) at 150° (263) or in pres. of H_2SO_4 at 5° (268) or chloral hydrate (3:1270) with Ac_2O (1:1015) + H_2SO_4 (269) gives trichloroethylidene diacetate, $CCl_3.CH(OAc)_2$ [Beil. II-153, II₁-(71), II₂-(167)], b.p. 221-222° (263), 221° at 751 mm. (269), 111-113° at 10 mm. (268): for study of pyrolysis of this prod. see (270).]

Behavior involving Condensation of C with Reactive C-H of various Organic Compounds

(See also above under acids.)

With various alkylated pyridines. With 2-methylpyridine. [\bar{C} with 2-methylpyridine (α-picoline) [Beil. XX-234, XX₁-(82)] in iso-AmOAc refluxed 10-12 hrs. (272) (273) (274) (275) (276) (277) (278), or without solvent at 100° for 10 hrs. (279) or 112° for 36-40 hrs. (280), gives (yields: 67% (280), 47% (278), 40-47% (276)) trichloromethyl-α-picolyl-carbinol = 1-(trichloromethyl)-2-(α-picolyl)ethanol [Beil. XXI-46], m.p. 86-87° (272) (273) (279), 86° (278), 85-86° (280), 82° (277) (corresp. B.HCl, m.p. 201-202° (272), 199-200° (274); corresp. B.PkOH, m.p. 167° (274)). — For studies on dehydrative hydrolysis of this prod. to β-(α-pyridyl)acrylic acid [Beil. XXII-55], m.p. 202-203° (272), 200° dec. (274) (corresp. hydrochloride, m.p. 220° dec. (273)), see (280) (275) (273) (274) (272); for studies on its reduction see (281) (275) (274).]

With 4-methylpyridine. [C with 4-methylpyridine (γ -picoline) [Beil. XX-240, XX₁-(85)] at 100° for 15 hrs. (282), or in pres. of ZnCl₂ in s.t. at 85-90° (283) (284) or at 34° for 24 hrs. then at 100° for 2 hrs. (285) (286), gives (yields: 42% (286), 16-18% (285), 8-9% (284)) trichloromethyl- γ -picolyl-carbinol = 1-(trichloromethyl)-2-(γ -picolyl)-ethanol [Beil. XXI-57, XXI₁-(204)], m.p. 168° cor. (286), 166-167° cor. (285), 166° cor. (283), 160° (282). — For studies on dehydrative hydrolysis (yields: 73% (285), 70% (283))

of this prod. to β -(γ -pyridyl)acrylic acid [Beil. XXII₁-(505)], m.p. 296° cor. dec. (283), 293–295° cor. (285), see indic. refs.]

With other alkylated pyridines. [For corresp. condensations of \bar{C} with 3-ethyl-4-methylpyridine (" β -collidine") [Beil. XX-250, XX₁-(87)] (287) (288), with 5-ethyl-2-methylpyridine [Beil. XX-248, XX₁-(86)] (290), with 2,4,6-trimethylpyridine ("collidine") [Beil. XX-250, XX₁-(87)] (289) (291) see indic. refs.]

With various alkylated quinolines. [For corresp. condensations of \bar{C} with 2-methyl-quinoline (quinaldine) [Beil. XX-387, XX₁-(148)] (285) (292) (293) (294) (295), or with 4-methylquinoline ("lepidine") [Beil. XX-395, XX₁-(150)] (296) (297) (295), see indic. refs.]

With nitroparaffins. C in aq. mildly alk. soln. also adds 1 reactive hydrogen atom from nitroalkanes yielding the corresp. substituted alcohols.

With nitromethane. [Chloral hydrate (3:1270) (1 mole) with nitromethane (1 mole) in aq. Na₂SO₃ at 70° gives (100% yield (298)) the corresp. carbinol, viz., 1,1,1-trichloro-3-nitropropanol-2 [Beil. I-366], m.p. 48-49° (299), 45-46° (298), 42-43° (300); b.p. 119° at 3 mm. (298) (corresp. acetate, m.p. 61-62°, b.p. 160° at 25 mm., 148° at 16 mm. (298)); note that other mildly alk. salts such as K₂CO₃ (298) (300), NaOAc (298), or Na₂B₄O₇ (298) may be used although Na₂SO₃ is best (298); note also that this prod. does not (298) react further with chloral. — For studies of the behavior of this prod. or its esters with diazonium salts (299) (301), with various amines (302) (303), or reducing agents (304) see indic. refs.]

With nitroethane. [Chloral hydrate (3:1270) with nitroethane in aq. Na₂SO₃ + K₂CO₃ gives (80% yield (305)) the corresp. carbinol, viz., 1,1,1-truchloro-3-nitrobutanol-2, oil, b.p. 115° at 2 mm. (corresp. acetate, b.p. 125° at 2 mm., 98° at 0.05 mm. (305)).]

With phenyl-nitromethane. [Chloral hydrate (3:1270) with phenyl-nitromethane in aq. K₂CO₃ at 80° gives (305) 1,1,1-trichloro-3-phenyl-3-nitropropanol-2, m.p. 109° (corresp. acetate, m.p. 98° (305)).]

BEHAVIOR WITH GRIGNARD REAGENTS

Č with RMgX reagents may react in either or both of two modes: on the one hand normal addition may occur leading to the corresp. carbinols; on the other, reduction at the expense of the RMgX cpd. may occur leading to formn. of 2,2,2-trichloroethanol-1 (3:5775). Of these two types the former occurs when the RMgX cpd. is not easily dehydrogenated.

With aliphatic RMgX compounds. With MeMgX. [C with MeMgBr (306) (307) cf. (308) or MeMgI (307) (166) cf. (308) in ether gives (yields: 40% (306) (307)) 1,1,1-trichloropropanol-2 (3:0846); note, however, that yield is profoundly influenced by press of certain metal salts (306), that some reduction of C to 2,2,2-trichloroethanol-1 (3:5775) probably occurs, and that this latter is favored by use of EtOMgBr, etc. (see 3:5775).]

With EtMgX. [C with EtMgBr (309) (310) (311) or with EtMgI (166) gives both addition and reduction leading respectively to 1,1,1-trichlorobutanol-2 (3:5955) q.v. and 2,2,2-trichloroethanol-1 (3:5775) q.v.]

With n-PrMgX. [\bar{C} with n-PrMgBr in ether gives (21-23% yield (310)) the carbinol from addition, viz., 1,1,1-trichloropentanol-2 [Beil. I₂-419], b.p. 115° at 686 mm. (310), $D_{20}^{20} = 1.481$ (310) (corresp. acetate, b.p. 168-169° at 686 mm., corresp. benzoate, b.p. 197-198° at 686 mm. (310)) but whether the material still unaccounted for represents 2,2,2-trichloroethanol (3:5775) from reduction of \bar{C} has not been reported.]

With iso-PrMgX. [C with iso-PrMgBr in ether gives (31-33% yield (312)) the carbinol from addition, viz., 1,1,1-trichloro-3-methylbutanol-2 [Beil. I-392, I₂-(425)], b.p. 105° at

674 mm., $D_{20}^{20} = 1.402$ (312) (corresp. acetate, b.p. 156-157° at 685 mm.; corresp. benzoate b.p. 180-181° at 685 mm. (312)), but whether the material still unaccounted for represents 2,2,2-trichloroethanol-1 (3:5775) from reduction of $\bar{\mathbf{C}}$ has not been reported.]

With n-BuMgX. [\bar{C} with n-BuMgBr in ether gives (34-36% yield (312)) the carbinol from addition, viz., 1,1,1-trichlorohexanol-2 [Beil. I₂-(438)], b.p. 108° at 673 mm., $D_{20}=1.327$ (312) (corresp. acetate, b.p. 157-158° at 684 mm.; corresp. benzoate, b.p. 182-183° at 684 mm. (312)), but whether the material still unaccounted for represents 2,2,2-trichloroethanol-1 (3:5775) from reduction of \bar{C} has never been reported.]

With higher alkyl MgX cpds. [Č with n-AmMgBr (313) or with n-HexMgBr (313) in ether gives (yields respectively 50-61% and 56-69%) the reduction product, 2,2,2-tri-chloroethanol-1 (3:5775); the corresponding carbinols to be expected by addition are unreported.]

With aromatic RMgX compounds. With C_6H_5MgX . [\bar{C} with C_6H_5MgBr in ether gives (70% yield (314)) (315) the expected truchloromethyl-phenyl-carbinol [Beil. VI-476, VI₁-(237)], m.p. 37° (155), b.p. 145° at 15 mm. (155) (corresp. acetate, m.p. 87.5° (155); corresp. benzoate, m.p. 97.5° (155); corresp. p-nitrobenzoate, m.p. 109° (156)).]

With alkaryl MgX compounds. With $C_6H_5CH_2MgX$ cpds. [C with $C_6H_5CH_2MgCl$ (309) (310) or $C_6H_5CH_2MgBr$ (166) gives both addition (309) (310) (166) and reduction (309) yielding from the former trichloromethyl-benzyl-carbinol, b.p. 158-160° at 18 mm. (166) (corresp. acetate, m.p. 110-111° (166), 109-110° (309)), together with a very small amount (309) of 2,2,2-trichloroethanol-1 (3:5775).]

With cyclohexyl MgX cpds. [\bar{C} with cyclohexyl MgBr (314) (316) in ether is claimed to give (30% yield (316)) trichloromethyl-cyclohexyl-carbinol, b.p. 119-121° at 15 mm., $D_{20}^{20} = 1.2839$, $n_{20}^{25} = 1.4820$ (corresp. acetate, b.p. 173° at 680 mm.; corresp. benzoate, b.p. 210° at 683.3 mm.), and also (42% yield (314)) 2,2,2-trichloroethanol-1 (3:5775).]

With various other cases. [For behavior of \tilde{C} with the RMgX cpds. from β -phenylethyl bromide, γ -phenylpropyl bromide, and δ -phenylbutyl bromide where the reaction appears to be mainly reduction of \tilde{C} see (317).]

BEHAVIOR WITH HCN (OR ITS SALTS)

Behavior with HCN. [\bar{C} with strong aq. HCN refluxed several days (318) or chloral hydrate (3:1270) with aq. 10-12% HCN (319) (320) or with aq. 15% HCN in s.t. at 100° for 4 hrs. (321) cf. (322) gives (71% yield (321)) β,β,β -trichloro- α -hydroxypropionitrile = trichlorolactonitrile = chloral cyanohydrin [Beil. III-288, III₁-(111), III₂-(210)], m.p. 60-61° (318), 58-61° (321) (corresp. benzoate, m.p. 40-41° (323)); this prod. upon partial hydrolysis in AcOH/H₂SO₄ gives (324) trichlorolactamide [Beil. III-288, III₁-(111), III₂-(210)], m.p. 95-96° (324), or on complete hydrolysis with conc. HCl (321) (318) (320) gives trichlorolactic acid [Beil. III-286, III₁-(111), III₂-(210)], very sol. aq., but cryst. from ether, m.p. 118-119° (321).]

Behavior with KCN. [C with MeOH/KCN gives within 1 min. (84% yield (131)) methyl dichloroacetate (3:5655); C with EtOH/KCN similarly gives (88% yield (131)) ethyl dichloroacetate (3:5850); C with n-propyl alc./KCN similarly gives (70% yield (131)) n-propyl dichloroacetate (3:6000); for extensive discussion of this reaction see (131) (325) (329).]

[For discussion of behavior of chloral hydrate (3:1270) with KCN in C₆H₆ see (326): note that chloral hydrate (3:1270) with NaCN + CaCO₃ as directed (328) is an important method of prepn. (88-92% yield) of dichloroacetic acid (3:6208) q.v.: note also that chloral hydrate (3:1270) + NH₄OH + KCN in ether as directed (329) gives (65-78% yield) dichloroacetamide (see under the acid (3:6208).]

BEHAVIOR WITH DIAZOMETHANE

[Č (309) (330) (331) or chloral hydrate (3:1270) (332) gives (yields: 64% (330), 48% (309), 47.5% (332)) 3,3,3-trichloro-1,2-epoxypropane (3:5760) q.v.]

BEHAVIOR WITH AMINES

With primary aromatic amines. With aniline. [\bar{C} with aniline (333) (334), or chloral hydrate (3:1270) with aniline in aq. (334), gives 1,1,1-trichloro-2,2-dianilinoethane (θ,θ,β -trichloroethylidene)di-aniline [Beil. XII-187, XII₁-(168)], pr. from ether/alc., m.p. 107-108° (335), 107.5° (334), 100-101° (333). — Note that the addition product to be expected from 1 mole \bar{C} with 1 mole aniline has not itself been isolated (except as a molecular compound with chloral hydrate (336)) since it appears to react immediately with a second mole of aniline to give the above-indicated prod.]

With aniline + hydroxylamine. [Chloral hydrate (3:1270) (1 mole) with aniline (1 mole) + NH₂OH.HCl (3 moles) + HCl + Na₂SO₄ in aq. soln. as directed gives (80-91%) yield (337) cf. (338) (339) isonitrosoacetanilide [Beil. XII₁-(275)], m p. 175° dec. (337) (338) (339). — Note that this product with conc. H₂SO₄ (337) (340) gives (71-78%) yield (337)) indigo; for extension of the method to use of other amines (and ultimately substituted indigos) see (338) (341) (345).]

With other primary aromatic amines. The condensation of \bar{C} or of chloral hydrate (3:1270) with many other primary aromatic amines and diamines has been studied but cannot be detailed here [for extensive review and discussion see (336) (334) (335) (342) (343) (344) (403)].

With secondary aromatic amines. With N-alkylanilines. [Chloral hydrate (3:1270) with N-methylaniline on warming gives (346) trichloromethyl-(p-methylaminophenyl)-carbinol [Beil. XIII-628], m.p. 112° dec.; sımılarly, chloral hydrate (3:1270) with N-ethylaniline on warming gives (346) trichloromethyl-(p-ethylaminophenyl)-carbinol [Beil. XIII-628], m.p. 98°.]

With N-alkyl-o-toluidines. [Chloral hydrate (3:1270) with N-methyl-o-toluidine + ZnCl₂ gives (347) trichloromethyl-(4-methylamino-3-methylphenyl)-carbinol, m.p. 104-105°; similarly, chloral hydrate (3:1270) with N-ethyl-o-toluidine + ZnCl₂ gives (349) trichloromethyl-(4-ethylamino-3-methylphenyl)-carbinol, m.p. 107° (for studies of nitration (348) and bromination (349) of these two products see indic. refs.).]

With tertiary aromatic amines. With N,N-dralkylanthnes. [C with N,N-dimethylaniline in phenol at room temp. (350) or chloral hydrate with N,N-dimethylaniline + ZnCl₂ on stdg. (351) (352) gives trichloromethyl-(p-dimethylaminophenyl)-carbinol [Beil. XIII-628], m.p. 111° dec. (352) (corresp. carbinyl acetate, m.p. 84-85° (352)) (for study of nitration of this prod. see (348)).]

BEHAVIOR WITH ARYLHYDRAZINES

With phenylhydrazine. [Č with phenylhydrazine or chloral hydrate (3:1270) with aq. phenylhydrazine salts reacts (353) vigorously, but the products formed have not been unambiguously characterized (see also below).]

With p-nitrophenylhydrazine. [Chloral hydrate (3:1270) (large excess) with p-nitrophenylhydrazine in AcOH at 100° for 10 min. undergoes a series of reactions resulting (354) in a chlorine-free prod., m.p. 228°, regarded (354) as 1-(p-nitrophenyl)-3,5-dihydroxy-pyrazolone-4-(p-nitrophenylhydrazone).]

With 2,4-dinitrophenylhydrazine. [Chloral hydrate (3:1270) with 2,4-dinitrophenylhydrazine gives according to conditions either or both (355) glyoxylic acid p-nitrophenyl-

hydrazone, dihydrate from aq., m.p. 191° (355); anhydrous, m.p. 194-195° (355), 190° (356), or chloroglyoxal bis-(2,4-dinitrophenylhydrazone), m.p. 278° (355).]

With various halogenated hydrazines. Owing to the violence with which the product initially formed decomposes, the behavior of \tilde{C} with phenylhydrazine (see also above) has been little studied. With halogenated phenylhydrazines the decomposition is more moderate and has been extensively examined. The nature of the products has been found to depend mainly upon the solvent medium: thus in alcohols the principal product is the corresponding substituted phenylhydrazone of the appropriate alkyl glyoxylate; in water or AcOH, however, loss of both H_2O and HCl occurs leading to formation of the corresponding α,α -dichloro- β -arylazoethylenes.

[Chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine in ethyl alc. at 60° gives (100% yield (357)) ethyl glyoxylate 2,4-dichlorophenylhydrazone, yellow pr., m.p. 121.5°; note that other alcs. (357) give corresp. esters. — However, chloral hydrate (1 mole) (3:1270) with 2,4-dichlorophenylhydrazine (1 mole) in AcOH at 80° (or in presence of NaOAc at 60°) gives (357) α,α -dichloro- β -(2,4-dichlorobenzeneazo)ethylene, red pr. from alc., m.p. 84.5°.]

[For completely analogous behavior of chloral hydrate (3:1270) with other halogenated phenylhydrazines, such as 2,5-dichlorophenylhydrazine (358), 2,4,5-trichlorophenylhydrazine (358), 2,4,6-tribromophenylhydrazine (359), 3-bromo-4-methylphenylhydrazine (360), or 3,5-dibromo-4-methylphenylhydrazine (360), see indic. refs. — Note that a generally analogous behavior toward halogenated arylhydrazines is shown by butyrchloral (3:5910) q.v. and by tribromoacetaldehyde (bromal).]

BEHAVIOR WITH AMIDES

Č with compounds of the amide type readily undergoes an addition reaction leading to products of the general form CCl₃.CH(OH).NH.CO.R.

With Aliphatic Monamides

With formamide. [\bar{C} (1 mole) with formamide (1 mole) on stdg. gives (361) (362) an addition prod., chloralformamide, CCl₃.CH(OH).NH.CHO [Beil. II-27, II₁-(21), II₂-(37)], m.p. 124–126° (363), 118° (362), 115–116° (361); note that this product has in the literature often been confused with the isomeric β,β,β -trichloroethyl carbamate, CCl₃-CH₂O.CO.NH₂ ("Voluntal") [see also under β,β,β -trichloroethyl alcohol (3:5775)]. Note also that chloralformamide with aq. NaOH + Ac₂O (362) or with aq. NaOH + BzCl (364) cf. (362) undergoes bimolecular condensation with loss of H₂O giving anhydrochloralformamide [CCl₃.CH(NH.CHO)]₂O, m.p. 194.5–195° (362), 193° (364).]

With acetamide. [C (1 mole) with acetamide (1 mole) (72) (172), or chloral hydrate (3:1270) (1 mole) with acetamide (1 mole), or chloralammonia with AcCl or Ac₂O (128) gives chloralacetamide [Beil. II-179, II₁-(81)], m.p. 158-159° (362), 158° (172), 156°-157° (72), 156° (128); this prod. with aq. NaOH + Ac₂O undergoes bimolecular loss of aq. yielding (362) cf. (369) anhydrochloralacetamide, [CCl₃.CH(NH.CO.CH₃)]₂O, m.p. 212-213° (362), 207° (364). — For study of reduction of chloralacetamide see (365) (366).]

With higher monoamides. [For analogous condensation of \tilde{C} with propionamide, isobutyramide, n-valeramide, n-caproamide, n-caprylamide, and phenylacetamide together with study of reduction of the several products see (367) cf. (369).]

With Aromatic Monoamides

With benzamide. [C (1 mole) with benzamide (1 mole) (172) (362) cf. (369), or chloral hydrate (3:1270) with benzonitrile + dry HCl (368) gives chloralbenzamide [Beil. IX-

209, IX₁-(101)], m.p. 150-151° (72), 150° (362), 146° (172) (368); this product with aq. NaOH + BzCl or Ac_2O gives (362) by dehydrative bimolecular condensation anhydrochloralbenzamide, known (362) in two forms, higher-melting form, m.p. 199-200°, and lower-melting form, m.p. 137-138°. — For study of reduction of chloralbenzamide see (366) cf. (369).]

With toluamides. [For condensation of \tilde{C} with o-, m-, and p-toluamides see (370); for the behavior of the products with PCl₅ see (371).]

With salicylamide. [C with salicylamide on warming directly (372) or in CHCl₃ (373) gives chloralsalicylamide, sintering at 117° and melting about 10° higher (372); for the corresp. anhydro compound (cf. above), m.p. 174–175°, see (369); for studies of chloral-salicylamide on chlorination (374), bromination (375), or nitration (375) see indic. refs.]

With amides of various substituted salicylic acids. [For behavior of \bar{C} with the amides of 3-chlorosalicylic acid (3:4745), 5-chlorosalicylic acid (3:4705), and 3,5-dichlorosalicylic acid (3:4935) see (374) (376) (377); for behavior of \bar{C} with amides of various nitrosalicylic acids (378) or various aminosalicylic acids (379) see indic. refs.]

With o-aminobenzamide (anthranilamide). [For behavior of \tilde{C} with anthranilamide and its relatives see (380).]

With Amides of Dibasic Acids

Note that two series of products are formed.

With urea. [Chloral hydrate (3:1270) (1 mole) with urea (2 moles) in aq. soln. on stdg. 3 days at room temp. gives (66% yield (381)) (382) cf. (172) chloralurea, N-(β , β , β -trichloro- α -hydroxyethyl)urea [Beil. III-59, III₁-(27)], cryst. from MeOH/C₆H₆ (381) or EtOH/C₆H₆ 1:3 (382), m.p. 150° dec. (381) (382). — However, chloral hydrate (3:1270) (2 moles) with urea (1 mole) in aq. HCl at room temp. for 3 days gives (71% yield (381)) (382) cf. (383) dichloralurea [Beil. III-60, III₁-(27), III₂-(49)], cryst. from aq. alc., m.p. 196° (381), 194° dec. (382), 190° (172).]

With thiourea. [For behavior of C with thiourea see (383).]

With various substituted ureas. With monosubstituted ureas. [Chloral hydrate (3:1270) (2 moles) with N-methylurea (1 mole) in aq. soln. at room temp. gives (384) N-methyl-N'-(β,β,β -trichloro- α -hydroxyethyl) urea, m.p. 140° dec. (384). — Chloral hydrate (3:1270) with N-ethylurea behaves in analogous fashion (384). — Chloral hydrate (3:1270) (2)½ moles) with N-phenylurea in aq. HCl gives (84% yield (382)) N-phenyl-N'-(β,β,β -trichloro- α -hydroxyethyl)urea, m.p. 142° dec. (382). — For corresp. behavior of chloral hydrate (3:1270) with N-o-tolylurea, N-p-tolylurea, N-m-nitrophenylurea, and N-p-nitrophenylurea see (385).]

With disubstituted ureas. [Chloral hydrate (3:1270) with N,N-dimethylurea gives (384) cf. (386) N,N-dimethyl-N'-(β,β,β -trichloro- α -hydroxyethyl)urea, cryst. from aq. as monohydrate, m.p. 74° dec. (384) (386), which becomes anhydrous on stdg., cryst. from alc., m.p. 157° dec. (384), 156° (386). — For analogous behavior of \bar{C} with N,N-diethylurea giving prod., m.p. 146° dec. (384), 142° (386), see indic. refs. — \bar{C} with N,N-diphenylurea gives analogous prod., m.p. 170° dec. (384).]

With amides of other dibasic acids. [For generally analogous behavior of C with oxamide (384), malonamide (384) (369), succinamide (369), and their relatives see indic. refs.]

With Urethanes

With ethyl carbamate. [\bar{C} with ethyl carbamate ("urethane") in conc. HCl gives (387) (388) ethyl $N-(\beta,\beta,\beta-\text{trichloro-}\alpha-\text{hydroxyethyl})$ carbamate ("chloralurethane") [Beil. III-24, III₁-(12), III₂-(22)], m.p. 103° (362) (388). — This product on htg. alone or

in aq. at 100° regenerates (388) chloral and ethyl carbamate. — With AcCl under reflux it gives (80% yield (387)) the corresp. acetate, m.p. 47-49°, b.p. 165° at 15 mm. (387). — With aq. NaOH + Ac₂O (362) (387) or with aq. KOH + BzCl (364) chloralurethane undergoes dehydrative bimolecular condensation yielding anhydro-chloralurethane [Beil. III₁-12], which exists in both high-melting (161-162°) and low-melting (149-150°) forms (362).]

With other alkyl carbamates. [For generally analogous behavior of \bar{C} with methyl carbamate (362), n-propyl carbamate (389), isobutyl carbamate (389), isoamyl carbamate (362), and menthyl carbamate (362) see indic. refs.]

- Preliminary tests for Č: Owing to the length of the text of this compound, a brief summary of the tests most significant as preliminary indications is given here; for details refer back as indicated and also see chloral hydrate (3:1270).
- C reduces NH₃/AgNO₃ and Fehling's soln. but only on warming (see above under oxidn. of C̄). C̄ gives fuchsin-aldehyde test with Schiff's reagent (but chloral hydrate (3:1270) does not). C̄ with conc. H₂SO₄ readily polymerizes (see above under polymerization of C̄). C̄ with aq. or alc. alkali on warming undergoes hydrolytic cleavage to CHCl₃ (3:5050) + alkali formate (see above under behavior of C̄ with alkalies); therefore, C̄ with alc. alkali + annline gives characteristic odor of phenyl isocyanide.
- Trichloroacetaldioxime: m.p. 56° (135). [See above under behavior of $\bar{\mathbf{C}}$ with hydroxylamine.]
- Trichloroacetaldehyde phenylhydrazone: unreported. [See above under behavior of C with arylhydrazines.]
- Trichloroacetaldehyde p-nitrophenylhydrazone: unreported. [See above under behavior of C with arylhydrazines.]
- —— Trichloroacetaldehyde 2,4-dinitrophenylhydrazone: a prod. of m.p. 131° has been claimed (390) but could not be confirmed (391). [See also above under behavior of C with arythydrazines.]
- Trichloroacetaldehyde semicarbazone: unreported. [Note that chloral hydrate (3:1270) with semicarbazide in aq. (392) (394) cf. (393) or chloral ethylalcoholate (3:0860) with semicarbazide in alc. (392) gives an addn. prod., m.p. 90°, which on boilg. with aq. yields (392) glyoxylic acid semicarbazone [Beil. III-600, III₁-(209) III₂-(389)], m.p. 235-236° (392), 235-238° (393), 207° (395), 206-208° dec. (396), 202-203° (397), 202° dec. (394) (note that these results may represent two stereoisomeric forms (397)).]

3:5220 2,3-DICHLOROBUTADIENE-1,3 Cl Cl
$$C_4H_4Cl_2$$
 Beil. S.N. 12 $H_2C=C-C=CH_2$

B.P. 98° at 760 mm. (1) (2)
$$D_4^{20} = 1.1829$$
 (1) $n_D^{20} = 1.4890$ (1) $41-43^\circ$ at 85 mm. (1) $40-43^\circ$ at 85 mm. (3)

[For prepn. of \overline{C} (86% yield (1)) from 1,2,3-trichlorobutene-3 (2,3,4-trichlorobutene-1) (3:9064) with excess MeOH/KOH at 10-15° see (1) (2); for formn. (together with other products) from 1,2,3,4-tetrachlorobutane (3:1760) with MeOH/KOH at 10-18° see (1) (2); from chloroprene (3:7080) by addn. of ICl followed by treatment with alc. KOH (3),

Č polymerizes completely within 24 hrs. at room temp., in about 40 min. at 85–90°; this is about 10 times as fast as chloroprene (3:7080) and 7000 times as fast as isoprene (1:8020). The polymer is a white opaque tough hard mass, non-plastic and lacking extensibility. It is insol. in and separates from liquid Č but is partly soluble in CHCl₃ (1). The polymerization is inhibited by hydroquinone and accelerated by benzoyl peroxide (2).

C does not (1) react with maleic anhydride (1:0625) or with 1,4-naphthoguinone (1:9040).

3:5220 (1) Carothers, Berchet, J. Am. Chem. Soc. 55, 2004-2008 (1933). (2) Carothers, Berchet, U.S. 1,965,319, July 3, 1934; Cent. 1935, I 3724; C.A. 28, 5716 (1934). (3) Petrov, J. Gen. Chem. (U.S.S.R.) 13, 155-158 (1943); C.A. 38, 1466-1467 (1944).

3:5225-3:5235

3:5225 METHOXYACETYL CHLORIDE
$$C_3H_5O_2Cl$$
 Beil. S.N. 220 CH_3OCH_2 — C =O Cl

B.P. 99° (1)
$$D_4^{20} = 1.1871$$
 $n_D^{20} = 1.41945$ (2) 50-51° at 69 mm. (2)

[For prepn. of C from methoxyacetic acid (1:1065) with SOCl₂ (yields: 70% (1), 45% (2)) see indic. refs. (note that best yield is obtd. with 10% less than 1 mole SOCl₂ (1) since cleavage of the methoxy group is thus minimized); from methoxyacetic acid anhydride [Beil. III₁-(92)] with COCl₂ (3:5000) at 160° under reduced press. over CaCl₂ on pumice see (3); from chloromethyl methyl ether (3:7085) contg. 4.67% dislvd. ZnCl₂ on shaking with CO at 25-50° and 275-625 pounds press. for 8 hrs. see (4).

 $[\bar{C}]$ with alcs. + pyridine in CHCl₃ soln. gives (1) corresp. esters; for reactn. of \bar{C} with benzyl alc. (1:6480), with β -phenylethyl a c. (1:6505), citronellol, or geraniol (1:6270) see (1); with menthol (1:5940) see (5); for study of rate of reactn. of \bar{C} with benzyl alc. (1:6480), cyclohexanol (1:6415), or ethylene chlorohydrin (3:5552) in dioxane soln, see (2).]

Č on hydrolysis yields methoxyacetic acid (1:1065); for the amide, anilide, and other derivs. corresp. to C see methoxyacetic acid (1:1065).

3:5225 (1) Rothstein, Bull. soc. chim. (4) 51, 840 (1932). (2) Leimu, Ber. 70, 1044, 1050 (1937). (3) Stellmann, French 785,075, Aug. 1, 1935; Cent. 1935, II 3301. (4) Scott (to du Pont Co.). 3:5230 1,2,3-TRICHLORO-2-(CHLOROMETHYL)-C₅H₈Cl₄ Beil. S.N. 10 BUTANE

[For prepn. of C from 3-chloro-2-(chloromethyl)butene-1 (3:9206) with Cl₂ + NaHCO₃ at 0° (90% yield) see (1); for formn. from other sources see (2).]

[Č with alc. KOH gives (2) (by loss of 1 HCl) 1,3-dichloro-2-(chloromethyl)butene-1 (3:9201) and (by further loss of 1 HCl or perhaps 2 HCl from C) also 1-chloro-2-(chloromethyl)butadiene-1,3 (3:9195).]

 \bar{C} on hydrolysis with aq. $K_2CO_3 + KOH$ yields (2) an alcohol.

3:5230 (1) Tishchenko, J. Gen. Chem. (U.S.S.R.) 8, 1232-1246 (1938); Cent. 1939, II 4222; C.A. 33, 4190 (1939). (2) Tishchenko, J. Gen. Chem. (U.S.S.R.) 6, 1116-1132 (1936); Cent. 1937, I 573; C.A. 31, 1003 (1937).

B.P.
$$105.0^{\circ}$$
 at 750 mm. (1) $D_4^{20} = 1.4202$ (1); $n_D^{20} = 1.4541$ (1) $104.7-105.2^{\circ}$ (2) 1.4177 (4) 1.4535 (4) $103-106^{\circ}$ at 750 mm. (3)

[For prepn. of \tilde{C} from chloroacetic acid (3:1370) with PCl₃ (5) (40), or in HCl atm. under press. at 150° (6), or with ZnCl₂ (67% yield (7)) see indic. refs.; with P₂O₅ + HCl gas at 200° see (8); with SOCl₂ (yields: 95% (9), 55% (10), 50% (7)) (11) see indic. refs.; with benzoyl chloride (3:6240) (yield 71-76%) see (12); with oxalyl dichloride (3:5060) (80% yield) see (3); with physical properties (3:5000) over activated carbon at 200° see (13); with benzotrichloride (3:6540) + ZnCl₂ at 80-90° (80% yield) see (14); with Cl₂ + S₂Cl₂ (95% yield (15)) or Cl₂ + lower chlorides of sulfur + FeCl₃, SnCl₄, etc., at 50-60° (82% yield (16)) see indic. refs.]

[For prepn. of \tilde{C} from chloroacetic acid anhydride (3:0730) with oxalyl dichloride (3:5060) see (3); from ketene with NOCl see (17); from α,β -dichlorovinyl ethyl ether (3:5540) + HCl gas see (18); from α,β -dichloroethylene + O₂ in pres. of Br₂ or conc. H₂SO₄ see (19); from acetyl chloride (3:7065) with Cl₂ in sunlight (20) or in CCl₄ in u.v. light (21) or in pres. of I₂ (22) see indic. refs.; from α -chloroethyl chloroacetate on htg. with 0.02% ZnCl₂ see (23); from 2-(chloroacetoxy)hexene-1 with HCl gas see (24), from CH₂Cl₂ (3:5020) + AlCl₃ + CO gas at 200° and 900 atm. see (41).

Č on htg. with Na₂CO₃ (25) or with KNO₃ (81% yield (26)) gives chloroacetic acid anhydride (3:0730) q.v., m.p. 46°. — Č treated at −5° with HI gas gives (68% yield (27)) chloroacetyl iodide, b.p. 36.5° at 4 mm. (27). [For behavior of C with HBr gas see (40).]

Č with MeOH yields (28) methyl chloroacetate (3:5585), b.p. 131°; Č with EtOH (29) or with triethyl orthoformate (1:3241) at 100-110° (90% yield (30)) gives ethyl chloroacetate (3:5700), b.p. 144°.

[$\bar{\mathbf{C}}$ with ethylene + AlCl₃ gives (small yield (31)) 1,4-dichlorobutanone 2, b.p. 63-65° at 3 mm. (31). — $\bar{\mathbf{C}}$ with C₆H₆ + AlCl₃ gives (32) ω-chloroacetophenone (phenacyl chloride) (3:1212); $\bar{\mathbf{C}}$ with m-dichlorobenzene (3:5960) + AlCl₃ gives (33) 2,4-dichlorophenacyl chloride [Beil. VII-283], m.p. 57° (33); $\bar{\mathbf{C}}$ with biphenyl + AlCl₃ gives (77% yield (34)) p-phenylphenacyl chloride (3:3934), m.p. 122-123° (34); $\bar{\mathbf{C}}$ with naphthalene + AlCl₃ in CS₂ gives (35) cf. (36) chloromethyl β-naphthyl ketone.]

[\bar{C} with large excess (4 moles) MeMgBr or MeMgI gives (48-51% yield (37)) (38) 2-methylbutanol-3 (1:6170); \bar{C} with large excess C_6H_5MgBr in ether gives (31% yield (39)) 1,2,2-triphenylethanol-1 [Beil. VI-721], m.p. 87.5-88.5° (39); note that the isomeric 1,1,2-triphenylethanol-1 [Beil. VI₁-(354)] has almost same m.p., viz., 89°.]

Č hydrolyzes with aq. yielding chloroacetic acid (3:1370) q.v. — For the amide, anilide, p-toluidide, and other derivs. corresp. to Č see chloroacetic acid (3:1370).

104-107°

52.5-53°

[See also dichloromethyl chloroformate (3:5315).]

at 100 mm. (1)

(3)

Coloriess lachrymatory oil. — Note that \tilde{C} cannot by distillation be completely separated from dichloromethyl chloroformate (3:5315); the constants listed above are on samples contg. (1) about 9% of the latter, or (3) about 7% of dichloromethyl chloroformate + 2% dimethyl carbonate.

A mixt. of \bar{C} with dichloromethyl chloroformate (3:5315) has been employed as a chem. warfare agent under the names "K-Stoff," "Palite" (6). — [For studies of physiological action see (4) (5); for action on plant tissue see (7).]

[For prepn. of \tilde{C} from methyl chloroformate (3:5075) or from methyl formate (1:1000) with Cl_2 under various conditions see (1) (2) cf. (6) (8) (9).]

 \bar{C} with aq. at ord. temp. or more rapidly on boilg. or \bar{C} with aq. alk. in çold undergoes hydrolysis (1) yielding formaldehyde (1:0145) + 2 HCl + CO₂; by detn. via oxidn. with I_2 + NaOH of the formaldehyde so produced \bar{C} may be quant. estimated cf. (10) (6); note also that this hydrolysis to formaldehyde distinguishes \bar{C} from various other closely related compounds, e.g., methyl chloroformate (3:5075), dichloromethyl chloroformate (3:5315), trichloromethyl chloroformate ("Diphosgene") (3:5515), trichloromethyl trichloroacetate (3:0290), bis-(trichloromethyl) carbonate ("Triphosgene") (3:1915), or phosgene (3:5000).

 \bar{C} (1 mole) with NaI (2 moles) in dry acetone at 20° (11) liberates I₂ also yielding formal-dehyde (1:0145) + CO, but the reaction is *not* quantitative proceeding only to about 70% theoretical (11); but \bar{C} with dry NaI at 90-100° gives (1) CO + CO₂. Note that \bar{C} with LiBr in dry acetone does *not* (11) liberate bromine; in this respect \bar{C} is like methyl chloroformate (3:5075) but different from dichloromethyl chloroformate (3:5315) and trichloromethyl chloroformate ("Diphosgene") (3:5515).

[Č with FeCl₃ or AlCl₃ dec. rapidly at 70° (1) (12) yielding phosgene (3:5000) and formaldehyde (1:0145).]

[$\ddot{\mathbf{C}}$ with methyl hydrogen sulfate gives (13) methyl chlorosulfonate, formaldehyde, $\mathbf{CO_2} + \mathbf{HCl}$; $\ddot{\mathbf{C}}$ with chlorosulfonic acid at 100° for 4 hrs. gives (13) chloromethyl chlorosulfonate + $\mathbf{CO_2} + \mathbf{HCl}$; $\ddot{\mathbf{C}}$ with dimethyl sulfate gives (78% yield (13)) methyl chlorosulfonate.]

[\tilde{C} with alcohols or \tilde{C} with alkali salts of phenols reacts as an acid chlorine yielding (6) the corresp. alkyl or anyl chloromethyl carbonates (1).]

[Č with K phenylcyanamide also reacts as an acid chloride giving (14) chloromethyl N-cyano-N-phenylcarbamate, m.p. 48°.]

(7)

[See also 3,3-dichloropropene-1 (3:5140).]

Note that \bar{C} has frequently been given the extremely unfortunate designation " β -chloroallyl chloride," a practice which has often led to confusion with 2,3-dichloropropene-1 (3:5190). — Note furthermore that, in addition to existing in *cis* and *trans*-configurations, the structure \bar{C} also represents the synionic mesomer of 3,3-dichloropropene-1 (3:5140); reactions of either mesomer may under certain conditions lead also to derivatives of the other. — Finally note further that in all reports prior to 1944 the material designated as \bar{C} was in all probability a mixture of the two geometrical stereoisomers.

C is a colorless oil with odor suggesting chloroform (4).

[For prepn. of the two geometrical stereoisomers by careful fractional distillation of a higher-boilg fraction obtd. from the chlorination of propylene in the semi-comml. prepn. of allyl chloride (and contg. abt. $60\% \ \bar{C} + 30\% \ 1,2$ -dichloropropane (3:5200)) see (1).]

[For prepn. of ord. \bar{C} from 1,3-dichloropropanol-2 (β , β' -dichloroisopropyl alc.) ("glycerol α -dichlorohydrin") (3:5985) by elimination of H₂O with POCl₃ (yields: 75% (4), 54% (7), 34–39% (8)) (5) or with P₂O₅ (3) (5) (10) (14) in C₅H₆ (30–40% yield (4)) see indic. refs.; note that none of the other conventional dehydrating agents (such as 85% H₃PO₄ conc. H₂SO₄, KHSO₄, SOCl₂, PCl₅ (11), PCl₃, ZnCl₂, I₂, B₂O₃ or anhydrous oxalic acid) gives satisfactory results (4); for prepn. of \bar{C} from β , β' -dichloroisopropyl benzenesulfonate by htg. at 240–250° (77% yield) see (9).]

[For formn. of ord. C from 3-chloropropen-2-ol-1 (3:5820) with PCl₃ see {12}; from 1,2,3-trichloropropane (3:5840) with NaOH (yielding (6) 12% C accompanied by 70% 2,3-dichloropropene-1 (3:5190)) cf. {13} (5); from acrolein (1:0115) with PCl₅ (yield 32% C accompanied by 16% of the mesomeric 1,1-dichloropropene-2 (3:5140) and also some 1,1,3-trichloropropane (3:5660) (12)) cf. (14); from 3,3-dichloropropene-1 (3:5140) by isomerization with conc. HCl in s.t. at 100° (14) see indic. refs.]

[For use as soil disinfectant of the mixt. of \bar{C} with 1,2-dichloropropene obtd. in manufacture of allyl chloride by chlorination of propylene see (15); for use of \bar{C} in prepn. of cellulose ethers see (16).]

Reactions involving unsaturated linkage of Č. [Č with Cl₂ adds 1 mole halogen yielding (14) 1,1,2,3-tetrachloropropane (3:6035), b.p. 179–180° cor. at 756.6 mm. (14).] — Č with Br₂ adds 1 mole halogen giving (72.7% yield (9)) (5) (3) (17) 1,2-dibromo-1,3-dichloropropane [Beil. I-112], b.p. 212° (3), 215–217° (9), 220–221° (17), 220–225° (5).

[C with fumg. HCl in s.t. at 150° blackens but does not add HCl (5).]

Reactions involving the one reactive chlorine atom of \bar{C} . Note that the 2 chlorine atoms in \bar{C} possess very different reactivities; that attached to the carbon directly connected with the double bond is inert, while the chlorine attached to the carbon in β -relationship to the unsaturated linkage is extremely reactive.

[\bar{C} with aq. KOH (1 mole) boiled for 30 hrs. {14}, or boiled with 10% aq. Na₂CO₃ (slight excess) for 2 hrs. {1}, or shaken with aq. silver oxide at room temp. for 24 hrs. (small yield (12)) gives 3-chloropropen-2-ol-1 (1-chloropropen-1-ol-3) (γ -chloroallyl alcohol) (3:5820); note that the high-boilg, stereoisomer of \bar{C} gives (76% yield (1)) the high-boilg, stereoisomer of the resultant alc., while the low-boilg, stereoisomer of \bar{C} gives (81% yield (1)) the low-boilg, stereoisomer of the resultant alc.; note also that aq. NaOH effects from the resultant γ -chloroallyl alc. the removal of HCl and also causes polymerization (1) so that use of hydrolytic conditions as mild as possible is desirable.] — [For reactn. of \bar{C} with NaSH or Na₂S see (18).].

[$\bar{\mathbf{C}}$ with Na alcoholates, NaOR, replaces the reactive chlorine atom by the alkoxy residue yielding ω -chloroallyl alkyl ethers of general formula RO—CH₂—CH = CHCl: e.g., $\bar{\mathbf{C}}$ with NaOMe refluxed 4 hrs. gives (12) 1-chloro-3-methoxypropene-1, b.p. 107-108°, $D^{27}=1.032,\ n^{27}=1.431$ (12) (note proximity of b.p. to that of ord. $\bar{\mathbf{C}}$) (for study of kinetics of this reactn. see (19)); $\bar{\mathbf{C}}$ with NaOEt refluxed for 4 hrs. (12) or $\bar{\mathbf{C}}$ with alc. KOH (5) yields 1-chloro-3-ethoxypropene-1 [Beil. I-439], b.p. 126-127°, $D^{16}=1.018,\ n^{16}=1.438$ (12); for corresp. reactns. of $\bar{\mathbf{C}}$ with Na derivs. of benzyl alc. (1:6480), β -phenylethyl alc. (1:6505), γ -phenyl-n-propyl alc. (1:6520), and cinnamyl alc. (1:5920) together with physical consts. of prods. see (20).]

[C with alkali metal phenolates replaces the reactive chlorine atom by the aryloxy residue yielding ω-chloroallyl aryl ethers of general formula RO.CH₂.CH = CHCl; e.g., $\bar{\mathbf{C}}$ with Na phenolate in abs. alc. refluxed $\frac{1}{2}$ hr. (21), or $\bar{\mathbf{C}}$ with phenol (1:1420) + dry K₂CO₃ in boilg. acetone (8), gives (yields: 75% (21), 72% (8)) ω-chloroallyl phenyl ether, b.p. 120-121° at 20 mm. (21), 122-127° at 27 mm. (8), $D_4^{15} = 1.146$ (21), $n_D^{20} = 1.5421$ (8), $n_D^{15} = 1.5447$ (21); for corresp. reactn. with salts of o-cresol (1:1400) (21), m-cresol (1:1730) (21), p-cresol (1:1410) (21) (8), carvacrol (1:1760) (21), thymol (1:1430) (21), β -naphthol (1:1540) (21), hydroquinone (1:1590) (21), and several other phenols (21) see indic. refs. — Note that these ω-chloroallyl aryl ethers upon treatment with Br₂ do not add halogen to the unsatd. linkage but instead undergo cleavage: e.g., w-chloroallyl phenyl ether (above) in CHCl₃ with Br₂ (1 mole) at 0° yields (22) phenol (1:1420) + p-bromophenol + 3-bromo-1-chloropropene-1 (see below) + ω -chloroallyl p-bromophenyl ether, b.p. 153° at 13 mm., $D_4^{11} = 1.521$, $n_D^{11} = 1.5785$ (22). — Note furthermore that these ω-chloroallyl aryl ethers with HBr or HI do not add hydrogen halide to the unsaturated side chain but instead undergo cleavage similar to that with halogens: e.g., ω -chloroallyl phenyl ether in AcOH with HBr gas (1 mole) gives (70% yield (23)) 3-bromo-1-chloropropene-1, lachrymatory oil, b.p. 130° at 760 mm., $D_4^{9.5} = 1.670$, $n_D^{9.5} = 1.5255$ (23); similarly action of HI yields (23) 1-chloro-3-iodopropene-1, lachrymatory oil, b.p. 162° at 760 mm. sl. dec., 58° at 19 mm., $D_4^{9.5} = 2.029$, $n_D^{9.5} = 1.5993$ (23).]

[C with phenols under suitable conditions can also react to effect direct nuclear alkenyla-

tion: e.g., \bar{C} with phenol (1:1420) + Na in C_6H_6 refluxed for 17 hrs. gives (17% yield (8)) o-(γ -chloroallyl)phenol, b.p. 151-156° at 31 mm., $n_2^{23} = 1.5638$ (8) (soluble in alk.), accompanied by some ω -chloroallyl phenyl ether (insol. alk.) (see above).]

[$\bar{\mathbf{C}}$ with phenol ethers undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the ω -chloroallyl group into the aromatic nucleus: e.g., $\bar{\mathbf{C}}$ (1 mole) with anisole (1:7445) (10 moles) + AlCl₃ gives (70% yield (24)) 1-(ω -chloroallyl)-4-methoxybenzene, b.p. 126° at 15 mm. (24); $\bar{\mathbf{C}}$ (1 mole) with pyrocatechol dimethyl ether (veratrole) (1:7560) (2 moles) + Zn dust (1 g.) (AlCl₃ unsuitable) gives 1-(ω -chloroallyl)-3,4-dimethoxybenzene, b.p. 162° at 15 mm., D_4^{14} = 1.168, n_D^{14} = 1.551 (24); $\bar{\mathbf{C}}$ with pyrogallol trimethyl ether (1:7145) similarly yields 1-(ω -chloroallyl)3,4,5-trimethoxybenzene, b.p. 174° at 15 mm., D_4^{18} = 1.176, n_D^{18} = 1.539 (24). — Note that such ω -chloroallyl arylethers (1 mole) upon treatment with KOH (3 moles) in an alcohol R'.OH (5 moles) give (by reactn. of the ω -chlorine and rearr. or vice versa) substituted cinnamyl ethers of the type RO.C₆H₄.CH = CH.CH₂OR', used for prepn. of various natural prods. (24).]

[\bar{C} with aromatic hydrocarbons undergoes Friedel-Crafts reactn. of the reactive halogen atom with resultant introduction of the ω -chloroallyl group into the aromatic nucleus e.g., \bar{C} with $C_6H_6+AlCl_3$ yields (25) γ-chloroallylbenzene (1-chloro-3-phenylpropene-1) (3:8737) (see below); for analogous reactions of \bar{C} with toluene (1:7405), ρ -xylene (1:7430), m-xylene (1:7420), p-xylene (1:7415), ethylbenzene (1:7410), cumene (1:7440), pseudocumene (1:7470), mesitylene (1:7455), p-cymene (1:7505), etc., see (25). — Note that the resultant γ -chloroallyl hydrocarbons add Br₂ normally (26) to the unsatd. linkage (diff. from ω -chloroallyl aryl ethers (above) which undergo cleavage); e.g., γ -chloroallylbenzene (above) with Br₂ gives γ -chloro- β , γ -dibromo- η -propylbenzene, b.p. 160° at 12 mm., $D_4^{10} = 1.727$, $n_{10}^{10} = 1.611$ (26) (for use of this prod. in prepn. of hydrocinnamaldehyde (1:0225) see (35).)]

[The direct actn. of \tilde{C} with NH₃ appears to be unreported; however, \tilde{C} with KSCN followed by alk. hydrolytic cleavage is claimed (27) to yield the expected γ -chloroallylamine. — \tilde{C} with methylamine (3 moles) in C_6H_6 gives (53% yield (28)) N-methyl- γ -chloroallylamine [Beil. IV₂-(668)], b.p. 125° (B.PkOH, m.p. 91° (28)), accompanied by a little N-methyl-bis-(γ -chloroallylamine [Beil. IV₂-(668)], b.p. 88° at 16 mm. (28). — \tilde{C} with diethylamine reacts vigorously and on making alkaline gives (75% yield (29)) (12) N,N-diethyl- γ -chloroallylamine [Beil. IV₂-(668)], b.p. 57-58° at 17 mm. (12), 55° at 9 mm. (29) (B.HCl, pl. from acetone, m.p. 221° (29); B.PkOH, ndls. from aq., m.p. 78° (29), 91° (12); B.H₂PtCl₆, m.p. 169-170° (12)). — For reactns. of \tilde{C} with tertiary amines, e.g., with Mc₃N (29), Et₃N (29), or pyridine (19), see indic. refs.]

[\bar{C} (1 mole) with aniline (2 moles) in C_6H_6 under reflux ppts. aniline hydrochloride and from the solvent gives (68% yield (30)) N-phenyl- γ -chloroallylamine, b.p. 137° at 13 mm., $D_4^{13} = 1.1456$, $n_D^{13} = 1.590$ (30); for analogous reactns. of \bar{C} with o-toluidine and m-toluidine see (30).]

[\bar{C} with excess CaBr₂ refluxed for 40 hrs. (12) or actn. of HBr on ω -chloroallyl aryl ethers (23) (discussed above) gives (58% yield (12)) 3-bromo-1-chloropropene-1 (consts. given above); similarly \bar{C} with excess powdered CaI₂ shaken at room temp. for 20 hrs. gives (65% yield (12)) (14) 1-chloro-3-iodopropene-1 (consts. given above).]

[\bar{C} with NaOAc in AcOH at 110° for 16 hrs. ppts. NaCl (70% theory (12)) and gives (50% yield (12)) γ -chloroallyl acetate [Beil. II-136], b.p. 156-159° (10), b.p. 57° at 15 mm., $D_{-}^{17} = 1.140, n_{-}^{17} = 1.444$ (12).]

 \bar{C} reacts very slowly if at all with most metals: e.g., \bar{C} with Zn dust in boilg. acetone or C with Mg in dry ether (even in pres. of I_2 , EtBr, or HgCl₂) is inert (12); however, \bar{C} with Na in tetralin (1:7550) reacts violently giving only gaseous products (12), possibly including allene (propadiene-1,2) cf. (3) (31).

[$\bar{\mathbf{C}}$ reacts readily with aryl MgBr cpds., with replacement of its active halogen atom by the aryl radical: e.g., $\bar{\mathbf{C}}$ with C_0H_5Mg Br in toluene (26) or ether (32) gives (alm. 100% yield (26)) γ -chloroallylbenzene (1-chloro-3-phenyl-propene-1 (3:8737), b.p. 76° at 13 mm. (32), $D_4^{14} = 1.073$ (26), $n_D^{15} = 1.545$ (26). — For analogous reactns. of $\bar{\mathbf{C}}$ with o-tolyl-, p-tolyl-, p-cumyl-, 2-cymyl-, p-bromophenyl-, and p-methoxyphenyl-MgX cpds. see (26); for corresp. reactn. of $\bar{\mathbf{C}}$ with α -naphthyl MgBr see (34). — For reactn. of $\bar{\mathbf{C}}$ with n-propyl MgBr see (2).]

[For reactn. of Č with diethyl sodiomalonate giving (26% yield (4)) diethyl γ-chloroallylmalonate, with diethyl disodiomalonate giving (32% yield (4)) diethyl bis-(γ-chloroallyl)malonate, or with diethyl sodio-ethyl-malonate giving (20% yield (4)) diethyl γchloroallyl-ethyl-malonate see indic. refs.]

B.P. 108° (1) 107-108° (2) 105-107° (3) (4) 106.1-107.1° at 739 mm. (5)

Oil with penetrating odor; fumes in moist air.

[For prepn. of \tilde{C} from dichloroacetic acid (3:6208) with PCl₃ (2), with HCl gas + P_2O_5 (7), with SOCl₂ (poor yield apparently because of much formation (9) of dichloro-acetic anhydride (3:6430)) (8) (9) (10) (11), with benzoyl chloride (3:6240) (73% yield (4)), or with benzotrichloride (3:6540) (12) (13) see indic. refs.; for prepn. of \tilde{C} from trichloroethylene (3:5170) by photochemical oxidn. (14) (15) (16) (3) (17) see indic. refs.; for prepn. of \tilde{C} from pentachloroethane (3:5880) with fumg. H_2SO_4 at 50-60° see (18); for prepn. of \tilde{C} from α,β -dichlorovinyl ethyl ether (3:5540) by actn. of Cl_2 see (19) (20).]

 $[\bar{C}$ with alcohols gives corresp. esters (for studies of rate of alcoholysis see (1) (21)); for reactn. of \bar{C} with various carbohydrates (22) and with cellulose (23) see indic. refs.; \bar{C} + phenol yields (20) phenyl dichloroacetate, m.p. 48°, b.p. 247.5° cor. (20); \bar{C} with β -naphthol yields (20) β -naphthyl dichloroacetate, m.p. 92-93° (20).]

[Č on warming with AlCl₃ yields (24) (25) 1,1,1,2,2,3,3-heptachloropropane (3:0200) + chloroform (3:5050) + CO + HCl.]

[$\tilde{\mathbf{C}}$ treated with dry HI gas at -5° gives (58% yield (5)) dichloroacetyl iodide, b.p. 54-54.5° at 15 mm. (5).]

Č with aq. hydrolyzes very rapidly yielding dichloroacetic acid (3:6208) q.v.; for the amide, anilide, p-toluidide, and other derivs. corresp. to Č see dichloroacetic acid (3:6208).

3:5310 DICHLOROACETALDEHYDE ETHYL
$$C_4H_8O_2Cl_2$$
 Beil. I - 614 ALCOHOLATE C_1 OH I_1 — I_2 —(677) hemiacetal) C_1 C_1 C_2 — C_2H_5 C_1 C_2 — C_3 — C_4 — C_4 — C_5 — C_5 — C_5 — C_5 — C_6 — C_7 —

Oil, spar. sol. aq. or lgr. but misc. with alc., C6H6, CHCl3.

[For prepn. of \bar{C} from dichloroacetaldehyde (3:5180) with a limited amt. abs. EtOH see (1).]

C readily changes to dichloroacetaldehyde diethylacetal (3:6110), b.p. 184°, and dichloroacetaldehyde hydrate (3:1085), m.p. 56°.

Č with boilg, aq. HCl yields (1) 2,2-dichloroethanol-1 (3:5745) + acetaldehyde (1:0100).

Č with powdered KCN (1 mole) in EtOH at 20° for 5 mm., then poured into aq., gives (38% yield (2)) ethyl chloroacetate (3:5700), b.p. 144°.

[For condensations of \bar{C} with phenol (3), p-nitrophenol (3), p-hydroxybenzoic acid (4), or p-methoxybenzoic acid (6) to yield substituted benzdioxins see indic. refs.]

Č in AcOH on warming with 2 moles phenylhydrazine yields (5) glyoxal bis-phenylosazone, yel. pl. from boilg. alc., m.p. 169-171° (5).

3:5310 (1) Oddo, Mameli, Gazz. chim ital 33, II 399-408 (1903). (2) Chattaway, Irving, J. Chem. Soc. 1929, 1042-1043. (3) Chattaway, Morris, J. Chem. Soc. 1928, 3241-3246. (4) Chattaway, Farinholt, J. Chem. Soc. 1931, 1737-1740. (5) Chattaway, Farinholt, J. Chem. Soc. 1931, 1828-1834.

3:5315 DICHLOROMETHYL CHLOROFORMATE
$$C_2HO_2Cl_3$$
 Beil. III — (Dichloromethyl chlorocarbonate) Cl_2CH — C — C III_1 -(6) III_2 -(11)

B.P. 110-111° at 760 mm. (1)
$$D_{-}^{17} = 1.558$$
 (2) $n_{D}^{22} = 1.44322$ (2) 111° (2) 114° (4) $D_{-}^{15} = 1.560$ (1) 54-55° at 100 mm. (1) 46° at 62 mm. (2)

See also text.

[See also chloromethyl chloroformate (3:5275).]

Colorless lachrymatory oil. — Note that \bar{C} cannot by distillation be completely separated from chloromethyl chloroformate (3:5275); the constants listed above from (2) represent preprs. contg. about 2.5% chloromethyl chloroformate (3:5275).

A mixt. of \bar{C} with chloromethyl chloroformate (3:5275) has been employed as a chem. warfare agent under the names "K-Stoff" or "Palite" (3).

[For prepn. of C from methyl chloroformate (3:5075) or from methyl formate (1:1000) with Cl₂ under various conditions see (1) (2) cf. (3) (4).]

 \bar{C} with aq. at ord. temp. or more rapidly on boilg., or \bar{C} with aq. alk. in cold, undergoes hydrolysis (1) yielding quantitatively CO + CO₂ + 3HCl; note that formaldehyde is not formed [dif. from chloromethyl chloroformate (3:5275)].

 \tilde{C} (1 mole) with NaI (2 moles) in dry acctone at 20° (5) liberates both I₂ and CO quant. according to the equation $2\tilde{C} \rightarrow I_2 + 2CO + 2NaCl + HCl$ [compare behavior of methyl

chloroformate (3:5075) which gives no I_2 and that of chloromethyl chloroformate (3:5275) trichloromethyl chloroformate ("diphosgene") (3:5515), and bis-(trichloromethyl)-carbonate ("triphosgene") (3:1915) all of which also give I_2]. — \bar{C} with NaBr or LiBr in dry acetone behaves in analogous fashion (5) setting free Br₂; in this respect \bar{C} is like trichloromethyl chloroformate ("diphosgene") (3:5515) but unlike methyl chloroformate (3:5075) or chloromethyl chloroformate (3:5275).

[C with FeCl₃ or AlCl₃ dec. even in cold or rapidly at 80° giving (1) phosgene (3:5000) + CO + HCl.]

[Č with aq. sodium phenolate reacts as an acid chloride giving (1) dichloromethyl phenyl carbonate, b.p. 124-125° at 14 mm., m.p. 14.5° (1).]

 $[\bar{C}]$ with aniline in aq. or C_6H_6 gives (1) both N,N-diphenylures and formanilide.

Care must be taken to avoid confusion of \tilde{C} with the isomeric 1,1,1-trichloroethane (3:5085). \tilde{C} is now comml. prod. in U.S. (14).

MISCELLANEOUS PHYSICAL PROPERTIES

Various solubility relationships. \bar{C} is almost insol. aq.: e.g., 100 g. aq. at 0° dis. 0.466 g. \bar{C} , at 20° 0.436 g. \bar{C} , at 35° 0.458 g. \bar{C} , at 55° 0.532 g. \bar{C} (15). — [For soly. of aq. in \bar{C} at 0°, 25°, and 30° (as detd. by Karl Fischer reagt.) see {16}.]

[For solv. of HCl gas in C at various temps. and press. see (10).]

[For soly. of I_2 in \bar{C} see (17).]

Binary systems contg. \bar{C} . (See also below under uses of \bar{C} .) \bar{C} + 1,2-dichloroethane (ethylene dichloride) (3:5130): for f.p./compn. data, eutectic f.p. -79° (11), and for D and vapor/liq. equil. (13), see indic. refs.

Azeotropes contg. C. C with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 77.8° (4), 77.3° (6) at 760 mm., contg. 35 (6), 30 (4) wt. % C.

Other physical props. [For study of thermal conductivity of \bar{C} sec (18).]

USES OF C

 \bar{C} is now widely used as industrial solvent and in other ways [e.g., for use of \bar{C} (40%) 1,1,1-trichloroethane (3:5085) + 20% pet. hydrocarbons as dry-cleaners' solv. see (19); for use of \bar{C} + ethylene dichloride (3:5130) as hair wash see (20); for use of \bar{C} + n-heptane (1:8575), \bar{C} + cyclohexane (1:8405), or \bar{C} + C_6H_6 (1:7400) as test mixts. for detn. of number of theoret. pl. in fractionating columns see (21); for use of \bar{C} in dewaxing of oils see (22)].

PHYSIOLOGICAL ACTION AND TOXICITY

Full treatment of this topic is beyond the scope of this work [however, for lead references see (23) (24) (25) (26) (27) (67). — For study of Č as anthelmintic see (28)].

PREPARATION OF C

From vinyl chloride (3:7010). (See also below under acetylene.) [For prepn. of Č from vinyl chloride with Cl₂ at 0-80° in light or at 180-250° in absence of light or solv. see (29) (30) (31) cf. (32); for study of photochemical addn. of Cl₂ to vinyl chloride yielding Č see (33).]

From 1,2-dichloroethylene (3:5030). [For prepn. of \tilde{C} from 1,2-dichloroethylene by addn. of HCl gas at 30-40° in pres. of AlCl₃ (88% yield) see (34) (37) (note that 1,1,2,3,4-pentachlorobutane (3:0750) is also obtd. as a by-product (35)).]

From 1,1-dichloroethane (ethylidene (di)chloride) (3:5035). [For formn. of C from ethylidene (di)chloride with SbCl₅ (3 wt. parts) on refluxing see (36).]

From 1,2-dichloroethane (ethylene (di)chloride) (3:5130). [For prepn. of \bar{C} from ethylene (di)chloride with Cl₂ in ultra-violet light at 50° (38) (39) or 25° (40), or with Cl₂ + suitable cat. at not above 60° (41), or \bar{C} (as liquid) with Cl₂ (7), or with Cl₂ in pres. of AlCl₃/NaCl/FeCl₃ at 300-425° as directed (42), or with SO₂Cl₂ + trace dibenzoyl peroxide refluxed 2 hrs. in dark (12) (yields: 80% (41), 70% (40) (12), 50% (42)), see indic. refs.]

From ethylene. [For prepn. or formn. of \tilde{C} from ethylene with Cl_2 + cat. see (43) (44) (45) (46) (47).]

From acetylene. [For prepn. of \bar{C} from acetylene with $HCl + Cl_2 + cat$. (doubtless via formn. of vinyl chloride (and subsequent addn. of Cl_2 as above) see (48) (30).]

From other sources. [For formn. of \bar{C} as by-prod. of prepn. of chloral (3:5210) see (49); for prepn. of \bar{C} from 2,2-dichloroethanol-1 (3:5745) with PCl₅ (50), or from α,β -dichloroethyl chloroformate by loss of CO under influence of AlCl₃ (51), see indic. refs.; for formn. of \bar{C} from trichloroethylene (3:5170) with HI for 2 weeks in sunlight see (68).]

CHEMICAL BEHAVIOR OF C

Dehydrochlorination. \bar{C} under suitable conditions may lose HCl in either or both of two modes yielding either or both 1,1-dichloroethylene (vinylidene (di)chloride) (3:5005) or a mixt. of the stereoisomeric 1,2-dichloroethylenes (3:5030). — [E.g., \bar{C} with alc. KOH (52) (53) (54), or with excess aq. Ca(OH)₂ at 70-80° (55) (56), or with aq. or alc. NH₃ (57), or even with Na in ether (58) gives (yields: 100% (57), 90% (55) (56)) 1,1-dichloroethylene (3:5005). — On the other hand, \bar{C} pyrolyzed at 400° over pumice contg. CuCl₂ (59) is claimed to give mainly 1,2-dichloroethylene (3:5030). — Note also that \bar{C} with MeOH over Al₂O₃ at 290° gives (60) a mixt. of both prods. together with MeCl (3:7005).]

[Note in this connection that \bar{C} with aq. + Zn, Fe, or Al at 100–120° under press. yields (61) vinyl chloride (3:7010); perhaps this occurs by way of the above dichloroethylenes as intermediate.]

Halogenation of \bar{C} . Chlorination. $[\bar{C} \text{ with } Cl_2 + AlCl_3 \text{ at } 70-80^{\circ} \text{ yields (62) } 1,1,2,2-$ tetrachloroethane (acetylene tetrachloride) (3:5750).]

Fluorination. [\bar{C} with HgF₂ under press. at 140° gives (63) 50% 1,2-dichloro-1-fluoro-ethane + 10% 2-chloro-1,1-difluoroethane; for behavior of \bar{C} with SbF₃ + Br₂ at 160°, with SbF₃ + SbCl₅, or with SbF₃Cl₂ see (63).]

Behavior of C with other inorganic reactants. [C with alkali hydroxide on fusion at 250-300° yields (64) salts of glycolic acid (1:0430).]

Behavior of \tilde{C} with organic reactants. [\tilde{C} with 1,2-dichloroethylene (3:5030) + 1% AlCl₃ at 35-40° for 5 days yields (37) a mixt. of two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., the liq. isomer (3:9068) and the solid isomer (3:0750). — \tilde{C} + trichloroethylene (3:5170) + 1-2% AlCl₃ at 40° for 7 days yields (37) 1,1,1,4,4-pentachlorobutene-2 (3:9054).]

[\bar{C} with C_6H_6 + AlCl₃ gives (31% yield (65)) 1,1,2-triphenylethane, b.p. 211° at 14 mm., accompanied by diphenylmethane and 1,2-diphenylethylene (stilbene).]

[C with C6H5MgBr in toluene does not react even at 100° (66).]

Comment on Fujiwara reaction. Č does not respond to Fujiwara reactn. (pyridine + NaOH) (23).

B.P.
$$115^{\circ}$$
 (1) $n_{\rm D}^{30.5} = 1.4550$ (1) $45-45.5^{\circ}$ at 40 mm. (1)

[For prepn. of \tilde{C} (together with other products) from butadiene-1,3 with Cl_2 , either directly or in CHCl₃, CS_2 or lgr. soln., see (1) (2); the process can be controlled so as to yield little or no 1,2,3,4-tetrachlorobutane but rather a mixt. of \tilde{C} and 1,4-dichlorobutene-2 (3:5725) in the ratio 2:1 (1) (2).]

C does not (1) rearr. to 1,4-dichlorobutene-2 (3:5725) even on htg. at 90° in a s.t. — However, C in the presence of a metal halide cat. (3) such as AlCl₃ (4) rearr. by allylic transposition to 1,4-dichlorobutene-2.

Č on htg. at 90° with 2 pts. solid KOH loses HCl yielding (1) (2) 1-chlorobutadiene-1,3 (3:7210), b.p. 85° (1) (2); under certain conditions, however, Č with KOH loses HCl to yield (5) 2-chlorobutadiene-1,3 (chloroprene) (3:7080).

Č on htg. in alc. with Zn dust yields (1) butadiene-1,3.

 $\tilde{\mathbf{C}}$ with \mathbf{Cl}_2 yields solely (1) the liq, isomer of 1,2,3,4-tetrachlorobutane (3:9082).

 \bar{C} treated directly with O_3 at 0° , then with aq., yields (1) α,β -dichloropropionaldehyde (3:9034), b.p. 73° at 50 mm. (1), + formaldehyde (1:0145). — \bar{C} on oxidn. with dil. alc. KMnO₄ gives (1) α,β -dichloropropionic acid (3:0855), m.p. 50° (1).

3:5350 (1) Muskat, Northrup, J. Am. Chem. Soc. 52, 4043-4055 (1930). (2) Muskat (to du Pont), U.S. 2,038,593, Apr. 28, 1936; Cent. 1936, II 3358; C.A. 30, 3912 (1936). (3) I.G. 3:5356 CHLOROMETHYL ACETATE CH₃.CO.O.CH₂Cl C₃H₅O₂Cl Beil. II - 152

п₁---П₂-(166)

```
B.P. 115-116^{\circ} at 757 mm. (1) D_{14,2}^{14,2}=1.1953 (1) (13) 115^{\circ} at 757 mm. (13) 115^{\circ} (5) 113-115^{\circ} (2) (12) 110-112^{\circ} (3) 58-62^{\circ} at 290 mm. (4)
```

Colorless liq. with penetrating odor. — Insol. cold aq.; sol. alc., ether. — Sol. in cold conc. H_2SO_4 with evolu. of HCl (1) (13).

[For prepn. of \bar{C} from methyl acetate (1:3005) with Cl₂ in cold (1) (5) and in sunlight (2) (6), or with SO_2Cl_2 in sunlight (6), see indic. refs.; from polyoxymethylene with AcCl (3:7065) in s.t. at 100° (6) or by htg. in pres. of $ZnCl_2$ (61% yield on AcCl (4)) cf. (7) (8) (note that crude \bar{C} may be more or less contaminated with bis-(chloromethyl ether) (3:5245), b.p. 105°, and Ac₂O (1:1015), b.p. 140°, apparently produced by disproportionation of \bar{C} itself during the htg. (7).]

C on slight warming with aq. readily dissolves by virtue of hydrolysis, yielding (1) (5) (3) formaldehyde (1:0145), AcOH (1:1010), and HCl.

[Č with alcs. or Na alcoholates (10) presumably first yields alkoxymethylacetates: e.g., Č with Na benzylate in C₆H₆ refluxed for 4 hrs. gives (15% yield 4)) benzyloxymethyl acetate, b.p. 152-155° at 29 mm. (4); however, the usual type of prod. consists of a mixture of formaldehyde dialkylacetal and alkyl acetate (perhaps formed by interchange of radicals between the initial product and the alcohol (9)): e.g., Č with benzyl alc. (1:6480) gives (9) (10) (13) formaldehyde dibenzylacetal, b.p. 188-190° at 13 mm., + benzyl acetate (1:3751), b.p. 217°; Č with n-propyl alc. (1:6150) gives (9) (13) formaldehyde din-propylacetal [Beil. I-575, I₁-(301), I₂-(639)], b.p. 137° at 760 mm., + n-propyl acetate (1:3075), b.p. 101.6°; for analogous behavior of Č with MeOH (1:6120) and EtOH (1:6130) see (10).]

[C with Na phenolate does not yield phenoxymethyl acetate but instead (45% yield (11)) phenyl acetate (1:3571); this may be accounted for in a fashion completely analogous to that suggested above in the case of alcs., but no attempt was made (11) to verify the pres. of formaldehyde diphenylacetal (diphenoxymethane) although the latter [Beil. VI-150] is well known.]

 $\bar{\mathbf{C}}$ with NH₃ in dry ether gives {12} {13} acetamide, NH₄Cl + formaldehyde (often in the form of hexamethylenetetramine {13}). — $\bar{\mathbf{C}}$ with aniline (1.5 moles) in dry ether gives (80% yield {12}) acetanilide, m.p. 114–115°, + 1,3,5-triphenyltrimethylenetriamine ("anhydroformaldehydeaniline") [Beil. XXVI-3], yel. pr., m.p. 140–141° (produced by actn. of the liberated formaldehyde upon the excess of aniline). — $[\bar{\mathbf{C}}$ (1 mole) with N,N-dimethylaniline (2 moles) + ZnCl₂ at 110–120° gives (5) salt of 4,4'-bis-(dimethylamino)-diphenylmethane [Beil. XIII-239, XIII₁-(71)], m.p. 91°.]

Č with pyridine forms an unstable addn. cpd. (12); Č with quinoline forms (12) an addn. cpd., m.p. 214-216° dec., eas. sol. in abs. alc. but easily pptd. with dry ether (12).

[Č with N-potassiopyrrole in dry ether gives (18% yield (14)) N-pyrrylmethyl acetate, b.p. 59-63.5° at 3 mm., $D_{\rm s}^{20} = 1.0916$, $n_{\rm D}^{20} = 1.4907$ (14).]

[For study of rate of reactn. of C with KI in acetone at 20° and 25° see (2).]

 $\bar{\mathbf{C}}$ is also sometimes designated as " α -epichlorohydrin" to distinguish it from the less common " β -epichlorohydrin" = β -chlorotrimethylene oxide.

 $\ddot{\mathbf{C}}$ is liq. with odor suggesting chloroform. — $\ddot{\mathbf{C}}$ is spar. sol. aq. (see also below) but misc. with alc. or ether.

MISCELLANEOUS PHYSICAL PROPERTIES

Solubility relations. \tilde{C} with aq. forms two layers: the lower layer conts. the following no. of g.'s \tilde{C} per 100 g. satd. soln.: at 25° 98.48 g., at 45° 97.43 g., at 70° 95.82 g., at 80.4° 94.17 g.; the upper layer conts. per 100 g. satd. soln.: at 30.2° 6.60 g., at 52.0° 7.53 g., at 65.0° 8.45 g., at 72.0° 9.34 g., at 80.2° 10.43 g. (5).

Binary azeotropes contg. \bar{C} . \bar{C} with aq. forms a homogeneous const. boilg. mixt., b.p. 88°, contg. 75% \bar{C} ; at 25° this azeotrope seps. into two layers contg. respectively 98% \bar{C} and 7% \bar{C} (17).

[$\bar{\mathbf{C}}$ with AcOH (1:1010) forms (9a) a const.-boilg. mixt., b.p. 115.05° at 760 mm., contg. 65.5 wt. % $\bar{\mathbf{C}}$; $\bar{\mathbf{C}}$ with tetrachloroethylene (3:5460) forms (9b) a const.-boilg. mixt., b.p. 110.12° at 760 mm., contg. 51.5 wt. % $\bar{\mathbf{C}}$.]

[Note that \bar{C} with EtOH (1:6130) (9c) or with formic acid (1:1005) (9d) forms no azeotropes.]

Ternary systems contg. \bar{C} . [For extensive study of system $\bar{C} + AcOH + aq. see (5).]$

MISCELLANEOUS PHYSIOLOGICAL AND BIOCHEMICAL BEHAVIOR OF Č

[For study of toxicity of \tilde{C} see (27); for effect on proteins see (28); for effect on wire worms see (29).]

USES OF C

The uses of \bar{C} both as solvent and as chemical intermediate (see below) are manifold and cannot here be reviewed in detail [however, for use of \bar{C} in stabilization of nitrate esters (30), in refining of mineral oil (31), or in treatment of cellulose fibers to improve dyeing with acid dyes (32) see indic. refs.].

PREPARATION OF C

[For prepn. of \bar{C} from 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985) with aq. Ca(OH)₂ (22) (16) (33), with aq. NaOH (4) (13) (17) (34) (37) cf. (35), with alc. NaOH (36), with ether + NaOH (38), with solid NaOH (39), or with aq. KOH (2) (1) (yields: 95% (33), 92.5% (36), 90% (13) (16) (34),85% (17),79% (2),76-81% (38),67-72% (22),70% (17),60% (4)) see indic. refs.; for patents on prepn. of \bar{C} from this source by use of various alk. materials see (40) (41) (33) (37), note that during this type of prepn. of \bar{C} some glycerol (1:6540) is also formed (38) (44).]

[For prepn. of \tilde{C} from 2,3-dichloropropanol-1 (" β -dichlorohydrin") (3:6060) with aq. alk. see (42) (for studies of kinetics of this loss of HCl see (43)).]

[For form. of \bar{C} from glycerol (1:6540) with PCl₃ (45), with HCl (1) (50), or S₂Cl₂ (50) see indic. refs.]

[For form. of \tilde{C} from sodium salt of γ -chloro- β -hydroxy-n-propyl hydrogen sulfite (itself obtd. from \tilde{C} + NaHSO₃) on treatment with NaOH see (46).]

[For formn. of C from 1-bromo-3-chloropropanol-2 (see below) by loss of HBr by actn. of conc. KOH see (1).]

CHEMICAL BEHAVIOR OF C WITH INORGANIC REACTANTS

Reduction of C. [C with Na/Hg in moist ether is very slowly attacked and some allyl alc. (1:6145) (together with other prods.) is formed (47). — Note, however, that reactn. of C with Na in ether is very complicated and the prods. and mode of their formn. are disputed (48) (49) (44) (50) (51).] — (For behavior of C with HI see below.)

Oxidation of \tilde{C} . [\tilde{C} on oxidn. with HNO₃ (D=1.38) gives (52) β -chloro- α -hydroxy-propionic acid (β -chlorolactic acid) [Beil. III-286, III₁-(110), III₂-(209)], eas. sol. aq., alc., ether, cryst. from C_6H_6 (53), m.p. 77° (53), 77-78° (52) (for resolution of this prod. into opt. act. forms, d-form, m.p. 91.5°, see (54)). — Note that this prod. is also obtd. by oxidn. of 3-chloropropanediol-1,2 (" α -monochlorohydrin") (3:9038) q.v.]

Halogenation of Č. [$\bar{\mathbf{C}}$ with Cl₂ in diffuse light gives (55) γ, γ -dichloropropylene oxide [Beil. XVII-9], oil, b.p. 170°. — $\bar{\mathbf{C}}$ with Br₂ at 100° gives (56) (57) x, x, x-tribromo- γ -chloropropylene oxide [Beil. XVII-9], oil, which on shaking with aq. forms a crystn. tetrahydrate, m.p. 55° (56).]

Behavior of \tilde{C} with water (or dil. acids). [\tilde{C} with aq. at 100° (6) in s.t. (1) cf. (60) or on boilg, for 14 hrs. (58) adds H₂O giving (80% yield (58)) 3-chloropropanediol-1,2 (α -

monochlorohydrin) (3:9038). This process is greatly facilitated by the pres. of dil. acids: e.g., for use of dil. H_2SO_4 (yields: 85-90% (34) cf. (59), 80% (36)) or formic acid (66% yield (212)) see indic. refs.; for study of kinetics of this reactn. incl. influence of various acids and salts see (6) (19) (61) (62); for patent on use of dil. acids or acid-reacting salts see (63). — Note, however, that \bar{C} with aq. contg. 3-20% H_2SO_4 at $100-250^\circ$ under press. gives (72) acrolein (1:0115).]

Behavior of \bar{C} with halogen hydracids (HX). With HF. [\bar{C} with 30% HF soln. reacts vigorously yielding (64a) 3-chloropropanediol-1,2 (" α -monochlorohydrin") (3:9038) and other prods.; note that \bar{C} with HF under some circumstances appears to yield (64b) polymers.]

With HCl. [\bar{C} with conc. HCl shaken several hrs. at room temp. (3) (4) cf. (19) (65), or \bar{C} with HCl gas (51) in AcOH (11), gives (80% yield (4)) 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985).]

With $\dot{H}Br$. [\ddot{C} with const.-boilg. HBr (D=1.48) as directed (66) cf. (1) gives alm. quant. yield 1-bromo-3-chloropropanol-2 [Beil. I-365, I₁-(185), I₂-(385)], b.p. 197° at 760 mm. (66), 92° at 20 mm. (66), $D_4^{20}=1.726$ (67), $n_D^{25}=1.5140$ (67) (corresp. bis-(N-phenylcarbamate), m.p. 73° (68)).] (See below under reactn. of \ddot{C} with metal bromides.) With HI. [\ddot{C} with 66% HI (69) cf. (66) (1) gives 3-chloro-1-iodopropanol-2 [Beil. I-366, I₁-(186), I₂-(386)], b.p. 226° (1), 107° at 19 mm. (66), 110° at 9 mm. (69).] (See also below under behavior of \ddot{C} with metal iodides.)

Behavior of \tilde{C} with oxygenated inorganic acids. [\tilde{C} with conc. H_2SO_4 (70) or 84% H_2SO_4 in cold (71) gives a corresp. mono (acid sulfate) ester [Beil. I-474, I_2 -(538)], but whether this HSO_4 group is attached through oxygen to the first or second carbon atoms of \tilde{C} is unknown.]

[\bar{C} with HNO₃ at not above 20° as directed (73) gives 42% yield of a mononitrate ester of 3-chloropropanediol-1,2 (" α -monochlorohydrin"); \bar{C} with fumg. HNO₃ at 0° gives (74) γ -chloropropylene glycol dinitrate [Beil. I-474]; \bar{C} with mixed HNO₃ + H₂SO₄ gives (75) a mixed nitrous/nitric ester [Beil. I-474] of 3-chloropropanediol-1,2 (3:9038).]

[For analogous reactns. of \bar{C} with H_3PO_4 (71) (89) or with $HClO_4$ in ether (76) see indic. refs.; for behavior of \bar{C} toward HOCl see (77).]

Behavior of C with salts of inorganic acids. (For behavior with NaCN, etc., see below under organic reactants.)

With metal chlorides. [\bar{C} in dry ether adds anhydrous ZnCl₂ giving (78) ClCH₂CH-(OZnCl).CH₂Cl; \bar{C} in dry ether adds anhydrous MgCl₂giving (78) ClCH₂CH (OMgCl)CH₂Cl; both these cpds. on hydrolysis yield (78) 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985). — Note also that \bar{C} (2 g.) with MgCl₂ (1 g.) + aq. (2 ml.) + abs. alc. (5 ml.) in st. at 125° for 6 hrs. (79) cf. (11) gives Mg(OH)₂ + 1,3-dichloropropanol (above); \bar{C} with alc. FeCl₃ gives (11) Fe(OH)₃ + 1,3-dichloropropanol-2 (above).] (See also below under reactn. of \bar{C} with RMgX cpds.)

With metal bromides. [C (1 mole) with MgBr₂ (1 mole) in dry ether gives (80) similarly ClCH₂.CH(OMgBr).CH₂Br which on hydrolysis yields (80) 1-bromo-3-chloropropanol-2 (props. given above under reactn. of C with HBr).] (See also below under reactn. of C with RMgX cpds.)

With metal iodides. [C with dry KI in st. at 100° for several days (1), or C with KI (2 moles) in abs. alc. at 80-85° for 11 hrs. (81), or C with NaI (1 mole) in acctone refluxed 21 hrs. (82), gives (40% yield (82)) 3-iodo-1,2-epoxypropane ("α-epiiodohydrin") [Beil. XVII-10], b.p. 167° (1), 64° at 24 mm. (82), 62° at 24 mm. (81).]

 $[\bar{C}$ with conc. aq. MgI₂ soln. gives alm. quant. yield (170) 3-chloro-1-iodopropanol-2 for whose constants see above under behavior of \bar{C} with HI.]

With alkali sulfides. [For patents on behavior of C with aq. Na₂S see (83) (84).] (See also below.)

With alkali sulfites. [C with NaHSO₃ in s.t. at 100° (11) or htd. under reflux (85) (86) or in cold (87) gives sodium salt of 3-chloro-2-hydroxy-n-propyl hydrogen sulfite [Beil. I-474, I₂-(538)].]

[\bar{C} (1 mole) with conc. aq. Na₂SO₃ (2 moles) htd. under reflux 1½-2 hrs. (46) or \bar{C} with conc. aq. K₂SO₃ (85) gives corresp. salts of "glycerol disulfonic acid."]

[For behavior of C with Na₃PO₄ (15), with Na₂HPO₄ (88), or with Na₃AsO₃ (90) see indic. refs.]

Behavior of \bar{C} with other non-nitrogenous inorganic reactants. $[\bar{C}$ with PCl₃ gives an addition prod. (91) which with aq. regenerates \bar{C} and also forms H_3PO_3 . — \bar{C} with PCl₅ yields (1) 1,2,3-trichloropropane (3:5840) + POCl₃.

[$\bar{\mathbf{C}}$ with S₂Cl₂ gives (92) 67% 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985) + 33% α , α '-dichloroacetone (3:0563). — $\bar{\mathbf{C}}$ with SO₂Cl₂ + AlCl₃ in CCl₄ gives (93) β , β '-dichloroisopropyl chlorosulfonate.]

[\bar{C} in alk, soln. treated with H₂S at 0° gives (94) β -chloro- α -hydroxy-n-propyl mercaptan, b.p. 60° at 1.3 mm., $D_{-}^{20} = 1.2981$, $n_{D}^{20} = 1.5257$ (94); at 50°, however, further loss of HCl occurs yielding by ring closure (94) β -hydroxytrimethylene sulfide, b.p. 57° at 1.3 mm., $D_{-}^{20} = 1.2130$, $n_{D}^{20} = 1.5433$ (94). — Note, however, that \bar{C} treated directly at 125° with H₂S gives (95) bis-(β -chloro- α -hydroxy-n-propyl) sulfide, oil, undistillable without decn. even at 2 mm. (95).]

[$\bar{\mathbf{C}}$ with AcCl₃ gives (96) tris- $(\beta,\beta'$ -dichloroisopropyl)arsine, b.p. 88–93° at 10 mm., $D_4^{10} = 2.145$ (96).]

Behavior of $\bar{\mathbf{C}}$ with NH₃ and other inorganic nitrogen cpds. $[\bar{\mathbf{C}}$ satd. repeatedly with NH₃ gas as directed (97) gives tris-(β -chloro- α -hydroxy-n-propyl)amine [Beil. IV-291], m.p. 92-93° (corresp. $\bar{\mathbf{B}}$.HCl, m.p. 173° (97)); note that from the reactn. prod. of $\bar{\mathbf{C}}$ with ethyl acetoacetate treatment with excess alc. NH₃ gives (98) 3-chloro-2-(1?)-aminopropanol-1(2?) [Beil. IV-291].]

[Č in alc. with NH₃ gas or Č in alc. with NaNH₂, or Č with aq. NH₄OH (11) (99) gives a reactn. prod. of undetermined constitution, useful in productn. (100) of vat dye printing pastes.]

[Č with hydrazine hydrate at 100° for 30 min. or in alc. under reflux for 5 hrs. gives (101) γ -hydrazinoepihydrin which with ZnCl₂ at 100° gives (101) pyrazole [Beil. XXIII-39, XXIII₁-(15)], m.p. 69.5-70° (101).]

[For behavior of \bar{C} with basic potassium iminodisulfonate, $KN(SO_3K)_2$, leading to dipotassium epihydrin-N,N-disulfonate (102) (103), or with basic potassium hydroxylaminedisulfonate, $KON(SO_3K)_2$, leading to dipotassium epihydrinhydroxylamine-N,N-disulfonate (104), see indic. refs.]

CHEMICAL BEHAVIOR OF C WITH ORGANIC REACTANTS

BEHAVIOR OF C WITH HYDROXY AND MERCAPTO COMPOUNDS

With monohydric alcohols. \bar{C} with alcohols reacts to give by opening of the oxide ring the corresp. primary ethers of 3-chloropropanediol-1,2(" α -monochlorohydrin") (3:9038). $[\bar{C}$ with MeOH (1:6120) in pres. of H_2SO_4 (105) (66) (106) (107), or \bar{C} with MeOH at elev. temp. under press. (108), or \bar{C} with MeOH + BF₃ (109), gives (yields: 88–90% (105), 89% (106), 74.5% (109)) γ -chloro- β -hydroxy-n-propyl methyl ether ("chloromethylin") [Beil. I_2 -(538)], b.p. 173° at 752 mm. (105), 172° (106), 170.5–171.5° (109), 95° at 20 mm. (106), $D_4^{20} = 1.1648$ (109), $n_2^{20} = 1.4474$ (109). — Note, however, that \bar{C} with MeOH in pres. of KOH gives (110) (111) glycerol α , α' -dimethyl ether (β , β' -dimethoxy-isopropyl alc.)

[Beil. I-512, I₂-(590)], b.p. 167-168° at 760 mm., 65.5-66.0° cor. at 9 mm. (113), $D_4^{20} = 1.0085$ (113), $D_4^{25} = 1.012$ (111), $n_D^{25} = 1.4183$ (111), $n_D^{20} = 1.4192$ (113) (corresp. p-nitrobenzoate, m.p. 43° (112)).]

[$\bar{\mathbf{C}}$ with EtOH (1:6130) in pres. of H₂SO₄ refluxed 6 hrs. (17) or 20 hrs. (106) gives (yields: 80% (106), 76% (17)) γ -chloro- β -hydroxy-n-propyl ethyl ether ("chloroethylin") [Beil. I-474, I₂-(538)], b.p. 183–184° (106), 104–106° at 60 mm. (17), 95–100° at 20 mm. (106), $D_4^{25} = 1.107$ (17), $n_D^{25} = 1.442$ (17). — Note, however, that $\bar{\mathbf{C}}$ with EtOH + KOH gives (110) glycerol α , α' -diethyl ether (β , β' -diethoxyisopropyl alc.) [Beil. I-512], b.p. 191° at 760 mm. (13) (111), 108–109° at 60 mm. (111), 61.5–62.0° cor. at 2 mm. (113), $D_4^{25} = 0.952$ (111) (13), $D_4^{20} = 0.9514$ (113), $n_D^{25} = 1.419$ (111) (13), $n_D^{20} = 1.4200$ (113).]

[For corresp. behavior of \tilde{C} with *n*-butyl alc. (1:6180) + H₂SO₄ (106), with isoamyl alc. (1:6200) + H₂SO₄ (106), see indic. refs. — \tilde{C} with dodecanol-1 (lauryl alc.) (1:5900) + FeCl₃ in s.t. at 160° for 18 hrs. (39% yield (114)) or with H₂SO₄ (115) gives γ -chloro- β -hydroxy-n-propyl n-dodecyl ether, b.p. 157° at 1 mm. (114), $n_D^{25} = 1.4525$ (114). — (For attempts to effect analogous reactn. between \tilde{C} and ter-butyl alcohol (1:6140) in pres. of H₂SO₄ and for physical constants on higher members of di(alkoxy)isopropyl alc. series see (113).)]

[\bar{C} with ethylene chlorohydrin (3:5552) + H₂SO₄ gives (70% yield (116)) γ -chloro- β -hydroxy-n-propyl β -chloroethyl ether, b.p. 123-125° at 18 mm. (116).]

With polyhydric alcohols. [\bar{C} with ethylene glycol (1:6465) + \bar{H}_2SO_4 gives (56% yield (117)) γ -chloro- β -hydroxy-n-propyl β -hydroxyethyl ether, b.p. 135–139° (117).]

[For presumably analogous behavior of \bar{C} with glycerol + H₂SO₄ see (118); for behavior of \bar{C} with cellulose + 50% NaOH see (119).]

With mercaptans. \tilde{C} with mercaptans behaves in general analogously to \tilde{C} with monohydric alcs. + H₂SO₄.

[E.g., \bar{C} with McSH is unreported. — \bar{C} with EtSH at 50° for 4 hrs. gives (90% yield (95)) γ -chloro- β -hydroxy-n-propyl ethyl sulfide, b.p. 114–115° at 16 mm.; note, however, that \bar{C} with EtSH in aq. KOH (i.e., KSEt) reacts differently yielding (95) 1,2-epoxy-n-propyl ethyl sulfide, b.p. 67–68° at 15 mm., $D_4^{22}=1.0196,\ n_D^{22}=1.4789.$ — \bar{C} with n-PrSH + activated carbon at 90° for 7 hrs. gives (95) γ -chloro- β -hydroxy-n-propyl sulfide, b.p. 95° at 4 mm.]

[\ddot{C} (1 mole) with benzyl mercaptan (1 mole) at 130° for 7 hrs. gives (95) γ -chloro- β -hydroxy-n-propyl benzyl sulfide, b.p. 154–156° at 4 mm.; note, however, that \ddot{C} (1 mole) with benzyl mercaptan (2 moles) in alc. NaOH gives (46) bis- $(\beta,\beta'$ -dibenzylmercapto)-isopropyl alc., m.p. 59°.]

[\bar{C} with thiophenol at 130° for 5 hrs. gives (95) γ -chloro- β -hydroxy-n-propyl phenyl sulfide, b.p. 141° at 4 mm.]

With monohydric phenols. Č with monohydric phenols reacts to give by opening of the oxide ring the corresp. primary aryl ethers of 3-chloropropanediol-1,2("a-mono-chlorohydrin") (3:9038).

[$\ddot{\mathbf{C}}$ with phenol (1:1420) (2 moles) at 110° for 10 hrs. (17), or at 150–160° under press. (120) (121) cf. (122), gives (86% yield (17)) γ -chloro- β -hydroxy-n-propyl phenyl ether (" α -monochlorohydrin γ -phenyl ether") [Beil. VI-147, VI_I-(85)], b.p. 155–156° at 16 mm. (123), 152–153° at 12 mm. (121), 125–126° at 2 mm. (17), D_4^{25} = 1.209 (17), n_D^{25} = 1.540 (17) (this prod. is also formed even in pres. of a very little NaOH (123)). — $\ddot{\mathbf{C}}$ (1 mole) with phenol (1:1420) (1 mole) + aq. NaOH (1½ moles) at ord. temp. for 24 hrs. gives (40% yield (17) (125)) (124) 3-phenoxy-1,2-epoxypropane (glycidol phenyl ether) [Beil. XVII-105, XVII₁-(50)], b.p. 243–244° cor. (124), 133° at 23 mm. (124), 115–116° at 3–4 mm. (17), D_4^{25} = 1.10 (17); this reactn. occurs so readily that this prod. has formerly been mistaken for glycerol α - γ -diphenyl ether (see following). — $\ddot{\mathbf{C}}$ with phenol (1:1420) +

alc. NaOEt under reflux {120} cf. (124) (127) yields glycerol α, α' -di(phenyl) ether (β, β' -diphenoxyisopropyl alc.) [Beil. VI-149, VI₁-(86)], lfts. from alc., m.p. 82° (120) (127), 81-82° (124), 80-81° (17).]

 \bar{C} (1 mole) with p-nitrophenol (1 mole) + aq. NaOH (1½ moles) at ord. temp. for some days gives (126) 3-(p-nitrophenoxy)-1,2-epoxypropane (glycidol p-nitrophenyl ether) [Beil. XVII₁-(51)], m.p. 67° cor. (126), 69° (127). — \bar{C} (1 mole) with 2,4-dinitrophenol (1 mole) in aq. KOH (1 mole) refluxed several days, or \bar{C} with Ag 2,4-dinitrophenolate in alc., gives (42-47% yield) (note that \bar{C} is in excess (128)) glycerol α,α' -bis-(2,4-dinitrophenyl)ether, m.p. 79° (128).]

[C (1 mole) with o-cresol (1:1400) (1 mole) + very dil. aq. NaOH at ord. temp. 9 days gives (30% yield (123)) γ-chloro-β-hydroxy-n-propyl o-tolyl ether ("α-monochlorohydrin γ -(o-tolyl) ether) [Beil. VI₁-(201)], oil, b.p. 165° at 14 mm. (corresp. N-phenylcarbamate, m.p. 113-114°); C (1 mole) with o-cresol (1 mole) + excess aq. NaOH at ord. temp. 4 days gives (131) 3-(o-toloxy)-1,2-epoxypropane (glycidol o-cresyl ether) [Beil. XVII-105], oil, b.p. 134.5° at 14 mm. (131); note, however, that C (1 mole) with Na o-cresolate (2 moles) in alc. refluxed 24 hrs. gives (37% yield (129)) cf. (130) glycerol α,α' -bis-(o-tolyl)ether [Beil. VI-354], m.p. 36-37°, b.p. 226° at 13 mm. (129) (130). — C (1 mole) with m-cresol (1:1730) (1 mole) + 20% aq. NaOH (1/40 mole) at ord. temp. for 56 days gives (67.5%) yield (126)) γ-chloro-β-hydroxy-n-propyl m-tolyl ether ("α-monochlorohydrin" γ-(mtolyl) ether) [Beil. VI₁-(186)], b.p. 167.5° cor. at 13 mm. (corresp. N-phenylcarbamate, m.p. 108-108.5° cor.); \bar{C} (1 mole) with m-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (126) 3-(m-toloxy)-1,2-epoxypropane (glycidol m-tolyl ether) [Beil. XVII₁-(51)], b.p. 139.5-140° cor. at 15 mm.; note, however, that \tilde{C} (1 mole) with Na m-cresolate (2 moles) in alc. refluxed several days gives (23% yield (129)) (130) glycerol α, α' -bis-(m-tolyl) ether [Beil. VI-378], b.p. 232° at 13 mm. (129) (130). — \bar{C} (1 mole) with p-cresol (1:1410) (1 mole) + 20% aq. NaOH ($\frac{1}{20}$ mole) at ord. temp. for 8 days gives (47% yield (123)) γ -chloro- β -hydroxy-n-propyl p-tolyl ether (" α -monochlorohydrin" γ -(p-tolyl) ether) [Beil. VI₁-(201)], oil, b.p. 165° at 14 mm. (corresp. N-phenylcarbamate, m.p. 113-114°); \bar{C} (1 mole) with p-cresol (1 mole) + excess aq. NaOH at ord. temp. gives (124) cf. (120) 3-(p-toloxy)-1,2-epoxypropane, (glycidol p-cresyl ether) [Bul. XVII-105, XVII₁-(51)], b.p. 136° at 17 mm. (124); note, however, that C (1 mole) with Na p-cresolate in alc. under reflux gives (120) (124) glycerol α,α' -bis-(p-tolyl) ether [Beil. VI-395], m.p. 88° (120) (124).]

[The analogous behavior of \bar{C} with other monohydric phenols cannot be detailed here; however, for \bar{C} with α -naphthol (1:1500) (120) (126) (132), β -naphthol (1:1540) (126) (127) (132), carvaerol (1:1760) (126), thymol (1:1430) (126), guaiacol (1:1405) (126) (127) see indic. refs.]

With dihydric phenols. [C (1 mole) with pyrocatechol (1:1520) (1 mole) + KOH (1 mole) condenses with ring closure yielding (133) (134) 5-(hydroxymethyl)-2,3-benzo-dioxane-1,4, m.p. 96°, b.p. 160° at 17 mm. (133) (134).]

[For behavior of \bar{C} with 4-acetylresorcinol (resacetophenone) see (135).]

BEHAVIOR OF C WITH ETHERS

[\bar{C} with dimethyl ether + BF₃ at -35° after reactn. and distn. gives (86.6% yield (136)) tris-(β-chloro-β'-methoxy-isopropyl) borate, accompanied by a little γ -chloro-β-hydroxy-n-propyl methyl ether (for constants see above under behavior of \bar{C} with monohydric alcs.). — \bar{C} with diethyl ether + BF₃ at 20-25° overnight followed by treatment with aq. 2N Na₂CO₃ gives mainly (136) γ -chloro-β-hydroxy-n-propyl ethyl ether (for constants see above under behavior of \bar{C} with monohydric alcs.) accompanied by ethyl alcohol (1:6130); direct distillation of the reaction mixt. without Na₂CO₃ treatment, however,

gives (136) tris-(β -chloro- β -ethoxyisopropyl) borate, b.p. 210-216° at 12 mm., D_4^{22} = 1.148 (126).]

[\bar{C} with α -halogen-methyl alkyl ethers in pres. of HgCl₂ gives (137) (105) (by ring opening and addn.) mixed formals; e.g., \bar{C} with chloromethyl methyl ether (3:7085) + HgCl₂ gives formaldehyde β , β' -dichloroisopropyl methyl acetal, etc.]

BEHAVIOR OF C WITH CARBONYL COMPOUNDS

With aldehydes. [\bar{C} with aldehydes condenses to yield the corresp. 2-alkyl-4-(chloromethyl)-1,3-dioxolanes; (however, the prod. to be expected from \bar{C} with formaldehyde (1:0145), viz., 4-(chloromethyl)-1,3-dioxolane [Beil. XIX-8, XIX₁-(610)], b.p. 126° at 750 mm. (138), has not been so reported, but rather from 3-chloropropanediol-1,2 (" α -monochlorohydrin")(3:9038)); for behavior of this prod. with solid KOH at 110° involving loss of HCl and formn. (94% yield (139)) (140) of the formal of propen-1-diol-2,3, b.p. 93-95° at 758 mm. (139), $n_{20}^{20} = 1.4336$ (139), see indic. refs.]

[\bar{C} with acetaldehyde (1:0100) + SnCl₄ in CCl₄ at 18–25° gives (45% yield (141)) 4-(chloromethyl)-2-methyl-1,3-dioxolane ("acetaldehyde γ -chloropropylene acetal") [Beil. XIX₁-(610)], b.p. 158–162° at 760 mm. (141).— \bar{C} with propionaldehyde (1:0110) + SnCl₄ in CCl₄ gives (64% yield (141)) (142) 4-(chloromethyl)-2-ethyl-1,3-dioxolane, b.p. 65–70° at 18 mm. (142). — For analogous reactions of \bar{C} with n-butyraldehyde, octanal-1, decanal-1, and dodecanal-1 see (142); with crotonaldehyde see (141).]

With ketones. $\bar{\mathbb{C}}$ with ketones condenses in completely analogous fashion to yield the corresp. 2,2-dialkyl-1,3-dioxolanes. [E.g., $\bar{\mathbb{C}}$ (converted to 3-chloropropanediol-1,2 (" α -monochlorohydrin") (3:9038) although this may be unnecessary) gives (60% yield (58)) 4-(chloromethyl)-2,2-dimethyl-1,3-dioxolane ("acetone-glycerol α -chlorohydrin"), b.p. 157° at 767 mm., $D_4^{20}=1.1079,\,n_D^{15}=1.43750$ (58). — $\bar{\mathbb{C}}$ with benzophenone (1:5150) + SnCl₄ in CCl₄ at 13-25° gives (73% yield (141)) 4-(chloromethyl)-2,2-diphenyl-1,3-dioxolane, m.p. 44.5°, b.p. 159-167° at 2-3 mm. (141). — For analogous behavior of $\bar{\mathbb{C}}$ with phenacyl bromide, camphor, and cyclopentadecanone see (141).

BEHAVIOR OF C WITH ORGANIC ACIDS

(For salts, acid chlorides, acid anhydrides, see below.)

With aliphatic monobasic acids. [$\bar{\mathbb{C}}$ with AcOH (1:1010) in s.t. at 180° for 24 hrs. (143) cf. (1) gives a mixt. of both glycerol α -chlorohydrin α' -acetate (3:6775) and glycerol α -chlorohydrin β -acetate (3:6517); $\bar{\mathbb{C}}$ with AcOH + a little FcCl₃ at room temp. for 24 hrs. gives (90% yield (144)) a prod. supposed originally (144) to be glycerol α -chlorohydrin α' -acetate (3:6775); note, however, that later workers (36) could obtain only 25% yield unless mixt. stood 15 days at room temp. or 2 days at 80° and regarded the product as glycerol α -chlorohydrin β -acetate (3:6517). $\bar{\mathbb{C}}$ with aliphatic monobasic acids contg. at least 4 carbon atoms + AlCl₃ (145) or $\bar{\mathbb{C}}$ with aliphatic, alicyclic, or aromatic acids (contg. no sulfonic acid groups) + pyridine (146) gives corresp. mono esters (probably mixt. of α - and β -) of 3-chloropropanediol-1,2 (3:9038).]

[\bar{C} with trichloroacetic acid (3:1150) undergoes ring closure (similar to that of \bar{C} with carbonyl cpds. above) giving (147) 4-(chloromethyl)-2-hydroxy-2-(trichloromethyl)-1,3-dioxolane, b.p. 99-101° at 0.11 mm., $n_D^{23} = 1.4892$.]

[$\bar{\mathbf{C}}$ with thiolacetic acid (CH₃.CO.SH) at 60° for 12 hrs. gives (76% yield {148}) γ -chloro- β -hydroxy-n-propyl thiolacetate, b.p. 100–101° at 1 mm., $D_{-}^{20}=1.2806$, $n_{D}^{20}=1.5186$; on longer htg., e.g., 35 hrs. at 60°, or even at ord. temp. on 2 weeks stgd. in diffuse light, largely rearr. to β -chloro- β -mercapto-isopropyl acetate, b.p. 69–70° at 1 mm., $D_{-}^{20}=1.2308$, $n_{D}^{20}=1.4855$ {148}.]

With HCN (or its salts). [\bar{C} with excess anhydrous HCN in s.t. at 75–85° for 90 hrs. (149) (150) cf. (151) (152), or \bar{C} with anhydrous HCN + some solid KCN in s.t. at ord. temp. for 3–4 days (153), or \bar{C} with aq. Ca(CN)₂ (154), gives (yields: 85% (153), 72% (150), 70% (151), 65% (149)) γ-chloro-β-hydroxy-n-butyronitrile [Beil. III-310], b.p. 250° dec. (151), 140° at 20 mm. (151), 134–135° at 15 mm. (153), 110–111° at 2 mm. (151), D_{-}^{15} = 1.233 (153), n_{D}^{15} = 1.4735 (153). — Note, however, that \bar{C} with aq. or alc. KCN splits out KCl giving (155) (85) 3-cyano-1,2-epoxypropane ("epicyanhydrin") [Beil. XVIII-261], m.p. 162°.]

BEHAVIOR OF C WITH SALTS OF ORGANIC ACIDS

[C with dry KOAc first at 110°, later at 150° (156) cf. (157), or at 120-135°, later 150° (18) (158), gives 3-acetoxy-1,2-epoxypropane (glycidyl acetate) [Beil. XVII-106], b.p. 168-169° (157), 167-168° (143), 162-164° at 750 mm. (158), accompanied by other prods. (for study of polymerization of this prod. see (18) (158)).]

Č with aq. K cyanate on boilg. (159) (160) or C with free isocyanic acid (from htg. cyanuric acid) in cold (160) adds yielding 5-(chloromethyl)oxazolidone-2 [Beil. XXVII-145, XXVII-(260)], pr. from aq., C₀H₀, or Ac₂O, m.p. 106° (161) (159), 105° (159).

[For behavior of C with disodium methyl phosphate (162) or with disodium glycerophosphate (163) see indic. refs.]

BEHAVIOR OF C WITH ACID CHLORIDES

 $\ddot{\mathbf{C}}$ with acid chlorides yields corresp. esters of β,β' -dichloroisopropyl alc. ("glycerol α -dichlorohydrin") (3:5985) as exemplified by the following illustrations.

With aliphatic acid chlorides. [$\bar{\mathbb{C}}$ with AcCl (3:7065) (164) in s.t. at 100° for 2 hrs. (165) or 30 hrs. (166) gives (73% yield (164)) β , β' -dichloroisopropylacetate (3:6318). — $\bar{\mathbb{C}}$ with propionyl chloride (3:7170) in s.t. at 135° for 3 hrs. gives (167) β , β' -dichloroisopropyl propionate [Beil. II₂-(221)], b.p. 208°, $D_{20}^{20}=1.2222$ (167). — $\bar{\mathbb{C}}$ with *n*-butyryl chloride (3:7370) in s.t. at 100° (166) or with exclusion of aq. in flask at 75° for 8 hrs. (167) gives β , β' -dichloroisopropyl *n*-butyrate [Beil II-271, II₂-(246)], b.p. 226-227° at 738 mm. (166), 223.5° (167), $D_{20}^{20}=1.1792$ (167), $n_{10}^{20}=1.4540$ (167). — $\bar{\mathbb{C}}$ with isovaleryl chloride (3:7560) gives (166) (168) β , β' -dichloroisopropyl isovalerate [Beil. II-312, II₂-(275)], b.p. 245° at 737 mm. (166), 127-140° at 36 mm. (168), $D_{20}^{20}=1.444$ (168), $n_{10}^{20}=1.450$ (168). — $\bar{\mathbb{C}}$ with stearoyl chloride (3:9960) in s.t. at 130° for $3\frac{1}{2}$ hrs. gives (167) β , β' -dichloroisopropyl stearate [Beil. II₂-(352)], m.p. 39.5°.]

BEHAVIOR OF C WITH ACID ANHYDRIDES

With anhydrides of aliphatic acids. [\bar{C} with Ac₂O (1:1015) in s.t. at 180° for 4 hrs. (166) or \bar{C} with Ac₂O + FeCl₃ at ord. temp. for 24 hrs. (144) gives (90% yield (144)) β,β' -dichloroisopropyl acetate (3:6318).]

With anhydrides of aromatic acids. [Č with phthalic anhydride (1:0725) + dimethylaniline at 100° is claimed (169) to give the monomolecular neutral phthalate [Beil. XIX-165] of 3-chloropropanediol-1,2.]

BEHAVIOR OF C WITH ORGANOMETALLIC COMPOUNDS (OR THEIR EQUIVALENTS)

Behavior with Grignard compounds. With RMgX cpds. from alkyl or alkaryl halides [Č with MeMgI in dry ether evolves gas (CH₄?) and after acidification yields (171) 3-chloro-1-iodopropanol-2 (for constants see above under behavior of Č with HI).]

[The reactn. of C with EtMgBr may give three different prods. (or mixtures of them) according to circumstances: the first of these is 1-bromo-3-chloropropanol-2 (for constants

see above under behavior of \tilde{C} with HBr); the second is the expected 1-chloropentanol-2 (3:8225); the third is cyclopropanol, b.p. $100-103^\circ$ (80) (172), $D_{20}^{20}=0.9110$ (80), $n_{0}^{20}=1.4129$ (80) (corresp. p-nitrobenzoate, m.p. $72.0-72.5^\circ$; 3,5-dinitrobenzoate, m.p. $108-109^\circ$; N-phenylcarbamate, m.p. $101.5-102.0^\circ$; N-(p-nitrophenyl)carbamate, m.p. $159-160^\circ$; N-(q-naphthyl)carbamate, m.p. $100.5-101.5^\circ$ (172)). — Note that \tilde{C} with EtMgBr gives (16-19% yield (67) (173)) 1-chloropentanol-2 (3:8225), while \tilde{C} with MgEt₂ gives 70-83% yield (80). — For review of earlier work on this rather complex system see (80) (173) (67).] [For behavior of \tilde{C} with 15 other RMgX cpds. leading in general to chlorohydrins of type RCH₂CH(OH)CH₂Cl see (173).]

With RMgX cpds. from aryl haldes. [\bar{C} with C₆H₅MgBr gives (18% yield (173)) (132) (174) (175) 3-chloro-1-phenyl-propanol-2 [Beil. VI-503], b.p. 254-257° (174), 153-154° at 28 mm. (174) (175), 142-144° at 23 mm. (173), $D_{25}^{25} = 1.1528$ (173), $n_{D}^{25} = 1.5470$ (173) (corresp. 3,5-dinitrobenzoate, m.p. 120-121° (173)). — For analogous behavior of \bar{C} with RMgX cpds. from α -bromonaphthalene and from p-bromanisole (p-bromophenyl methyl ether) see (132).]

Behavior with various sodio derivatives. [\bar{C} with diethyl sodiomalonate in abs. alc. at 50° does not split out NaCl but rather by ring opening, addn. of reactant, and elimination of EtOH ppts. (176) (177) cf. (178) the monosodium enolate (m.p. 172° dec. (176)) of α -carbethoxy- δ -chloro-n-valero- γ -lactone [Beil. XVIII-373, XVIII₁-(478)], set free (yields: 78% (177), 50% (176)) by acidification as an oil, b.p. 180–182° at 12 mm. (176), 175–180° at 12 mm. (177). — Note that this lactone with excess alc. NH₃ gives on evapn. (176) (179) γ -chloro- β -hydroxy-n-propylmalondiamide [Beil. III-450], m.p. 117–118°.]

[C with ethyl sodioacetoacetate in abs. alc. at 50° does not split out NaCl but rather by ring opening, etc., as in preceding case gives after acidification (yields: 80% (176), 74% (177)) α-aceto-δ-chloro-n-valero-γ-lactone [Beil. XVII-421, XVII₁-(230)], b.p. 168° at 16 mm. (177), 163° at 12 mm. (176).]

[$\ddot{\mathbf{C}}$ with ethyl sodio-benzoylacetate in abs. alc. behaves in analogous fashion yielding after acidification (180) α -benzoyl- δ -chloro-n-valero- γ -lactone [Beil. XVII-497], m.p. 105-106°.]

BEHAVIOR OF C WITH AMINES

With primary amines. With aliphatic primary amines. This reacts. appears not to to have been thoroughly studied [however, for reacts. of C with MeNH₂ (181) and use of prod. in preps. of vat dye printing pastes (182) see indic. refs.].

With alicyclic primary amines. [\bar{C} (1 mole) with cyclohexylamine (3½ moles) under reflux gives (18% yield (82)) β,β' -bis-(cyclohexylamino)isopropyl alc., m.p. 72-73°.]

With aromatic primary amines. [\bar{C} (1 mole) with aniline (2 moles) in toluene refluxed 95 hrs. gives (yield not stated (71)) 3-(phenylamino)-1,2-epoxypropane ("glycidanilide"). — \bar{C} (1 mole) with aniline (3 moles) at 140° is claimed (183) to yield β,β' -bis-(phenylamino)isopropyl alc. [Beil. XII-553], m.p. 53-54°, but later workers could obtain only viscid oils (184) or a further reactn. prod. supposed (185) to be β -(phenylamino)- β' -(diphenylamino)isopropyl alc., m.p. 350° dec. (185).]

[\bar{C} (1 mole) with p-toluidine (2 moles) might be expected to yield 3-(p-tolylamino)-1,2-epoxypropane, but no such cpd. appears to have been recorded. — However, \bar{C} (1 mole) with p-toluidine (1 mole) in dil. alc. (186) (184) (82) (but not in C_6H_6 (184)) opens ring to yield by addn. β -chloro- β' -(p-tolylamino)isopropyl alc., m.p. 85° (184), 81-82° (186); this prod. on htg. with p-toluidine (184) or \bar{C} (1 mole) with p-toluidine (2 moles) at 155° (186) gives β,β' -bis-(p-tolylamino)isopropyl alc., m.p. 116° (184), 113.5° (186).]

[Č with p-phenetidine hydrochloride in aq. soln. at ord. temp. especially in sunlight gives (40% yield (187)) cf. (188) N,N-bis- $(\gamma$ -chloro- β -hydroxy-n-propyl)phenetidine.]

[For behavior of \bar{C} with β -naphthylamine in xylene under reflux (189), with arsanilic acid (190), or with p-aminophenol (or its ethers) (191) see indic. refs.]

With heterocyclic primary amines. [C with α -aminopyridine gives (63% yield (192)) by addn. to oxide ring and subsequent ring closure a prod., m.p. 190°, regarded as "1,2-divinylene-5-hydroxytetrahydropyrimidine."]

With phenylhydrazine. [\bar{C} with $1\frac{1}{2}$ pts. phenylhydrazine in ether at not above 15° for 10 days ppts. phenylhydrazine hydrochloride and leaves in the other 4-hydroxy-1-phenyl-pyrazolidine [Beil. XXIII-348], m.p. $103-104^{\circ}$ (193); this prod. with phenylhydrazine hydrochloride on warming in C_6H_6 (193) or \bar{C} with 2 pts. phenylhydrazine in C_6H_6 refluxed 8-9 hrs. (194) gives (58% yield (194)) 1-phenylpyrazole [Beil. XXIII-40, XXIII₁-(15)], b.p. 246.5° cor. at 765.4 mm. (194), m.p. $11-11.5^{\circ}$ (194), $D_4^{20} = 1.1127$ (195), $n_D^{20} = 1.5966$ (195).]

With secondary amines. With aliphatic secondary amines. [\bar{C} with Me₂NH presumably gives (196) β -chloro- β' -(dimethylamino)isopropyl alc., but no constants are reported in the literature, either for it or for its ring-closure derivative, 3-(dimethylamino)-1,2-epoxypropane, cf. (196); note further that the prod. to be expected from $\bar{C} + 2$ Me₂NH, viz., β,β' -bis-(dimethylamino)isopropyl alc. [Beil. IV-290] (197), although known, has not been prepd. from \bar{C} , but only by other means.]

[Č with aq. Et₂NH gives (196) (198) cf. (199) 3-(diethylamino)-1,2-epoxypropane [Beil. XVIII-583], b.p. 155–159 at 760 mm. (198), 55–60° at 15 mm. (196), 40–50° at 8 mm. (198), $D_4^{15} = 0.8876$ (196). — Č (1 vol.) with Et₂NH (3½ vols.) refluxed 2–3 hrs. gives (82% yield (200)) β , β '-bis-(diethylamino)isopropyl alc., b.p. 114° at 9 mm. (corresp. B.2PkOH, m.p. 163° (200).]

[Č with di-n-propylamine (2 moles) gives (70% yield (215)) 1,3-bis-(di-n-propylamino)-propanol-2, b.p. 99-101° at 3 mm., $D_4^{20} = 0.8624$, $n_D^{20} = 1.4483$ (215).]

With aromatic secondary amines. [\bar{C} with N-methylaniline gives (198) cf. (199) 3-(N-methylanilino)-1,2-epoxypropane, b.p. 160-162° at 30 mm. (198), 132-135° at 8 mm. (198); note, however, that \bar{C} (1 mole) with N-methylaniline (1 mole) at 100° for 4 hrs. (82) gave none of the preceding cpd. but a very small yield (2%) of β , β '-bis-(N-methylanilino)isopropyl alc., m.p. 82°, accompanied by other prods.]

[Č with diphenylamine at 160–170° under press. splits out HCl and ring-closes with loss of H₂O yielding (201) 1-phenyl-3-hydroxy-1,2,3,4-tetrahydroquinoline [Beil. XXI₁-(205)], m.p. 79°, b.p. 200° at 5 mm.]

With heterocyclic secondary amines. [\bar{C} with piperidine gives (196) (198) by elimination of HCl 3-(piperidino)-1,2-epoxypropane, b.p. 86.5-88° at 15 mm. (196), 72-77° at 8 mm. (198), $D_4^{16} = 0.9669$ (196).]

With tertiary amines. Č with tertiary amines gives quaternary salts, but this reactn. is often followed by opening of the oxide ring and addn. of reactant.

With aliphatic tertiary ammes. [\bar{C} with alc. Et₃N (1 mole) in s.t. at 100° gives (202) a little of the corresp. quat. salt, viz., triethyl- $(\beta, \gamma$ -epoxy-n-propyl)ammonium chloride [Beil. XVIII-583]; note, however, that \bar{C} with alc. Et₃N (1 mole) in s.t. at 100° for 6 hrs. gives also (202) (203) 2-hydroxytrimethylene-1,3-bis-(triethyl-ammonium chloride) [Beil. IV-290] together with other prods.]

[For behavior of \bar{C} with N,N-dimethyl-"stenyl" amine see (204).]

With heterocyclic tertiary amines. [For study of behavior of C with pyridine see (205) (206); with quinoline see (207).]

BEHAVIOR OF C WITH OTHER NITROGENOUS REACTANTS

(Note that in the following examples reaction occurs by opening of the oxide ring and that elimination of chlorine, if it occurs at all, is effected only in a subsequent ring closure.)

- [\bar{C} (1 mole) with disodium cyanamide (1 mole) in aq. soln. at ord. temp. for 24 hrs. presumably first yields the sodium deriv. of $N-(\gamma-\text{chloro}-\beta-\text{hydroxy}-n-\text{propyl})$ cyanamide, but this immediately ring-closes giving (33% yield (208)) 5-(chloromethyl)-2-amino-oxazoline, m.p. 142°.]
- \bar{C} (1 mole) with p-toluenesulfonanilide (1 mole) + a few drops pyridine at 120° reacts vigorously giving (86% yield (209)) N-(γ-chloro-β-hydroxy-n-propyl)-N-phenyl-p-toluenesulfonamide, m.p. 96-97°; note that this prod. in boilg. alc. on treatment with NaOH loses HCl and ring-closes (92% yield (209)) to the corresp. N-(β,γ-epoxy-n-propyl)-N-phenyl-p-toluenesulfonamide, m.p. 77°.
- [Č (1 wt. pt.) with phthalimide (1 wt. pt.) at 140–150° for 3 hrs. gives (35% yield on phthalimide (210)) cf. (211) (212) N-(γ -chloro- β -hydroxy-n-propyl)phthalimide [Beil. XXI₁-(369)], m.p. 95.0–96.5° (210), 96–97° (213). Note that N-[(β , γ -epoxy)-n-propyl]phthalimide ("phthalimidoepihydrin"), m.p. 93–94° (213), has been prepd. (75% yield (213)) from 3-bromo-1,2-epoxypropane ("epibromohydrin") with K phthalimide, and in CHCl₃ with HCl gas or even directly with conc. HCl opens the oxide ring to give (213) the above N-(γ -chloro- β -hydroxy-n-propyl)-phthalimide, m.p. 96–97° (213).]

COLOR REACTION OF C

Color reaction with pyridine (and pyridine bases). \bar{C} in MeOH with pyridine and/or various "pyridine bases" gives specific color reactions; these can be used for detection of "pyridine bases," e.g., in denatured alcohol and probably vice versa; for detailed study see (214).

 \bar{C} when pure is colorless liq. — \bar{C} turns dark on exposure to light. — \bar{C} on long exposure to light, acids, or metals resinifies to a dark mass, m.p. above 350°, which fumes in air and dis. in fumg. HNO₃, but does not react with fumg. H₂SO₄, NH₂OH, or phenylhydrazine

nor hydrolyze with 50% KOH (13). — [For stabilization of \bar{C} by means of addn. of 1% CaCO₃ (14) or 0.1% aq. (15) see indic. refs.]

Č is sol. in 10 pts. aq. (7) but does *not* form crystn. hydrates with it (9) (for prepn. of anhydrous Č using CaSO₄ see (16)); Č is volatile with steam (9); sol. in alc., ether, CHCl₈. Č has very pronounced lachrymatory properties; for studies of this property see (17) (18).

 $\bar{\bf C}$ forms azeotropes with several org. liqs. (19); e.g., $\bar{\bf C}$ with toluene (1:7405) forms a const.-boilg. mixt., b.p. 109.2° at 760 mm., contg. 28.5% $\bar{\bf C}$; $\bar{\bf C}$ with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 105.8° at 760 mm., contg. 36% $\bar{\bf C}$; $\bar{\bf C}$ with ethyl *n*-butyrate (1:3127) forms a const.-boilg. mixt., b.p. 117.2° at 760 mm., contg. 53% $\bar{\bf C}$; $\bar{\bf C}$ with isobutyl acetate (1:3115) forms a const.-boilg. mixt., b.p. 116.7°, contg. 30% $\bar{\bf C}$.

[For prepn. of $\bar{\mathbb{C}}$ from acetone (1:5400) with Cl_2 (188) (9) (20) (21) (22) (23) (24) (25) (yield is poor and contaminated with higher chlorination prods. especially 1,1-dichloropropanone-2 (unsym.-dichloroacetone) (3:5430) whose b.p. is very close to that of $\bar{\mathbb{C}}$); with Cl_2 in pres. of CaCO_3 (yield 82% (3)) (26) (27) (28); with Cl_2 in vapor-phase chlorination (29) (30) (21) in pres. of NiCl_2 (38); by electrolysis in HCl (97% yield (32)) (36) using Pt electrodes (with graphite or lead electrodes resultant $\bar{\mathbb{C}}$ is reduced) even using alternating current (35% yield (33)); with $\mathrm{Cl}_2\mathrm{O}$ (34); with HOCl (22) (27) (35); with EtOCl (3:7022) (1); with N-chlorourea in aq. soln. (37); or with $\mathrm{SO}_2\mathrm{Cl}_2$ (72% yield (189)) see indic. refs.]

[For prepn. of C from acctone (1:5400) with benzenediazonium chloride (solid) in pres. of CaCO₃ (39) (40), or with aq. solns. of other diazonium chlorides (especially those with negative substituents such as those from p-nitroaniline, p-chloroaniline, or 2,4-dichloroaniline) in pres. of CuCl₂ + NaOAc (41), see indic. refs.]

[For prepn. of \bar{C} from 1-chloropropanol-2 (propylene α -chlorohydrin) (3:7747) by oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (42) (43) (44) (45), $CrO_3 + dil$. H_2SO_4 (43), H_2SO_4 (44), H_2SO_4 (45), H_2SO_4 (46), or $G_3 + dil$. $G_3 +$

[For prepn. of \tilde{C} from ethyl γ -chloroacetoacetate (3:6375) (50) or from α -chloroacetoacetanilide (51) by hydrolytic cleavage with HCl see indic. refs.; from 1,3-dichloropropene-2 (3:5280) by soln. in conc. H₂SO₄ and distn. with aq. see (52); from allyl chloride (3:7035) with HgO + HOCl see (53); from 1,2-epoxypropane (propylene oxide) (1:6115) with Cl₂ at 0° see (54); from diketene + Cl₂ in cold followed by treatment with aq. see (55).]

[For use of \bar{C} in refining of mineral oils see (56); in prepn. of photosensitizing cyanine dyes see (57).]

Pyrolysis. [C passed through tube at 450° pyrolyzes into acetaldehyde (1:0100), acetone (1:5400), crotonaldehyde (1:0150) + HCl (58).]

Reduction. [\tilde{C} on reduction with Zn + HCl (7) or on electrolysis in HCl soln. using graphite or lead electrodes (32) yields acetone (1:5400); \tilde{C} on reduction with AlEt₃ etherate as directed (59) gives (70% yield) 1-chloropropanol-2 (3:7747), b.p. 78-81° at 80 mm. (59); \tilde{C} on phytochemical reduction using yeast (60) gives (25% yield) 1-chloropropanol-2 (3:7747); for polarographic study of oxidn.-reductn. potential of \tilde{C} see (61).]

Oxidation. \bar{C} on oxidn. with KMnO₄ (49) (62), HNO₈, CrO₃, etc. (62), yields chloroacetic acid (3:1370) and AcOH (1:1010). — \bar{C} with moist silver oxide yields (7) glycolic acid (1:0430), acetic acid (1:1010), and formic acid (1:1005).

Halogenation. [C with Cl₂ even in cold gives (26) more highly chlorinated acetones; e.g., C with Cl₂ at 30-40° yields (63) 1,1,3-trichloropropanone-2 (3:5957) and 1,1,1-trichloropropanone-2 (3:5620); C with Cl₂ at 50-70° yields (63) cf. (64) sym.-tetrachloro-

acetone (3:6050), unsym.-tetrachloroacetone (3:6085), and pentachloroacetone (3:6205); \bar{C} with Cl₂ at 50-100° in light (63) (65) or under press. (66) yields hexachloroacetone (3:6312). — Note that \bar{C} with Ca(OCl)₂ undergoes both chlorination and subsequent cleavage yielding (46) CHCl₃ (3:5050).]

 $[\bar{C} \text{ with } Br_2 \text{ (3 moles) at } 100^\circ \text{ yields (67) } 3,3,3-\text{tribromo-1-chloropropanone-2 [Beil. I-658], b.p. 215°; 13.0° at 25 mm.]}$

Reactions of the halogen atom of \bar{C} (see also further below under formn. of heterocyclic systems). \bar{C} with excess aq. alkali presumably yields propanone-2-ol-1 (acetol) (1:5455) and therefore reduces Fehling's soln.; the halogen atom of \bar{C} is so reactive that \bar{C} slowly neutralizes 1 equiv. alk. (68); \bar{C} with NaOEt in abs. alc. yields acetol ethyl ether (ethoxyacetone) [Beil. I-822, I₁-(418), I₂-(867)], b.p. 128° at 760 mm. (for study of rate of reaction see (69)).

[\bar{C} with phenol (1:1420) + anhydrous K_2CO_3 in acetone stirred 24 hrs. at room temp. or refluxed 3 hrs. (70) (note that in pres. of KI yield jumps to 92.5% (191)), or \bar{C} with sodium phenolate in phenol (71) (72) or in toluene (73), gives (yields: 21-23% (70), 16% (73)) phenoxyacetone (1:5534), b.p. 117-124° at 19 mm. (70) (note that \bar{C} + phenol + aq. NaOH gives only black resin (73)) (for application of this type of reactn. to other monohydric phenols such as tetralol-2 (5,6,7,8-tetrahydronaphthol-2) (74) (75) or p-terbutyl)phenol (1:1510) (75) or β -naphthol (1:1540) (191) see indic. refs.). — Note that \bar{C} with phenol (3 moles) + fumg. HCl at 100° reacts in a dif. sense to give (50% yield (76)) a tris-(hydroxyphenyl)propane of undetd. struct.; for formn. of resins from \bar{C} + phenol see (77) (78).]

[\bar{C} with KI in aq. MeOH (79) (80) or in acetone (5) gives (75% yield (80)) iodoacetone [Beil. I-660, I₁-(345), I₂-(719)], oil, b.p. 58.4° at 11 mm. (79) (oxime, pr. from pet. eth., m.p. 64.5° (79)); for study of rate of this reactn. in acetone at 0° and 10° see (5). — \bar{C} with K₂SO₃ (or Na₂SO₃) yields (81) salts of acetonesulfonic acid [Beil. IV-19, IV₂-(530)]. — For study of rate of reactn. of \bar{C} with aq. Na₂S₂O₃ see (82). — \bar{C} with Na₂S in acetone yields (83) (84) bis-(acetonyl) sulfide, m.p. 49° (83), b.p. 126° at 14 mm. (83), 125° at 18 mm. (84) (earlier work (85) using alc. as solvent could not be checked (83) (84).)]

[C with aq. NaSCN.stirred 10 hrs. at 25° (86), or C with Ba(SCN)₂ directly (87) or in alc. (88) (89) cf. (90), gives (95% yield (86)) thiocyanoacetone (acetonyl thiocyanate) [Beil. III-179, III₁-(72), III₂-(125)], oil, b.p. 73.5-74.5° at 1 mm. (86), D₁₅ = 1.1892 (86) (for use of this prod. as anti-oxidant for rubber (91), as stabilizer for cellulose (92), or as 1% soln. in petroleum as insecticide (93) see indic. refs.); note that thiocyanacetone, at though insensitive to dil. aq. HCl (87), with HCl gas in cold (86) or conc. HCl on boilg. (89) adds 1 mole HCl and ring-closes to 2-chloro-4-methylthiazole, oil, b.p. 167-167.5° at 754.4 mm., 69° at 14 mm. (86); note also that thiocyanoacetone with aq. NaHCO₃ (94) (or C + aq. KSCN + NaHCO₃ (86)) yields 2-hydroxy-4-methylthiazole (4-methylthiazolone-2) ("α-methylrhodime") [Beil. XXVII-158, XXVII₁-(264)], ndls. from aq. or ether, m.p. 105-106° (94), 102-103° (86).]

[\bar{C} with Na salts of sulfinic acids gives the corresp. alkyl- (or aryl)sulfonylacetones: e.g., \bar{C} with Na methanesulfinate gives (95) methanesulfonylacetone, m.p. 54° (95) (96); \bar{C} with Na benzensulfinate in alc. gives on refluxing (95% yield (97)) benzenesulfonylacetone [Beil. VI-307, VI₁-(145)], lfts. from alc., m.p. 57° (97); \bar{C} with Na p-toluenesulfinate yields (97) p-toluenesulfonylacetone [Beil. VI-421, VI₁-(210)], m.p. 51° (97) (98); many other analogous cases are known.]

 $[\bar{C}]$ with tertiary amines gives the corresp. quaternary ammonium chloride salts: e.g., \bar{C} with dry Me₃N in abs. ether (99) or abs. alc. (100) (101) yields trimethyl-acetonyl-ammonium chloride [Beil. IV-315, IV₂-(763)], very hygroscopic white solid; \bar{C} with pyridine gives corresp. salt (for study of rate in abs. alc. at 55.6° see (102)). — \bar{C} with triphenyl-

phosphine in C_6H_6 at 75-80° for 15 hrs. yields (103) triphenyl-acetonyl-phosphonium chloride, m.p. 234° dec. (103). — \bar{C} with hexamethylenetetramine in CHCl₃ grad. ppts. an addn. prod. (poor yield (104)), ndls., m.p. 122° (104).]

[C with dry NH₃ may yield (9) a little aminoacetone (acetonylamine) [Beil. IV-314, IV₁-(450), IV₂-(763)], but the reactn. is unsatisfactory and other methods (105) are preferred for prepn. of the latter; C (in excess) with aq. soln. (30%) of Me₂NH yields (106) dimethylaminoacetone [Beil. IV-314], misc. with aq., alc., ether, b.p. 123° (106); C (1 mole) with Et₂NH (2 moles) in ether yields (106) diethylaminoacetone [Beil. IV-316], b.p. 155-156° (106). — Many analogous cases are recorded.]

Reactions of $\bar{\mathbb{C}}$ involving the H atoms of its —CH₂Cl grouping. $\bar{\mathbb{C}}$ with salicylaldehyde (1:0205) in alc. KOH refluxed for 15 min. (107) (108), or in alc. NaOH refluxed 2 hrs. (109), or $\bar{\mathbb{C}}$ + Na salt of salicylaldehyde in dry \mathbb{C}_6H_6 under reflux (110), gives (yields: 60–85% (107), 75% (109), 60% (108)) 2-(acetyl)coumarone (2-acetobenzofuran) [Beil. XVII-338], colorless lfts. from alc., m.p. 76° (107), 75–76° (109), 74–75° (108) (110) (corresp. oxime, ndls. from dil. alc., m.p. 150° (111), phenylhydrazone, cryst. from alc., m.p. 153–154° (107), semicarbazone, ndls. from dil. alc., m.p. 217° (107)). — $\bar{\mathbb{C}}$ with p-dimethylaminobenzal)acetone, yel. lfts. from alc., m.p. 115° (112) (corresp. phenylhydrazone, m.p. 206–208° (112), semicarbazone, m.p. 202–203° (112)), accompanied by a little α -chloro- α , α -bis-(p-dimethylaminobenzal)acetone, cryst. from 1:1 abs. alc. + \mathbb{C}_6H_6 , m.p. 225° (112). — $\bar{\mathbb{C}}$ with diazotized aniline in pres. of NaOAc at 0° yields (113) (49) cf. (114) 1-(benzeneazo)1-chloroacetone [Beil. XV-342], yel. ndls. from boilg. alc., m.p. 136–137° (113), 135–136° (49).

Reactions of Č involving the keto group. \bar{C} with satd. aq. NaHSO₃ soln. yields (51) a crystn. NaHSO₃ cpd. cf. (7).

[Č with HCN as directed gives (yields: 94% (119), 87–90% (192)) (21) (115) (116) β -chloro- α -hydroxyisobutyronitrile (chloroacetone cyanohydrin) [Beil. III-317], oil, b.p. 110° at 22 mm. (117) 108–110° at 20 mm. (192), 103–104° at 16 mm. (115), $D_{-}^{15} = 1.2027$ (117), $n_D^{20} = 1.4520$ (192), $n_D^{11} = 1.45362$ (117); this prod. on distillation at ord. press. or even on stdg. in the air readily dissociates into the original components; on saponification with HCl, however, it gives (62% yield (192)) (5) (115) β -chloro- α -hydroxyisobutyric acid [Beil. III-317, III₁-(120), III₂-(224)], ndls. from C_6H_6 , m.p. 110° (118) 109–110° (192). — Č (1 mole) with aq. KCN (1 mole) gives 43% yield (119) of a cpd., $C_8H_{10}O_2N_2$, m.p. 183°, formerly supposed to be α -aceto- β -hydroxy- β -methylglutaro (di)nitrile·[Beil. III-883] but now (119) regarded as 2,4-dicyano-2,5-dimethyl-5-hydroxytetrahydrofuran (for mechanism of its formn. and review of earlier literature see (119)).]

[\tilde{C} forms acetals or similar cpds.: e.g., \tilde{C} with triethyl orthoformate (1:3241) in EtOH + a drop of H₂SO₄ gives (yields: 90% (120), 87% (80)) cf. (190) chloroacetone diethylacetal [Beil. I-654, I₂-(718)], b.p. 161-162° u.c. (120) 81-82° at 50 mm. (190), 52-53° at 14 mm. (80), $D_0^{14} = 1.002$ (120); for acetals from \tilde{C} with glycerol (1:6540) (121) or pyrocatechol (1:1520) (122) see indic. refs.]

[$\ddot{\mathbf{C}}$ with phenyl isocyanide + AcOH in ether gives (123) α -acetoxy- β -chloroisobutyranilide; $\ddot{\mathbf{C}}$ with phenyl isocyanide + BzOH in ether gives (123) α -benzoyloxy- β -chloro-isobutyranilide.]

[Č with RMgX cpds. (1 mole) in ether in general reacts normally with the ketonic group to give addn. prods. which with aq. yields the corresp. tertiary alcs.: e.g., Č with MeMgBr gives (38% yield (124)) (125) 1-chloro-2-methylpropanol-2 (\$\alpha\$-isobutylene chlorohydrin) (3:7752) (accompanied as a result of reactn. of a second MeMgBr and rearr. (126) (127) by some 2-methylbutanol-2 (1:6160)); for corresp. reactn. of Č with EtMgBr yielding

1-chloro-2-methylbutanol-2 (3:8175) see (128); for corresp. reactn. of \tilde{C} with n- C_4H_7MgBr , n- C_4H_9MgBr , iso- $C_5H_{11}MgBr$, n- $C_6H_{13}MgBr$, and n- $C_7H_{15}MgBr$ see (129); for corresp. reactn. of \tilde{C} with ter-butylethynyl MgBr (130), with n-amylethynyl MgBr (131), or with ethynyl bis-(MgBr) (132) see indic. refs. — \tilde{C} with C_6H_5MgBr yields (133) 1-chloro-2-phenylpropanol-2 [Beil. VI-507]; note, however, that if the initial addn. cpd. is htd. at 130–140° prior to hydrolysis rearr. occurs and the prod. then (134) is phenylacetone (1:5118). — For reactn. of \tilde{C} with o-xenyl MgI see (70).]

[C with abs. diazomethane (free from MeOH) in dry ether yields (135) 1-chloro-2-methyl-2,3-epoxybutane, b.p. 124° (135).]

Condensation reactions of C (usually yielding heterocyclic compounds). [Č with acetal-dehyde (1:0100) + NH₄OH in pres. of Cu(OAc)₂ gives (49% yield (136)) 2,4-(or 5)-dimethylimidazole [Beil. XXIII-79, XXIII₁-(25)], b.p. 266° at 733 mm., m.p. 92° (136) (B.HCl, m.p. 205, B.PkOH, m.p. 142-143° (136)).]

[$\bar{\mathbb{C}}$ with methyl acetoacetate (1:1705) + NH₄OH at -1° gives (16% yield (137)) 3-carbomethoxy-2,5-dimethylpyrrole [Beil. XXII-29], cryst. from alc., m.p. 119.5°; $\bar{\mathbb{C}}$ with ethyl acetoacetate (1:1710) + excess conc. aq. NH₄OH (138) (140) or in ether with NH₃ gas (139) gives (yields: 44% (139), 20% (138)) 3-carbethoxy-2,5-dimethylpyrrole [Beil XXII-29, XXII₁-(496)], m.p. 116-117° (138) (other by-prods. also being formed (139)); $\bar{\mathbb{C}}$ with ethyl acetoacetate (1:1710) + prim. amines similarly gives N-substituted analogs; e.g., use of aq. MeNH₂ gives (141) 3-carbethoxy-1,2,5-trimethylpyrrole [Beil. XXII-29, XXII₁-(496)], m.p. 48° (141); use of aniline gives (139) (141) 3-carbethoxy-2,5-dimethyl-1 phenylpyrrole [Beil. XXII-30, XXII₁-(496)], m.p. 43°, b.p. 225° at 40 mm.; for corresp. use of p-toluidine see (141).]

[Č with ethyl oxaloacetate [Beil. III-780, III₁-(273), III₂-(479)] in other treated with NH₃ gas yields (139) 4-carbethoxy-5,6-dihydroxy-2(or 3)-methylpyridine [Beil. XXII-259], m.p. 223° (139) (much oxamide and other by-prods. also being formed).]

[\bar{C} with diethyl acetonedicarboxylate (1:1772) in ether (142) (143) (139) or C_6H_6 (144) with dry NH₃ gas gives (yields: 49% (143), 38% (142)) ethyl (3-carbethoxy-4-methyl-furyl-2)acetate [Beil. XVIII-333], oil, b.p. 168° at 20 mm. (139).]

[C htd. with amides yields corresp. oxazoles: e.g., C with acetamide htd. 8-10 hrs. at 120° under reflux gives (7% yield (145)) (146) 2,4-dimethyloxazole [Beil. XXVII-17], liq. with odor like pyridine, very sol. aq., b.p. 108° (145) (146); C with benzamide + powdered CaCO₃ at 115-120° for 8 hrs. gives (15% yield (147)) (148) 2-phenyl-4-methyloxazole [Beil. XXVII-58], b.p. 238-241° (148), 92-95° at 5 mm. (147) (B.HCl, m.p. 72°, B.PkOH, m.p. 111° (147)); for corresp. reactn. of C with m-nitrobenzamide see (147).]

[Č with thioamides yields corresp. thiazoles: e.g., Č with thioformamide in abs. alc. refluxed for 1 hr. (149) or Č with formamide $+ P_2S_5$ (150) gives (35–47% yield (149)) 4-methylthiazole [Beil. XXVII-16], b.p. 131° (150), 130° (149), 70–71° at 59 mm. (151) (B.PkOH, m.p. 181° (151); B.EtI, m.p. 144.5° (149)); Č with thioacetamide without solvent (152) (153) in aq. or alc. (152) (149) or Č with acetamide $+ P_2S_5$ (150) yields 2,4-dimethylthiazole [Beil. XXVII-18], b.p. 144–145.5° cor. at 719 mm. (152), 143–144° at 762 mm. (153), 143° (150) (154), $D_4^{20} = 1.0562$ (B.PkOH, m.p. 137–138° (152), B.EtI, m.p. 212° dec. (149)); Č with thiobenzamide in alc. gives (155) (147) 4-methyl-2-phenylthiazole [Beil. XXVII-58], m.p. 29.5° (156), b.p. 282° at 762 mm. (156), 275–277° at 750 mm. (147), 111° at 6 mm. (147); many other analogous cases are recorded.]

[Č with aq. thiourea (157) (158) (159) or Č with NH₄SCN (160) (161) or Č with NH₄SCN + NH₄OH (162) (86) gives (70-75% yield (157)) 2-amino-4-methylthiazole [Beil. XXVII-159], m.p. 44-45° (157), 42° (159), b.p. 231-232° sl. dec. (162), 130-133° at 18 mm. (157), 117-120° at 8 mm. (157); Č with N-methylthiourea gives (163) (164) (158) 2-(methyl-

amino)-4-methyl-thiazole [Beil. XXVII-159], pr. from alc., m.p. 71.5-72.5° cor. (163), 64° (164) (B.HCl, m.p. 228° cor. (163)); Č with phenylthiourea gives (158) (164) 2-(anilino)-4-methylthiazole [Beil. XXVII-159], ndls. from alc., m.p. 117-118° (164), 115° (158).]

[Č with O-methyl thiocarbamate on warming gives (89) 2-methoxy-4-methylthiazole, b.p. 59-60° at 18 mm. (89) (B.HCl, m.p. 78°; B.HgCl₂, m.p. 123-124° (89)) (accompanied by its dimer); Č with O-ethyl thiocarbamate + KOAc yields (89) 2-ethoxy-4-ethylthiazole, b.p. 71-72° at 15 mm. (89).]

[Č with solid ammonium dithiocarbamate in abs. alc. stood at room temp. for 12 hrs. then refluxed 1 hr. gives (85% yield (151)) 2-mercapto-4-methylthiazole [Beil. XXVII-161], cryst. from isopropyl ether/alc. or dil. alc., m.p. 89-90° (165), 88.0-88.5° (151); note that in ether these reactants yield (166) an intermediate S-acetonyl dithiocarbamate, m.p. 80-82° (166), which on stdg. changes to the above 2-mercapto-4-methyl-thiazole; for use of the latter (or its metal salts) as vulcanization accelerators see (167).]

[C with 1-phenylthiosemicarbazide in abs. alc. readily dis. at room temp. yielding on addn. of pyridine (168) 2-(phenylhydrazino) 4-methylthiazole, m.p. 179° (acetyl deriv., m.p. 179° (168)); for analogous reactions of C with the three 1-(tolyl)thiosemicarbazides (169), the three 1-(nitrophenyl)thiosemicarbazides (170), see indic. refs.]

[C with acetone thiosemicarbazone in CHCl₃ gives on warming (171) the corresp. deriv. of 4 methylthiazolone 2, viz., 2-keto-4-methyl-2,3-dihydrothiazole-2-isopropylidenehydrazone; for analogous reactn. of C with acetophenone thiosemicarbazone and benzaldehyde thiosemicarbazone see (171).

- Color reactn. with KOH: C with excess very cone. aq. KOH gives crimson red color (5) (22).
- Acetonyl acetate (acetal acetate) (acetoxyacetone) [Beil. II-155, II₁-(72), II₂-(168)]: b.p. 174-175° at 760 mm. (172), 137-138° at 230 mm. (172), $D_4^{20} = 1.0749$, $n_D^{20} = 1.4150$ (Beil.). [From \bar{C} + KOAc in MeOH (173) or abs. EtOH (172) after 2 hrs. reflux (82% yield (173)).]
- —— Acetonyl benzoate (acetol benzoate) (benzoyloxyacetone) [Beil. IX-148]: m.p. 23.5-24° (174), 25° (175); b.p. 188-190° at 60 mm. (176). [From C with KOBz on htg. together (54% yield (176)) or in alc. soln. (174).]
- **D** 1-(β -Naphthoxy)acetone (acetonyl β -naphthyl ether): cryst. from alc., m.p. 78.4° cor. (177), 78° (178), 69-73° (191), 69-72° (70). [From \dot{C} + Na β -naphtholate on htg. in β -naphthol (178) or from \dot{C} + β -naphthol (1:1540) + dry K₂CO₃ refluxed in acetone (21% yield (70)) (note that by addn. of KI yield jumps to 85% (191)).]
- ① 1-(N-phthalimido)acetone (N-acetonylphthalimide) [Beil. XXI-477, XXI₁-(371)]: lfts or ndls. from aq., m.p. 124° (105). [From $\ddot{C} + K$ phthalimide at 120° for 20 min. (179) or refluxed 1 hr. in xylene (67% yield (180)).]
- 1-(N-3-nitrophthalimido)acetone (N-(acetonyl)-3-nitrophthalimide: ndls. from alc., m.p. 152-153° (181). [From C with K 3-nitrophthalimide on htg. (181).]
- Methylglyoxal dioxime (methylglyoxime) [Beil. I-764, I₁-(396), I₂-(822)]: pr. from alc., m.p. 156° (182). [From C with aq. soln. contg. NH₂OH.HCl (3 moles) + Na₂CO₃ (2 moles) followed by acidification and ether extraction (182); note that by careful regulation of conditions chloroacetone oxime has been obtd. (82% yield (183)), but since it is an oil, b.p. 171° at 727 mm. with slight decompn., it has no value as a for C̄.]
- 1-(β-Phenylhydrazino)acetone phenylhydrazone [Beil. XV-412]: yel. cryst. from MeOH, m.p. 162.5° (184). [From C with phenylhydrazine (3 moles) in abs. alc. at -16 to -18° (184).]
- © Chloroacetone o-nitrophenylhydrazone: m.p. 83° (135).

- ♠ Chloroacetone 2,4-dinitrophenylhydrazone: yel. ndls. from alc., m.p. 124.0-125.5° (185) (51), 124° (39). [From C (0.5 g.) with 2,4-dinitrophenylhydrazine (1.0 g.) in alc. (12 ml.) + conc. HCl (1.5 g.) under reflux (185); note that this prod. on protracted (13 hrs.) boilg. in alc. disproportionates yielding (185) C + 2,4-dinitrophenylhydrazine (both sol. hot alc.) accompanied by the spar. sol. methylglyoxal-bis-(2,4-dinitrophenyl)-osazone, cryst. from pyridine, m.p. 298° (185); for various other reactans, see (185).]
- © Chloroacetone semicarbazone: m.p. 147-148° dec. (39), 141-142° (47), 136-137° (48), 165° (50), 163-165° (44). [From C with aq. semicarbazide HCl on addn. of solid NaHCO3 at room temp. (186); note that this prod. is reactive and on boilg. with aq. dissolves to a bright yel. soln. which soon becomes colorless and ppts. hydrazine dicarboxylic acid diamide leaving in the filtrate hydroxypropanone semicarbazone, m.p. abt. 192° dec. (186); these changes (which doubtless occur slowly even on standing in water at room temp.) probably account for the divergent values of m.p. reported above.]
- © Condensation prod. ($C_{17}H_{20}O_4N_3SC1$) of \tilde{C} with N-methyl- β -carbohydrazidopyridinium p-toluenesulfonate: cryst. from 1:1 alc./ether, m.p. 135° cor. (187). [From \tilde{C} + indicated react. in abs. alc. on refluxing 15 min. (187).]

3:5430 1,1-DICHLOROPROPANONE-2
$$C_3H_4OCl_2$$
 Beil. I - 654 $(\alpha,\alpha$ -Dichloroacetone; CH_3 —C—CHCl₂ I_1 -(344) I_2 -(718) dichloromethyl methyl ketone)

B.P. 120-121° (1) (25) $D_2^{21} = 1.236$ (5) 120° (2) (10) (11) (14) 119.8-120° (3) $D_-^{20} = 1.236$ (6) 119-120° (7) 115-116° (4) $D_-^{15} = 1.234$ (1)

Colorless oil which rapidly turns yellow on expos. to light; spar. sol. aq.; eas. sol. alc., ether. — $\bar{\mathbf{C}}$ has penetrating odor, is lachrymatory, and blisters skin. — Note that b.p. of $\bar{\mathbf{C}}$ is very close to that of chloroacetone (3:5425) and that the latter is a frequent impurity in ord. samples of $\bar{\mathbf{C}}$.

[For prepn. of \tilde{C} from acetone (1:5400) with Cl_2 under various conds. see (2) (5) (7) (8) (9) (1); from acetone at b.p. with Cl_2 in pres. of I_2 , $FeCl_3$, or $SbCl_5$ (yield: 48.6% \tilde{C} accompanied by 28% sym.-dichloroacetone (3:0563) (12)) or at 70° in pres. of NiCl₂ (13)

(other prods. are also formed) or by electrolysis in HCl (9) see indic. refs.; from ethyl α,α -dichloroacetoacetate [Beil. III-663, III₁-(233), III₂-(427)] by ketonic cleavage with dil. HCl in s.t. at 170-180° for 4-6 hrs. (14) or by refluxing 4-5 hrs. with HCl (15) cf. (4) see indic. refs.; for formn. of \bar{C} from isopropyl alc. (1:6135) with Cl₂ see (16); from methylacetylene with HOCl (42% yield) see (17); from 1,1-dichloro-2-methylpropene-2 (3:7480) with O₂ see (18); from homoaspartic acid [Beil. IV-494, IV₁-(541), IV₂-(912)] by oxidn. with sodium N-chloro-p-toluenesulfonamide see (19).

[Č on reduction with Al(OEt)₃ + anhydrous acetaldehyde in dry ether gives (45% yield (20)) 1,1-dichloropropanol-2 (3:5755), b.p. 146-148°. — Č on reduction by yeast gives (54% yield (21)) levorotatory 1,1-dichloropropanol-2.]

 \bar{C} on oxidn. with conc. HNO₃, CrO₃, or KMnO₄ yields (22) dichloroacetic acid (3:6208). [\bar{C} with Br₂ (1 mole) (1) yields 3-bromo-1,1-dichloropropanone-2 [Beil. I-657], b.p. 111° at 25 mm. (1); \bar{C} with excess Br₂ at 100° yields (1) 3,3-dibromo-1,1-dichloropropanone-2 [Beil. I-658], b.p. 120° at 25 mm. (1); for study of rate of bromination of \bar{C} and influence of catalysts thereon see (4).]

 $\{\bar{C} \text{ with PCl}_5 \text{ htd. at b.p. of mixt. for 2 days yields (2) 1,1,2,2-tetrachloropropane (3:5825), b.p. 153°.\}$

 $[\bar{C}]$ with aq. in s.t. at 200° for 6 hrs. yields (23) lactic acid (1:0400). — \bar{C} with aq. alk. yields (presumably via cleavage of the expected methylglyoxal) acetic acid (1:1010) and formic acid (1:1005); by virtue of this result \bar{C} readily reduces Fehling's soln. (24). — \bar{C} with aq. 10% K_2CO_3 on boilg. loses HCl yielding (25) acrylic acid (1:1020).]

 \bar{C} with satd. aq. NaHSO₃ soln. readily yields (1) (5) an addn. prod. crystg. as a trihydrate. [\bar{C} with conc. aq. HCN slowly dis. on protracted refluxing yielding (10) the corresp. cyanohydrin (β,β -dichloro- α -hydroxy-isobutyronitrile) [Beil. III-318], an oil, which on htg. dissociates into its components; this prod., however, on hydrolysis with strong HCl yields (10) the corresp. acid, β,β -dichloro- α -hydroxyisobutyric acid (3:2145), pr. from alc./ether or cryst. from C₆H₆, m.p. 82-83° (10) (26). — Note also that \bar{C} with phenylisocyanide + aq. on stdg. yields (26) β,β -dichloro- α -hydroxy-isobutyranilide, pr. from CHCl₃, m.p. 132-133° (26).]

[C in excess McOH (5 moles) with ethyl iminoformate hydrochloride (1½ moles) 4-8 days at room temp. yields (27) unsym.-dichloroacetone dimethylacetal, b.p. 170-171° at 767 mm., 63° at 9 mm. — C in excess EtOH with ethyl iminoformate as above yields (27) unsym.-dichloroacetone diethylacetal, b.p. 183-184° at 767 mm., 76° at 8 mm.]

[\bar{C} with o-nitrobenzaldehyde in alc. treated dropwise with aq. 5% NaOH condenses yielding (28) ω , ω -dichloro-o-nitrobenzalacetone, pptd. as oil by addn. of aq., colorless pr. from C_6H_6 , m.p. 106–107° (28). — By similar procedure \bar{C} with m-nitrobenzaldehyde gives (28) ω , ω -dichloro-m-nitrobenzalacetone, colorless pr. from C_6H_6 , m.p. 116–117°; \bar{C} with p-nitrobenzaldehyde similarly gives (30% yield (28)) ω , ω -dichloro-p-nitrobenzalacetone, colorless pr. from C_6H_6 or ether, m.p. 125°.]

[$\bar{\mathbf{C}}$ with diazotized aniline in pres. of NaOAc yields (29) dichloro-bis-(benzeneazo)-methane, yel.-or. cryst. from hot alc., m.p. 81-82°; $\bar{\mathbf{C}}$ with diazotized p-toluidine in pres. of NaOAc yields (29) dichloro-bis-(p-tolueneazo)methane, or. cryst. from C₆H₆, m.p. 159-160°.

 \ddot{C} (1 mole) treated with aq. soln. of excess NH₂OH.HCl (6 moles) + Na₂CO₃ (3 moles), stood 24 hrs., and acidified yields (15) methylglyoxal dioxime (methylglyoxime) [Beil. I-764, I₁-(396), I₂-(822)], pr. from alc. or aq., m.p. 157°, 153° (15) (30); the same prod. also results if a satd. soln. hydroxylamine sulfate is used (30) in place of free hydroxylamine.

Č (1 g.) in abs. alc. (20 g.) with phenylhydrazine (2.5 g.) stood for 1½ days, then warmed with aq. (100 ml.), yields (31) as insol. residue (1 g.) methylglyoxal bis-(phenyl)osazone [Beil. XV-156, XV₁-(38)], yel. ndls. from dil. alc., m.p. 148° (31).

- ₱ 1,1-Dichloropropanone-2 semicarbazone: m.p. 163° (32). [From C in alc. with aq. semicarbazide.HCl (1 mole) without addn. of NaOAc, the semicarbazone pptg. immediately; note, however, that on stdg. the filtrate ppts. a small amt. of methylglyoxal bis-semicarbazone, m.p. 254°, also formed (together with equiv. C) on boilg. the semicarbazone with aq. (32).]

Note 1. For vap. press. of $\bar{\mathbf{C}}$ from 33–118° see (14). Note 2. For D_4^t over range $t=15-90^\circ$ see (14).

Colorless liq. widely used as solvent, etc. (see also below). — \tilde{C} is pract. insol. aq., but detailed studies do not appear to be recorded. — \tilde{C} is miscible with alc., ether, CHCl₃, C₆H₆, and many other org. solvents.

GENERAL

[For study of \tilde{C} as solvent for detn. of mol. wts. by raising of b.p. (ebullioscopic const. = 55.0° per mole solute/100 g. \tilde{C}) see (23). — For study of thermal conductivity see (24). — For soly. in \tilde{C} of gaseous HCl, H₂S, or NH₃ see (11). — For study of influence of \tilde{C} upon inflammability of mixts. of air with CH₄ (25) (10) (26) (27), with CO (10) (28), with H₂ (10), or acetylene (10) see indic. refs.]

Binary systems contg. \bar{C} . [System $\bar{C}+CCl_4$: for f.p./compn. data see (18); for n_D^{25} /compn. and use in anal. of the system see (22); for vap. press. and liq./vapor compn. of system see (29). — System $\bar{C}+1,1,2,2$ -tetrachloroethane (3:5750): for f.p./compn. data see (17). — System $\bar{C}+p$ pentachloroethane (3:5880): for f.p./compn. data (eutectic, f.p. -54.8° contg. 58.4 wt. % \bar{C}) see (18). — System $\bar{C}+i$ sopropyl alc. (1:6135); for D_{23}^{25} /compn. and n_D^{25} /compn. data see (30).]

Č forms binary azeotropes with many alcohols [e.g., \bar{C} with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 63.75° at 760 mm., contg. 36.5 wt. % \bar{C} (3); \bar{C} with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 76.75° at 760 mm., contg. 37 wt. % \bar{C} (3); \bar{C} with n-propyl alc. (1:6150) forms a const.-boilg. mixt., b.p. 94.05° at 760 mm., contg. 52 wt. % \bar{C} (31); \bar{C} with isopropyl alc. (1:6135) forms a const.-boilg. mixt., b.p. 81.7° at 760 mm., contg. 30 wt. % \bar{C} (31); \bar{C} with n-butyl alc. (1:6180) forms a const.-boilg. mixt., b.p. 108.95° at 760 mm., contg. 71 wt. % \bar{C} (3); \bar{C} with isoamyl alc. (1:6200) forms a const.-boilg. mixt., b.p. 116.1° at 760 mm., contg. 80 wt. % \bar{C} (31); \bar{C} with ethylene glycol (1:6465) forms a const.-boilg. mixt., b.p. 119.1° at 760 mm., contg. 94 wt. % \bar{C}].

 $\bar{\mathbf{C}}$ forms binary azeotropes with many other org. cpds. [e.g., $\bar{\mathbf{C}}$ with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 88.15° at 760 mm., contg. 50 wt. % $\bar{\mathbf{C}}$ (32); $\bar{\mathbf{C}}$ with \mathbf{AcOH} (1:1010) forms a const.-boilg. mixt., b.p. 107.35° at 760 mm., contg. 61.5 wt. % $\bar{\mathbf{C}}$ (218); $\bar{\mathbf{C}}$ with propionic acid (1:1025) forms a const.-boilg. mixt., b.p. 119.15° at 760 mm., contg. 91.5 wt. % $\bar{\mathbf{C}}$ (4); $\bar{\mathbf{C}}$ with isobutyric acid (1:1030) forms a const.-boilg. mixt., b.p. 120.5°, contg. 97 wt. % $\bar{\mathbf{C}}$ (33)].

Uses of \bar{C} . \bar{C} because of its solvent properties, b.p., uninflammability, and immiscibility with aq., etc., finds wide use. — [Other examples of its utility include the following: for use as dry-cleaning solvent see (34), cf. (35) (36) (222); for use with lower aliph. alcs. as solv. for cellulose ethers see (37); for use in dewaxing of lubricating oil see (38); for use in liq. HCN to diminish inflammability and explosiveness see (39); for use as a component of comml. tear-gas mixts. see (40).]

[For study of use of \bar{C} as an anesthetic (41), as fumigation agt. (with CCl₄) for grain or flour (42), for sterilization of surgical catgut (43), of antiseptic action (compared with CHCl₃ (44)) (45) see indic. refs.]

[For examples of studies of use of \bar{C} as anthelmintic especially with reference to hookworm and similar parasites see (46)–(57) incl.; for comparison of anthelmintic action of \bar{C} with that of CCl₄ (58) (59) or of chenopodium oil (60) see indic. refs.; for patent prepn. of \bar{C} for use as anthelmintic see (61).] (For toxicity see below.)

[For use of \bar{C} as the "booster" liquid in detn. of aq. by distn. especially in molasses and other sugar industry products see (62) (63) (64) (65) (66) (67). — For use of \bar{C} in prepn. of anhydrous Na₂O₂ by removal of moisture by distn. see (68).]

[For brief general surveys of \bar{C} see (69) (70).]

Physiological actn. and/or toxicity of C. [For studies from various viewpoints on toxicity of C see (57), (71)-(82) incl., also especially (219) (220) (224).]

Determination of C. C is usually detd. by some form of deen. followed by volumetric or gravimetric detn. of resultant chloride ion [e.g., for methods involving deen. of C with Na + AmOH in xylene (83) (84), with Na + ethanolamine in dioxane soln. (85) (223), or with Na in liq. NH₃ (86) (note that some cyanide forms. occurs) see indic. refs.; for methods involving thermal deen. see (87) (215)].

[For detn. of \tilde{C} by means of a recording ultra-violet photometer (the R. + H. Tri-Per Analyzer) see (88).]

PREPARATION OF C

From various polychloroethanes or polychloroethylenes. [For prepn. of $\bar{\mathbb{C}}$ from hexachloroethane (3:4835) by pyrolysis at 565° (89–94% conversion (89)), by passing over porcelain chips in hot tube (90) (note that CCl₄ (3:5100) is also formed), or by passing with H_2 over Ni at 270° (91) see indic. refs.; for prepn. of $\bar{\mathbb{C}}$ from hexachloroethane (3:4835) by treatment with granulated Zn in boilg. alc. (7), with Zn + dil. H_2 SO₄ at room temp. for several days (100% yield (5)) (92) (116), or even with Zn + aq. above 80° (93), with alc. KSH (94), with molecular Ag at 280° in s.t. (95), with SbF₃ at 300–325° under press. (96), with acetylene over activated carbon at 200–400° (97) cf. (123), with aniline at 170° at ord. press. (7), with N/10 abs. EtOH/NaOH at 25° (216), or with alc. free NaOEt in ether under press. at 140° (217) see indic. refs.]

[For prepn. of \tilde{C} from pentachloroethane (3:5880) by elimination of 1 HCl in various ways: e.g., by passing over bone char at 280° (98), or over N₁Cl₂ at 330° (99), by htg. with AlCl₃ at 70-100° (100% yield (101)) (100) or under reflux (102), with liq. NH₃ at -18 to -34° under reduced press. (103) (104), with MeOH over Al₂O₃ at 290° (MeCl (3:7005) is also formed) (105), with acetylene over cat. at 200-300° (vinyl chloride (3:7010) is also formed) (106), with alc. KOH (107) (108), or in alc. with 2 N aq. NaOH in cold (98% yield) (109) see indic. refs.]

[For prepn. of C from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) (see also below under prepn. of C from acetylene) on pyrolysis at 700° (110), with air over pumice + CuCl₂ at 430-450° (111), or with Cl₂ over activated carbon contg. 30% CuCl₂ at 300-320° (112) see indic. refs.]

[For prepn. of \tilde{C} from 1,2-dichloroethane (ethylene dichloride) (3:5130) with Cl_2 over cat. at 300-500° see (113); from ethane or its chloro derivs. with Cl_2 + fused metal chlorides such as $AlCl_3$, etc., at 250-500° see (114).]

[For formn. of \tilde{C} from trichloroethylene (3:5170) on pyrolysis at 700° (110) or with anhyd. FeCl₃ on htg. see (115).]

From various polychloromethanes. [For prepn. of \tilde{C} from CCl₄ (3:5100) through tube at 1300-1400° see (116) (117); for formn. of \tilde{C} (together with other prods.) from CCl₄ + H₂ through hot tube over pumice at low red heat (118) or through tube at 600-650° (119), or in dark electric discharge (120), see indic. refs. — Note also that \tilde{C} has been found (121) as a by-prod. of prepn. of CCl₄ (3:5100) by actn. of Cl₂ on CS₂.]

[For form. of C from CHCl₃ (3:5050) + H_2 in dark electric discharge see (120).]

From acetylene with Cl_2 (see also above under prepn. of \bar{C} from 1,1,2,2-tetrachloroethane (acetylene tetrachloride)). [For prepn. of \bar{C} from acetylene with Cl_2 + inert gas over cat. at 250-400° see (122) (123) (124) (125); from acetylene with Cl_2 at 700-900° in absence of extraneous substances (126); from acetylene with Cl_2 see (127) (128); from acetylene with Cl_2 in halogenated solv. at 175-260° + AlCl₃, etc., see (129).]

From miscellaneous sources. [For prepn. of \bar{C} from CO + HCl over cat. at 230-240° under high press. (CHCl₃ is also formed) see (130); from unsym.-heptachloropropane (3:0200) by dissociation into \bar{C} + CHCl₃ over Cu₂Cl₂ at 250° see (131); from chloral (3:5210) by long boilg, with AlCl₃ see (132) cf. (133) (134); from tetrachloroethyl chloro-

formate with AlCl₃ see (135); from trichloroacetic acid (3:1150) over ThO₂ + kaolin at 230-250° see (136); from pentachloropropionic acid (3:4895) on htg. in aq. (137), or from its ferric salt in light (139) cf. (140), or from pentachloropropionyl chloride (3:0470) with AlCl₃ (1 mole) at 60° (138) see indic. refs.]

PURIFICATION OF C

Comml. \bar{C} conts. some impurity which readily chlorinates (15); note also that \bar{C} , especially if exposed to light and air, may contain phosgene (3:5000), trichloroacetyl chloride (3:5420), trichloroacetic acid (3·1150), and other prods.; cf. below under oxidation of \bar{C} . — [For purification of \bar{C} by treatment with Cl_2 followed by illumination (15), by treatment with aq. alk. at elev. temp. (for removal of 1,1,2-trichloroethane (3:5330) or 1,1,1,2-trichloroethane (3:5555)) (141), by refluxing with finely divided metals + dil. acid (142) or with 1% Al or AlCl₃ (143), or by passing vapor over kaolin at 250° (144), see indic. refs.]

STABILIZATION OF C

To increase the resistance of $\bar{\mathbf{C}}$ to photooxidation (see below) and other changes, the addition of very small amts. of various stabilizers has been recommended. — [For example, for study of control of photooxidation of $\bar{\mathbf{C}}$ by use of inhibitors such as thymol (1:1430), ether, alcohol, thiourea, etc., see (145). — For stabilization of $\bar{\mathbf{C}}$ by addn. of small amts. of paraffin hydrocarbons (e.g., gasoline) (146), various phenols (such as hydroquinone monomethyl or monobenzyl ether) (147), oil-sol. azo dyes contg. phenolic groups (148), mercaptans (such as n-butyl mercaptan) (149), various org. tertiary amines such as triethylamine (150) or picoline (151), various phenols, amines, and aminophenols (152), or a wide variety of org. N cpds. (221) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis. [\check{C} on pyrolysis over heated Pt wire gives (153) (154) hexachloroethane (3:4835) + hexachlorobenzene (3:4939) + Cl₂.]

Hydrogenation. [Note that \bar{C} does not add H_2 even in pres. of Ni at 300-350° (99); \bar{C} with excess H_2 over Ni at 220° dec. (163) to carbon + HCl.]

Oxidation. \bar{C} can be oxidized especially in the presence of light and moisture giving according to conditions truchloroacetyl chloride (3:5420), phosgene (3:5000), trichloroacetic acid (3:1150), or various mixtures of these prods.; for inhibition of this oxidation see above under stabilization of \bar{C}

[For extensive studies of photochem. oxidn. of $\bar{\rm C}$ giving 87% trichloroacetyl chloride accompanied by phosgene see (15) (155) (156); for oxidn. of $\bar{\rm C}$ on stdg. with aq. in light for 4 months yielding trichloroacetic acid see (157) cf. (158); for oxidn. of $\bar{\rm C}$ to trichloroacetyl chloride with O₃ (159) (160), with peracetic acid (acetyl hydrogen peroxide) (161), with conc. HNO₃ + conc. H₂SO₄ in freezing mixt. (162), with SO₃ at 150° (164), or with N₂O₅ (194) see indic. refs.; for patents on photochem. oxidn. of $\bar{\rm C}$ to trichloroacetyl chloride (3:5420) see (165) (166).]

[\bar{C} on oxidn. with $K_2Cr_2O_7/H_2SO_4$ is completely converted to $CO_2 + H_2O + HCl$ (167); \bar{C} passed with air over CuO at 450° gives only traces (168) of phosgene.]

Reaction with halogens. [\bar{C} dislyd. in dichlorodifluoromethane ("Freon") with F₂ at -80° (169), or \bar{C} with F₂ at 0° directly (170) but not in CCl₄ soln. (169) cf. (172), or \bar{C} in vapor phase at 130° with F₂ diluted with N₂ (171), gives (20% yield (171)) 1,2-difluoro-1,1,2,2-tetrachloroethane, m.p. 26.5° (96) (169), accompanied by various other prods. such as fluoropentachloroethane, m.p. 99.0-99.5° (in s.t.), b.p. 136-138° (170), and 1,4-difluoro-octachlorobutane (170) (169), m.p. 4-5° (170), b.p. 152.2° at 20 mm., $D_4^{20} = 1.9272$, $n_D^{20} = 1.5256$ (170).]

[Č with dry Cl₂ in direct sunlight (90), or Č in CCl₄ at 22° (173) or in vapor phase at 40° and low press. (155) in light and absence of O₂, or Č with SO₂Cl₂ in pres. of dibenzoyl peroxide (174) adds Cl₂ yielding hexachloroethane (3:4835) q.v.; note, however, that Č + Cl₂ + light in pres. of O₂ undergoes photooxidation to trichloroacetyl chloride (see above under oxidation of Č). — Č with Cl₂ at 700–800° (175), or Č with Cl₂ over act. carbon at 600–650° (176), undergoes cleavage of C—C bond yielding CCl₄ (3:5100); for study of this reactn. see (177).]

[Č with Br₂ in sunlight adds 1 mole Br₂ yielding (178) (179) (110) 1,2-dibromo-1,1,2,2-tetrachloroethane, m.p. 197.5° dec. (in s. cap. tube) (180), 200-205° dec. (110), 190° dec. (138). — Note, however, that this photochem. addn. is inhibited by its reactn. prod. (181), that, although accelerated by *small* amts. O₂, pres. of large amts. O₂ lead to a halogen catalyzed photooxidation (181), that in CCl₄ soln. resultant equilibrium mixt. conts. only 30% addn. prod. (182). — For extensive study of this reactn. see (181); for studies of its rate see (183) (184); for extensive study of photochem. dissoc. of prod. see (179). — For study of reactn. of C with radio-bromine see (185).]

[\bar{C} does not add I_2 . — For soly. of I_2 in \bar{C} see (186); for use of such solns. in detn. of iodine number of unsatd. oils and fats see (187) (188).]

Behavior of \tilde{C} with other inorganic materials. [\tilde{C} with Cl_2O in CCl_4 at -20° gives (189) hexachloroethane (3:4835).]

[\overline{C} with NO₂ in s.t. at 100–120° for 3 hrs. (190), or at 100–110° for 3 hrs. (5), or at 80° for 3 hrs. or 60° for 6 hrs. (191), or at 10–12 atm. press. at 60–80° for 3–6 hrs. (191), or \overline{C} with fumg. HNO₃ at ord. temp. stood several days (5) cf. (192), adds 2 moles NO₂ yielding 1,2-dinitro-1,1,2,2-tetrachloroethane [Beil. I-102, I₁-(33)], cryst. from alc., m.p. 142–143° (s. cap. tube) (5).]

[Č with nitryl chloride (ClNO₂) yields (193) 1-nitro-1,1,2,2,2-pentachloroethane, lfts. from alc., m.p. 192° (s. cap. tube) (193).]

[\bar{C} with N₂O₅ undergoes vigorous oxidn. (presumably to trichloroacetyl chloride) (194).] [\bar{C} with NH₃ at 700-800° splits off all its halogen as NH₄Cl (195) cf. (196).]

[For behavior of \bar{C} with various common metals see (197); note that \bar{C} is not attacked by molecular Ag even at 300° (95); note that \bar{C} with Na or K or their mixture may (like many other polychloro compds.) explode under certain conditions (for an extensive study see (198)).]

Behavior of \bar{C} with organic reactants. [\bar{C} (1 mole) with CHCl₃ (2 moles) + AlCl₃ (0.2 mole) refluxed 15-20 hrs. gives (85-93% yield (199)) (101) (16) (200) (201) (202) (214) unsym.-heptachloropropane (3:0200); for study of equilibrium of system \bar{C} + CHCl₃ + unsym.-heptachloropropane see (131).]

[$\ddot{\mathbf{C}}$ with 1,1,2,3,3-pentachloropropene-1 (3:6075) + AlCl₃ gives (201) cf. (214) 1,1,3,4,5,-5,6,6,6-nonachloropentene-1.]

[\bar{C} with NaOEt at 100-120° yields (203) ethyl dichloroacetate (3:5850) + Na diethoxyacetate + other prods., presumably via ethyl α,β,β -trichlorovinyl ether, α,α -dichloro- β,β -diethoxyethylene, triethyl dichloroorthoacetate, etc., cf. (204).]

[Č (1 mole) with NaSC₆H₅ (2 moles) in alc., refluxed 48 hrs., gives (yield not stated (205)) α,β -dichloro- α,β -bis-(thiophenyl)ethylene, ndls. from alc., m.p. 71-72° (205). — Č with disodium salt of dithiopyrocatechol in alc. at 110-120° in s.t. for 7 hrs. gives small

yield (206) of
$$C_6H_4$$
 C=C C_6H_4 , golden ndls., m.p. 234° (206).]

[Č with paraformaldehyde (1:0080) + conc. H₂SO₄ as directed (207) gives α,α -dichloro- β -hydroxypropionic acid, m.p. 88–89° (s. cap. tube).]

[C with dibenzoyl peroxide on refluxing either with or without AlCl₃ gives (40% yield

(208)) α,α,β -trichloro- β -phenylethylene (α,α,β -trichlorostyrene) [Beil. V-477, V₂-(367)], b.p. 87-89° at 3 mm., $D_{-}^{25} = 1.40$, $n_{D}^{25} = 1.5758$ (208), accompanied by chlorobenzene (3:7903), CO₂, and under certain conditions by hexachloroethane (3:4835).]

[Č with large excess EtMgBr in boilg. ether evolves ethylene and on subsequent treatment with aq. gives a mixt. of ethylene + acetylene; for explanation see (209). — Č with *n*-butyllithium in pet. eth. gives violent explosion (210).]

[For study of reactn. of C with pyridine or piperidine at 16-18° see (211).]

- ② Color test with NH₄OH/Cu₂Cl₂: C

 (1-2 drops) in small glass-stoppered bottle filled with conc. aq. NH₄OH, treated with powdered Cu₂Cl₂, stopper quickly inserted (to force out air and excess liquid), shaken, and allowed to stand, gives in 3 days a pale amethyst color (212); note, however, that C

 on stdg. with metallic Cu + conc. aq. NH₄OH develops rich port-wine red color in aq. layer and brown coating on the copper (213). Note also that neither of these tests should be regarded as conclusive (see (212) (213)).

CHAPTER XIII

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 1. D_4^{20} greater than 1.1500

(3:5500-3:5999)

3:5500 cis-2,3-DICHLOROBUTENE-2 Cl Cl
$$C_4H_6Cl_2$$
 Beil. S.N. 11 CH_3-C-CH_3

B.P. 124-126° at 758 mm. (1) $D_4^{20} = 1.1618$ (1) $n_D^{20} = 1.4590$ (1) $D_4^{18} = 1.1620$ (1) $n_C^{18} = 1.4616$ (1)

[See also trans stereoisomer (3:7395).]

[For prepn. of \bar{C} (accompanied by its *trans* stereoisomer (3:7395)) from 2,2,3-trichlorobutane (3:5680) with solid KOH (1 mole) at 135-140° see (1).]

C on oxidn. with 3% aq. KMnO₄ yields (1) acetic acid (1:1010).

 \bar{C} in CCl₄ at -20° treated with 7% O₃, then hydrolyzed, yields (1) acetic acid (1:1010) + acetaldehyde (1:0100).

3:5500 (1) Tishchenko, Churbakov, J. Gen. Chem. (U.S.S.R.) 6, 1553-1558 (1936); Cent. 1937, I 3785; C.A. 31, 2165 (1937).

B.P.			M.P.			•	
127.5-128°	(1) cor.	(2)	-57°	$D_{21}^{21}=1.632$	2 (7)	$n_{\rm D}^{26} = 1.456$	(1)
127°	at 760 mm.	(3)					
126-127°	at 745 mm.	(4)		$D_{15}^{15} = 1.658$	5 (3)	$n_{\rm D}^{22} = 1.45664$	(8)
		(5)					
127.2°	at 725 mm.	(6)					
49°	at 50 mm.	(3)					
45°	at 26 mm.	(7)					
20°	at 10.3 mm.	(1)					
0°	at 2-4 mm.	(1)					

Colorless oily liq. with irritating and suffocating odor, but (when pure) not especially lachrymatory. — Ord. samples may cont. triphosgene (3:1915).

[For prepn. from methyl formate (1:1000) or methyl chloroformate (3:5075) by chlorination see (8) (3) (9) (2) (1); for prepn. from bis-(trichloromethyl) carbonate (triphosgene) (3:1915) see (1); for German prepn. in World War I see (10).]

 \bar{C} (when pure) boils with no decompn. (1); however, above 300° (2) or on contact with activated carbon, charcoal, or iron oxide at ord. temp. (1) \bar{C} decomposes to phospene

(3:5000). — C on contact with alumina (1), AlCl₃ (5), or FeCl₃ (3) decomposes in a different mode yielding CCl_4 (3:5100) + CO_2 .

 $\bar{ extsf{C}}$ with aq. hydrolyzes slowly in the cold but rapidly at 100° yielding only HCl + CO₂

(1) (3); C on warming with aq. Na₂CO₃ yields NaCl + CO₂ (3).

C on treatment at 20° for 5 min. with NaI in acctone evolves CO and separates I2 to 98.8% of amt. expressed by reaction: $Cl_3C.O.CO.Cl + 2NaI \rightarrow 2CO + 4NaCl + I_2$ (11) [cf. chloromethyl chloroformate (3:5275), dichloromethyl chloroformate (3:5315), and triphosgene (3:1915)].

 $\bar{\mathbf{C}}$ with aq. NH₄OH reacts vigorously yielding urea + NH₄Cl. $-\bar{\mathbf{C}}$ with excess aniline in either aq. or non.-aq. soln. is converted to N,N'-diphenylurea (carbanilide), m.p. 233°,+ aniline hydrochloride (3). [Note that with insufficient amline a mixt. of phenyl isocyanate + N-phenylcarbamyl chloride may form (3).]

Č on addn. in cold to conc. soln. of phenol (1 mole) in aq. NaOII separates an oil (which soon solidifies) of phenyl trichloromethyl carbonate [Beil. VI₁-(88)], ndls. from ether, m.p. 70.5° (12), 66° (3); this product upon warming with aq. sodium phenolate (or C warmed with excess sodium phenolate in one operation) yields diphenyl carbonate (1:2335), cryst. from alc., m.p. 78° (12). [For corresponding reactions with p-crossle (1:1410), β -naphthol (1:1540), p-chlorophenol (3:0475), and p-nitrophenol see (13).

 $\bar{\mathbf{C}}$ with pyridine yields a yel. double quaternary ammonium salt $C_5H_5N(Cl).CO(Cl)$ -

 $N.C_5H_5$ which by aq. is decomposed to pyridine hydrochloride $+ CO_2$ (14).

[For use of C in prepn. of acid chlorides of carboxylic or sulfonic acids see (15); similarly \tilde{C} htd. with anhydrous NaOAc gives $Ac_2O + NaCl + CO_2$ (2); for actn. on methyl hydrogen sulfate yielding methyl chlorosulfonate + phosgene + CO_2 see (16).]

[For use of C for introduction of a second—CO.Cl group into acid chlorides see (17).]

3:5540
$$\alpha,\beta$$
-Dichloro- α -ethoxyethylene) CH=CH—O—CH₂CH₃ I₁-(377) I₂-(780) Cl Cl Cl Cl D45-2 I₁-(377) I₂-(780) B.P. 128.2° cor. (1) $D_4^{25} = 1.1972$ (3) $D_4^{20} = 1.2037$ (3) $D_D^{20} = 1.2037$ (3) $D_D^{20} = 1.45584$ (3)

Č has the possibility of existing in two geometrically isomeric forms, but only this one has as yet been recognized.

[For prepn. of C from trichloroethylene (3:5170) with alc. KOH (4), with alc. NaOEt (yield: 81% (5), 70% (2)), or with alc. NaOH + CaO (6) see indic. refs.; from 1.1.1.2tetrachloroethane (3:5555) with NaOEt see (1).]

[C with calcd. amt. aq. (7), or with conc. HCl (8) yields ethyl chloroacetate (3:5700);

C on boilg. with aq. to complete soln. yields (9) chloroacetic acid (3:1370); C on htg. with aq. in s.t. at 180° yields (1) glycolic acid (1:0430), EtCl (3:7015) + HCl.]

[C with HCl gas yields (10) an addn. prod. which on htg. decomposes to chloroacetyl chloride (3:5235) + EtCl (3:7015); C with monobasic org. acids yields (2) on htg. ethyl chloroacetate (3:5700) + corresp. acid chloride; with succinic acid the products are (2) ethyl chloroacetate (3:5700) + succinic anhydride (1:0710).]

[\bar{C} with alcohols yields mainly (2) (11) the corresp. alkyl chloroacetate + EtCl (some ethyl chloroacetate + alkyl chloride are also formed (2)); \bar{C} htd. with excess NaOEt yields (1) sodium salt of ethoxyacetic acid (1:1070).]

 $[\bar{C}]$ with phenols yields exclusively (2) the corresp. aryl chloroacetate + EtCl; e.g., \bar{C} with β -naphthol (1:1540) yields (2) β -naphthyl chloroacetate, m.p. 95° (2).]

Č with aniline in aq. or aq. alc. soln. yields (12) ethyl N-phenylaminoacetate (90%) [Beil. XII-470, XII₁-(263)], m.p. 58°, and phenylaminoacetanilide (10%) [Beil. XII-556, XII₁-(285)], m.p. 112°.

[\tilde{C} readily absorbs Cl₂ at ord. temp.; if moisture is carefully excluded, the prod. breaks up (13) (14) on keeping or on htg. into dichloroacetyl chloride (3:5290) + EtCl (3:7015); if, however, moisture is given access or aq. added, then on keeping or htg. the prod. breaks up (13) (14) and on distn. gives alm. theoretical yield of ethyl dichloroacetate (3:5850) + HCl.]

[\bar{C} readily absorbs Br₂; with complete exclusion of aq. the products are (13) (14) bromochloro-acctyl chloride, b.p. 138–139° (13), and EtBr; in pres. of aq. the products are ethyl chloro-bromo-acctate, b.p. 174°, $D_4^{22}=1.5890$ (13), + HCl + HBr; some bromo-chloro-acctyl bromide, b.p. 158–160°, 47–49° at 15 mm. (15), and C₂H₅Cl (3:7015) are also (15) formed. — \bar{C} on treatment with Br₂ in the cold, then immediately followed by alc. KOH, gives good yield (3) of β -bromo- α , β -dichlorovinyl ethyl ether, b.p. 177° at 754 mm., $D_4^{20}=1.6565$, $n_3^{17}=1.50427$ (3).]

[C treated with ICl, stood 30 min. (17), filtered from I₂, then htd. to 50° to expel C₂H₆Cl gives (16) (17) chloro-iodo-acetyl chloride; addn. of aq. to latter yields by hydrolysis (16) (17) chloro-iodo-acetic acid, colorless lfts. from lt. pet., m.p. 90° (16).]

3:5550 1,3-DICHLOROBUTENE-2 Cl Cl C₄H₆Cl₂ Beil. S.N. 11 (2,4-Dichlorobutene-2)
$$CH_3-C=CH-CH_2$$

B.P. 127-129° at 756 mm. (1) $D_4^{20} = 1.1591$ (1) (3) $n_{\rm D}^{20} = 1.47239$ (1) 127-128.5° at 753 mm. (2) 1.1582 (2) 1.4695 (2) 61-63° at 70 mm. (1) 56-57° at 55 mm. (3) $n_{\rm C}^{20} = 1.46988$ (1) 53-54° at 55 mm. (2) 1.4694 (3) 53-54° at 50 mm. (1)

Colorless liq. with characteristic odor (1). — \tilde{C} is formed (5–10% (4) (5) (1)) cf. (10) in synthesis of chloroprene (3:7080). — [For use in mfg. of unsatd. cellulose ethers see (6); in mfg. of unsatd. ethers of alcohols and phenols for use as solvents, disinfectants, etc., see (7) (8).]

[For prepn. of \tilde{C} readily and in quantity (1) from vinylacetylene by shaking with an excess (4 moles) of HCl contg. CuCl see (1): from methyl vinyl ketone in 33% yield (together with other products) with PCl₅ at -10° see (2), from 2-chlorobutene-2 (3:7105) (together with other products) by actn. of Cl₂ at 350° see (9); for formn. of \tilde{C} (together with other products) from trimethylethylene + Cl₂ see (11).]

Č passed over silica gel or clay at 245-275° loses HCl yielding (4) 17-18% 3-chloro-butadiene-1.3 ("Chloroprene") (3:7080).

 \bar{C} on hydrolysis with steam (12), or aq. alk. (5) (12), or aq. K_2CO_3 (2), aq. Na_2CO_3 (70-80% yield (4)) or $CaCO_3$ (3) gives 3-chlorobuten-2-ol-1 (3:8207) q.v., b.p. 161-162°. — [Note that \bar{C} with alc. alk. does not hydrolyze or lose HCl but instead gives the corresp. ethers (see details under 3-chlorobuten-2-ol-1 (3:8207)).]

Č with Cl₂ yields (13) (14) (15) a mixt. of 2,3,4-trichlorobutene-1 (3:9064), 1,2,3,3-tetrachlorobutane (3:9080), and 1,2,2,3,4-pentachlorobutane (3:9070).

Colorless liq. — miscible with aq. (see also below) and most org. solv.

MISCELLANEOUS PHYSICAL PROPERTIES

BINARY SYSTEMS CONTAINING C

 \bar{C} + water. For values of D_4^{20} and n_D^{20} (also n_C^{20} , n_F^{20} , n_G^{20}) over whole range 0-100% \bar{C} see (6) cf. (22) (23); for thermal anal. of systems see (26). — For study of salting-out of \bar{C} from its aq. solns. (11) or its isolation by ether extraction of aq. solns. satd. with NaCl or Na₂CO₃ (27) see indic. refs. — For concn. of \bar{C} , i.e., dehydration of its aq. solns. by distn. of the water with C₆H₆ (28), with 1,2-dichloroethane (ethylene dichloride) (3:5130) (29), or with cyclohexanol (1:6415) (30) see indic. refs. — See also below under azeotropes.

Note that boilg. aq. solns. of Č undergo slow decompn., e.g., about 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11) (presumably by loss of HCl and evoln. of ethylene oxide (1:6105), b.p. 10.7°, and/or (38) acetaldehyde (1:0100), b.p. 20.2°.

 \ddot{C} with hydrocarbons. \ddot{C} with C_6H_6 (1:7400): for b.p., vapor-liq. equil., and n_D^{25} see (10). — \ddot{C} with toluene (1:7405): for b.p., vapor-liq. equil., and n_D^{25} see (10) (see also below under azeotropes).

 \bar{C} with alcohols. \bar{C} with butanol-1 (1:6180): for b.p., vapor-liq. equil., and n_D^{25} see (10). — \bar{C} with isobutyl alc. (1:6165): for b.p., vapor-liq. equil., and n_D^{25} see (10).

C with ethers. C with di-isopropyl ether (1:6125): for b.p., vapor-liq. equil., and

 $n_{\rm D}^{25}$ see (10). — \bar{C} with di-n-butyl ether (1:7950): for b.p., vapor-liq. equil., and $n_{\rm D}^{25}$ see (10). — \bar{C} with β,β' -dichloro-diethyl ether (3:6025): for b.p., vapor-liq. equil., and $n_{\rm D}^{25}$ see (10) (see below under azeotropes).

 $\tilde{\mathbf{C}}$ with chlorinated hydrocarbons. $\tilde{\mathbf{C}}$ with 1,2-dichloroethane (ethylene dichloride (3:5130): for b.p., vapor-liq. equil., and D see (31) (see also below under azeotropes). (For use of ethylene dichloride in dehydration of $\tilde{\mathbf{C}}$ see (30).)

AZEOTROPES CONTAINING C

Binary azeotropes. \bar{C} with water forms a const.-boilg. mixt., b.p. 97.85° at 760 mm. (26) (8), 97.8° at 760 mm. (23) (32), contg. 45.8 wt. % (8), 43.5 wt. % = 14.7 mole % (32) \bar{C} : constants for this azeotropic mixt. at other press. include the following: at 771 mm., b.p. 96-96.2° (26); at 735 mm., b.p. = 95.8° (33) (11), contg. 42.5 wt. % \bar{C} (33) (11); at 504 mm., b.p. = 86.4° (23); at 400 mm., b.p. = 80.55°, contg. 40.5 wt. % \bar{C} (23). — Note that compn. changes only slightly (23) with press. — For study of influence of NaCl (11) (23) or of HCl (11) see indic. refs.

 $\bar{\mathbf{C}}$ with toluene (1:7405) gives a const.-boilg. mixt., b.p. 106.9°, contg. 27 mole % $\bar{\mathbf{C}}$ (10). — $\bar{\mathbf{C}}$ with di-n-butyl ether (1:7950) gives a const.-boilg. mixt., b.p. 123.0°, contg. 68 mole % $\bar{\mathbf{C}}$ (10). — $\bar{\mathbf{C}}$ with β,β' -dichlorodiethyl ether (3:6025) gives a const.-boilg. mixt., b.p. 128.2°, contg. 91.8 mole % $\bar{\mathbf{C}}$ (10).

Ternary azeotropes: \bar{C} with aq. + C_6H_6 (1:7400) gives a const.-boilg. mixt., b.p. 67.0-67.3° (29). - \bar{C} with aq. + ethylene dichloride (3:5130) gives a const.-boilg. mixt., b.p. 69.6° (29). - \bar{C} with aq. + 1,1,2-trichloroethylene (3:5170) gives a const.-boilg. mixt., b.p. 70.8-71.5° (29).

MISCELLANEOUS PHYSICAL PROPERTIES OF C

[For sepn. of \bar{C} from gas mixts. by adsorption (?) on $Mg(ClO_4)_2$ or other perchlorates see (34).]

USES OF C

The manifold uses of \bar{C} , based upon both its physical and its chemical characteristics, cannot here be reviewed in detail; however, some examples include the following.

[For use in sepn. of butadiene from hydrocarbon mixts. (35), in dewaxing and removing naphthenes from mineral lubricating oils (36), in refining of rosin (37), in extraction of pine lignin (38) (39), as solv. for various resins (40), as solv. for cellulose acetate (41) or cellulose ethers (42), for addn. to rayon spinning baths (43) see indic. refs.]

PHYSIOLOGICAL AND BIOCHEM. BEHAVIOR OF C

[For study of pharmacol. of \bar{C} (or its phosphoric esters, etc.) see (44); for reports of poisoning by \bar{C} see (45) (46); for study of toxicity of vapor of \bar{C} see (403).]

[For effect of \bar{C} upon amylase (47) (48) or lipase (49) see indic. refs.; for use of \bar{C} in prod. of yeast of depressed enzymatic activity see (50).]

DETERMINATION OF C

[For colorimetric detn. of \tilde{C} by reactn. with diazotized sulfanilic acid in alk. soln. at 25° see (106) (note that method involves oxidn. of \tilde{C} by the reagt. to chloroacetaldehyde (3:7212) and color formn. with latter); for detn. of \tilde{C} in aq. solns. by refractometry see (11) (25) (6) (23).]

PREPARATION OF C

From ethylene. With hypochlorous acid, e.g., from $Cl_2 + aq$. $-\bar{C}$ is usually prepd. from ethylene by addn. of HOCl, the HOCl may be obtained by use of $Cl_2 + aq$. (sometimes in the pres. of alk. acceptors for the simultaneously formed HCl), by use of organic hypochlorites, or other org. cpds. which hydrolyze to give HOCl.

[For scientific papers discussing prepn. of \tilde{C} from ethylene + HOCl (Cl₂ + aq.) see (401) (11) (51) (52) (53) (54) (55) (56) (57) (58) (59); for very old work see (60); for examples of patents employing this method see citations (61)-(82) cf. (402), inclusive; for study of metal-corrosion problems involved in this method of prepn. of \tilde{C} see (83).]

With organic hypochlorites (e.g., ter-butyl hypochlorite (3:7165)). [For patents on prepn. of \bar{C} from ethylene + ter-butyl hypochlorite see (84) (85).]

With N-chlorourea. [For prepn. of \bar{C} from ethylene with N-chlorourea in 5% H₂SO₄ contg. CuCl₂ at 0° (yield: 60-70% \bar{C} accompanied by 2% ethylene dichloride (3:5130)) see (86).]

From ethylene glycol (1:6465). [For prepn. of \tilde{C} from ethylene glycol satd. with HCl gas and htd. in s.t. (12) (90), or treated at 160° (87) (4) or 180° (88) with stream of HCl (yields: 70-80% (88), 60% (87)), see indic. refs.; note that ethylene glycol with excess conc. HCl in s.t. at 100° gives no \tilde{C} (89) but only ethylene dichloride (3:5130), while mere distn. with conc. HCl (9 moles) gives (15) only 12% \tilde{C} .)]

[For prepn. of \bar{C} from ethylene glycol with S_2Cl_2 (2.5 wt. pts. (91)) on refluxing (yields: 82.5% (92), 72.8% (91)) (93) (94) (95) see indic. refs.: for forms. of \bar{C} from glycol with SiCl₄ see (96).]

From ethylene glycol esters. [For patents on prepn. of \tilde{C} from ethylene glycol diformate (1:3402) with HCl gas at 100° via formn. of β -chloroethyl formate and subsequent alcoholysis of latter with MeOH/HCl (97), or from ethylene glycol diacetate (1:3511) with EtOH + HCl at 125–135° under press. (EtOAc is also formed) (98), see indic. refs.]

From ethylene oxide (1:6105). [For formn of \bar{C} from ethylene oxide with liq. HCl (99) or with S_2Cl_2 (100) (other prods. are also formed) see indic. refs.]

From other miscellaneous sources. [For formn. of \tilde{C} from 1,2-dichloroethane (ethylene dichloride) (3:5130) by conversion with SO₃ below 45° to β -chloroethyl chlorosulfonate (see below) and subsequent hydrolysis to \tilde{C} (101); from bis-(β -chloroethyl) sulfate (see below) by refluxing with aq. (102); from β -chloroethyl trichloroacetate (3:6410) by shaking with aq. (103); from β -chloroethyl vinyl ether (3:7464) on distn. with aq. + trace of HCl (acetaldehyde is also formed) (104); from chloroacetaldehyde (3:7212) by reduction of carbonyl group with EtOMgBr (105) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of \bar{C} . $[\bar{C}$ in s.t. at 184° for 10 hrs. yields (107) 1,2-dichloroethane (ethylene dichloride) (3:5130) and acetaldehyde (1:0100) (the latter partially as aldehyde resin); for study of rate of decompn. of \bar{C} at 368° see (108).]

BEHAVIOR WITH INORGANIC REACTANTS

Reduction of C. [C with Na/Hg + aq. (109), or C in aq. soln. in pres. of alk. with H₂ at atm. press. + cat. (110), yields ethyl alcohol (1:6130); in latter method reduction is facilitated by NaOH, less so by Ca(OH)₂ or CaCO₃; using Pd/CaCO₃ yield of EtOH is 91%; using Ni yield of EtOH is 80% accompanied by 20% ethylene glycol (1:6465) (110).]

Oxidation of C. C on oxidn. with CrO₃ yields (111) chloroacetic acid (3:1370).

Behavior with H_2O . \tilde{C} on boilg. with aq. undergoes gradual decomposition: e.g., 10% in 8 hrs. (23), 50% in 5 hrs. (107) cf. (11), presumably by loss of HCl and formation of ethylene oxide (1:6105), acetaldehyde (1:0100) etc. — [Note that \tilde{C} with aq. vapor over $ZnCl_2 + ZnO$ at $250-255^\circ$ yields (112) acetaldehyde (1:0100).]

Behavior with inorganic acids. (See also below under behavior with salts of inorganic acids.)

With H_2SO_4 . \bar{C} with conc. H_2SO_4 readily dissolves and according to conditions yields either β -chloroethyl hydrogen sulfate or bis- $(\beta$ -chloroethyl) ether. (Note that \bar{C} with SO_2Cl_2 (see below) gives bis- $(\beta$ -chloroethyl) sulfate.)

[For study of rate and extent of formn. of β -chloroethyl HSO₄ with conc. or fumg. H₂SO₄ at 25° see (14); for reactn. of barium salt of this prod. with aniline see (113).]

 $\ddot{\mathbf{C}}$ with conc. $\mathrm{H}_2\mathrm{SO}_4$ (17% by wt. of $\ddot{\mathbf{C}}$) refluxed 6 hrs. gives (114) bis-(β -chloroethyl) ether (3:6025).

With HNO_3 . [\bar{C} with HNO_3/H_2SO_4 (115) (116) gives (92% yield (115)) β -chloroethyl nitrate, $ClCH_2CH_2ONO_2$, b.p. $149-150^\circ$; for use of this prod. in explosives see (115) (117); for use as ignition accelerator in Diesel engine fuels see (118) (119) (120).]

With HNO_2 . [C with HNO_2 (from $NaNO_2 + HCl$) at -5° gives (70% yield (121)) (122) (123) β -chloroethyl nitrite $ClCH_2CH_2ONO$, b.p. 90-91° (121), 89-89.5° (122), $D_2^{20} = 1.212$ (122), $n_D^{20} = 1.4125$ (122). (This prod. is not to be confused with the isomeric chloro-nitro-ethanes Beil. I-101.)]

Behavior with salts of inorganic acids. (For behavior with NaCN, anhyd. Na₂CO₃, NaSCN, etc., see further below under organic reactants; for behavior with NaSH see further below under alkali reactants.)

With alkali iodides. \bar{C} with NaI in hot alc. (124) (125) or boiling acetone (126) for 16 hrs. (127) (better 4 hrs. (20)), or with KI in alc. at room temp. for 24 hrs. (128) gives (95% yield (127)) β -iodoethanol (ethylene glycol iodohydrin), b.p. 176-177° dec. (124), 86-87° at 25 mm. (20), 85-88° at 25 mm. (127), 85° at 25 mm. (124), 61° at 7 mm. (4), $D_{4}^{20} = 2.1968$ (4), $n_{D}^{20} = 1.57134$ (24). [For study of rate of reaction of \bar{C} with KI in dry acetone at 50° and 60° see (16).]

With alkali sulfides (for alkali sulfhydrates, e.g., NaSH, see below). — $[\bar{C}$ with aq. K₂S (129) or with aq. Na₂S (11) (130) (131) (132) at 30–35° for 1 hr. (33) splits out 2 NaCl giving (yields: 90–95% (11), 79–86% (33)) bis-(β-hydroxyethyl) sulfide ("thiodiglycol") [Beil. I-470, I₁-(244), I₂-(525)], b.p. 164–166° at 20 mm. (33), 130° at 2 mm. (131), 104° at 0.005 mm. (132), f.p. = -16° (132), $D_2^{20} = 1.1821$ (132), 1.1819 (132), $n_D^{20} = 1.52031$ (132), misc. with aq., readily sol. alc., acetone, EtOAc, or CHCl₃, but spar. sol. ether, C₆H₆, or CCl₄ (131) (corresp. dibenzoate, m.p. 65° (133), di-(p-nitrobenzoate), m.p. 107.7° (134), bis-(N-phenylcarbamate), m.p. 128.5–129.5° (131)). — Note that this prod. ("thiodiglycol") with \bar{C} at 100° for 13 hrs. (131) adds to form tris-(β-hydroxyethyl)sulfonium chloride (HOCH₂CH₂)₃SCl, non-hygroscopic ndls., m.p. 126–127° (132), 125–126° (131). Note also that \bar{C} (1 mole) + Na₂S + 1-chloropropanol-2 (propylene chlorohydrin) (3:7747) yields (135) a mixed deriv., viz., β-hydroxyethyl β-hydroxy-n-propyl sulfide.]

With alkali selenide. [\bar{C} with aq. Na₂Se yields (136) bis-(β -hydroxyethyl) selenide.]

With alkali disulfide. [Č with aq. Na₂S + S gives (46% yield (137)) (138) bis-(β -hydroxyethyl) disulfide [Beil. I-471, I₂-(528)], b.p. 155° at 30 mm., $D_4^{20} = 1.3375$ (137).]

With NaHSO₃. [C with solid NaHSO₃ in s.t. at 170-180° for several hrs. gives (139) the salt of 2-hydroxyethanesulfonic acid-1 ("isethionic acid").]

With Na_3PO_4 . [Č with satd. aq. Na_4PO_4 as directed (140) cf. (3) gives (30% yield (140)) di-sodium β -hydroxyethyl phosphate, cryst. from aq. alc. as hexahydrate, m.p. 61° (140).]

With Na₂AsO₃. [\bar{C} with aq. alk. Na₃AsO₃ (from As₂O₃ in aq. alk.) as directed (141) (142) (143) cf. (144) (145) gives β -hydroxyethylarsonic acid (also known as β -hydroxyethylarsinic acid) = HOCH₂CH₂AsO(OH)₂, very sol. aq. but forming spar. sol. monohydrated calcium salt (141).]

With Na_2SnO_2 . [Č with aq. alk. Na_2SnO_2 (from $SnCl_2 + aq$. NaOH) gives (146) salt of β -hydroxyethylstannonic acid = $HOCH_2CH_2.SnO(OH)$.]

Behavior with acid halides of inorganic acids. With thionyl chloride (SOCl₂). [Č with SOCl₂ (small excess) in cold gives (83% yield (147)) β -chloroethylsulfinyl chloride = ClCH₂CH₂OS(O)Cl, b.p. 93-95° at 40 mm., 84-85° at 20 mm., $D_4^{20} = 1.5010$, which upon attempted distn. at ord. press. dec. into SO₂ + ethylene (di)chloride (3:5130) (147). — However, Č (excess) with SOCl₂ at elevated temp. (147) or Č (1 mole) with SOCl₂ (1 mole) in cold (148) gives (75% yield (148)) cf. (156) bis- (β -chloroethyl) sulfite = (ClCH₂CH₂O)₂SO, b.p. 133° at 12 mm. (148), 117.5-118° at 4 mm. (147), $D_0^{20} = 1.422$, $n_0^{20} = 1.481$ (148).]

With sulfuryl chloride (SO_2Cl_2). [Č with SO_2Cl_2 in cold gives (149) (70% yield (122)) β -chloroethyl chlorosulfonate = ClCH₂CH₂O.SO₂Cl [Beil. I₂-(336)], b.p. 101° at 23 mm., $D_-^{20.5} = 1.552$, $n_D^{18.3} = 1.4587$ (122). — However, Č with SO_2Cl_2 under reflux (121) (or β -chloroethyl chlorosulfonate + β -chloroethyl nitrite (above) (122)) gives (50% yield (121)) bis-(β -chloroethyl) sulfate = (ClCH₂CH₂O)₂SO₂ [Beil. I₂-(336)], b.p. 154-154.5° at 8 mm. (121), 130° at 3.5 mm. (122), m.p. + 11° (121), $D_4^{20} = 1.4801$ (121), $n_D^{20} = 1.4622$ (121), 1.4620 (122).]

With phosphoryl chloride (POCl₃). [\bar{C} with POCl₃ at 0° (150) or in CCl₄ at room temp. (151) gives (46–47% yield (151)) β -chloroethylphosphoryl dichloride = ClCH₂CH₂OP-(O)Cl₂ [Beil. I₂-(337)], b.p. 108–110° at 15 mm. (151). — \bar{C} with POCl₃ in pyridine at -20° gives (140) the salt of mono-(β -chloroethyl)phosphoric acid = ClCH₂CH₂OP(O)-(OH)₂ [Beil. I₁-(170), I₂-(336)]. — \bar{C} with POCl₃ in CCl₄ refluxed 16 hrs. gives (60% yield (152) cf. (140)) tri-(β -chloroethyl) phosphate = (ClCH₂CH₂O)₃PO [Beil. I₂-(337)], b.p. 180–182° at 2–3 mm., D_{20}^{20} = 1.428 (152). — For patent on reaction of \bar{C} with POCl₃ see (153).]

With boron trifluoride (BF₃). [Č with BF₃ forms a molecular compound (154) BF₃.2Č which can be distilled in vac. without decompn.; b.p. 59° at 2 mm., $D_4^{20} = 1.4009$, $n_{\rm He}^{174} = 1.40841$ (154).]

With silicon tetrachloride (SiCl₄). [\bar{C} (4 moles) with SiCl₄ (1 mole) yields (155) (96) tetra-(β -chloroethyl) orthosilicate, (ClCH₂CH₂O)₄Si [Beil. I-337, I₂-(337)], b.p. 195-200° at 15 mm. (156), 170-180° at 8 mm. (96) (also obtd. (156) from SiCl₄ + β -chloroethyl nitrite (above)).]

Behavior with alkalies. \bar{C} with alkalies (or appropriate acid acceptors) loses HCl to yield according to conditions either ethylene glycol (1:6465) or ethylene oxide (1:6105).

[E.g., \bar{C} with aq. NaOH on htg. hydrolyzes to ethylene glycol (1:6465); for general articles on this process see (54) (157) (158) (22); for studies of kinetics of the reaction see (404) (18) (159) (160) (161); for examples of patents on hydrolysis of \bar{C} to ethylene glycol by use of aq. alkali or alkaline-earth hydroxides, carbonates, or bicarbonates see (162) (163) (63) (164) (165) (166) (167).]

[\overline{C} added dropwise to 70% aq. NaOH (168) (169) or hot CaO (170) gives ethylene oxide (1:6105), b.p. +10.7°; for patents on this conversion see (171) (172) (173) (174) (175).]

Behavior with alkali sulfhydrate. [\bar{C} with NaSH (from Na₂S.9H₂O satd. with H₂S (137)) at 55-65° (137) (176) or \bar{C} with NaSH in alc. for 36 hrs. at room temp. (177) gives (yields: 55% (176), 50-55% (137), 26-30% (177)) β -hydroxyethyl mercaptan ("monothioethylene glycol") = HOCH₂CH₂SH [Beil. I-470, I₂-(523)], b.p. 157-158° dec. at 742

mm. (178), 61° at 18 mm. (179), 58° at 18 mm. (137), 55° at 13 mm. (178), 52° at 12 mm. (177); $D_4^{20} = 1.1143$ (178); $n_D^{20} = 1.4996$ (178) (corresp. bis-(N-phenyl)carbamate, m.p. 146° (178); corresp. metallic mercaptide derivs. many of which have m.p.'s (178).]

Behavior with ammonia (for amines see below under behavior with organic reactants). [Č with aq. NH₄OH gives (180) a mixt. of three hydroxyamines, viz., β-hydroxyethylamine (2-aminoethanol-1) [Beil. IV-274, IV₁-(424), IV₂-(717)]; bis-(β-hydroxyethyl)amine ("diethanolamine") [Beil. IV-283, IV₂-(729)]; and tris-(β-hydroxyethyl)amine ("triethanolamine") [Beil. IV-285, IV₂-(729)]. — Although all three of these products are now extremely important industrial compounds, they are usually manufactured from ethylene oxide with NH₃ and details lie beyond the scope of this text. — However, for a useful monograph see (181).]

Behavior with hydrazine (NH₂.NH₂). [\bar{C} with 1 mole hydrazine loses HCl yielding (182) β -hydroxyethylhydrazine + hydrazine hydrochloride; \bar{C} with 2-3 moles hydrazine yields (182) ethylene oxide accompanied by a little N,N-bis- $(\beta$ -hydroxyethyl)hydrazine.]

BEHAVIOR OF C WITH ORGANIC REACTANTS

Behavior with hydrocarbons. $[\bar{C} \text{ with } C_6H_6 + \text{AlCl}_3 \text{ (followed by aq.)} \text{ is claimed } (183) \text{ to yield } \beta\text{-phenylethyl alc. } (1:6505), \text{ but this has subsequently been denied } (184) \text{ where } 1,2\text{-diphenylethane (bibenzyl) } (1:7149) \text{ and resin were the only prods. obtd. } (See also below under behavior of <math>\bar{C}$ with organometallic cpds.)]

Behavior with organic hydroxyl compounds. With alcohols (see also below under carbohydrates). \bar{C} (anhydrous) with sodium alkoxides (from prim. or sec. aliphatic or aromales. + Na) on htg. splits out NaCl giving the corresp. mono ethers of ethylene glycol.

[E.g., $\bar{\mathbf{C}}$ with NaOMe gives (35% yield (185)) β -hydroxyethyl methyl ether (1:6405) q.v.; $\bar{\mathbf{C}}$ with NaOEt gives (60% yield (185)) β -hydroxyethyl ethyl ether (1:6410) q.v.; $\bar{\mathbf{C}}$ with NaOPr gives (40% yield (185)) β -hydroxyethyl n-propyl ether (1:6414) q.v.; $\bar{\mathbf{C}}$ with NaOisoPr gives (25% yield (185)) β -hydroxyethyl n-porpyl ether (1:6430) q.v.; $\bar{\mathbf{C}}$ with NaOBu gives (30% yield (185)) β -hydroxyethyl n-butyl ether (1:6430) q.v.; $\bar{\mathbf{C}}$ with NaOiso-Bu gives (36% yield (185)) β -hydroxyethyl n-amyl ether, b.p. 181° at 745 mm. (185).] $\bar{\mathbf{C}}$ with NaOCH₂C₆H₅ similarly gives (186) (187) ethylene glycol monobenzyl ether

(1:6533) q.v.] With carbohydrates (or their relatives). [\bar{C} with d-glucose + HCl yields (188) cf. (189)

2-chloroethyl-d-glucoside.] [\bar{C} with "acetobromglucose" + Ag₂CO₃ (190) (193) in C₆H₆ (189) (191) gives (yields: 69% (189), 45–50% (190)) tetra-acetyl- β -d-(β -chloroethyl)glucoside (tetra-acetyl- β -d-glucosido-ethylene chlorohydrin), m.p. 119–120° (192), 118.5–119.5° (189), 114° cor. (190) (191). — For isomerization of this prod. (in boilg. CHCl₃ for 6½ hrs.) to tetra-acetyl- α -d-(β -chloroethyl)glucoside, m.p. 82–83°, see (194).]

[\bar{C} with "acetobromogalactose" + Ag₂CO₃ (190) (194) in C₆H₆ (191) gives (77% yield (194)) tetra-acetyl- β -d-(β -chloroethyl)galactoside, m.p. 117° cor. (190) (191), 115.5–116.5° (194).]

[For analogous prepn. from \tilde{C} of triacetyl- β -d-(β -chloroethyl)xyloside, m.p. 137° cor., or of hepta-acetyl- β -d-(β -chloroethyl)lactoside, m.p. 78–80°, see (190) (191).]

[For condens. of \overline{C} with mannitol (1:5830) or sorbitol (1:5820) see (195).]

[For use of \bar{C} in degradation ("depolymerization") of cellulose or starch see (196) (197); for use of \bar{C} + NaOH in introduction of β -hydroxyethyl groups into cellulose see (198).]

With aliphatic mercaptans. C with salts of alkyl or alkaryl mercaptans gives the corresp. S-monoethers of monothioethylene glycol.

[E.g., C with NaSMe in abs. alc. (199) (200) or ether (201) (202) or less advantageously

 \bar{C} with KSMe in aq. alc. (201) gives (yields 74–82% (199), 78% (201), 40% (199)) β-hydroxyethyl methyl sulfide (β-methylmercaptoethanol) [Beil. I₂-(524)], b.p. 80.5–81° at 30 mm. (201), 68–70° at 20 mm. (199), $D_{20}^{20} = 1.0640$ (201), $n_{D}^{20} = 1.4867$ (201); this prod. with MeI in dry ether gives on stdg. in cold the corresp. dimethyl-β-hydroxyethylsulfonium iodide, hygroscop. cryst. from MeOH/ether, m.p. 60–62° (202). — \bar{C} with EtSH in alc./NaOEt (203), in alc. KOH (132), or even in conc. aq. KOH (204) gives (yield 70–74% (203)) β-hydroxyethyl ethyl sulfide [Beil. I-470, I₂-(525)], b.p. 184° (204) (132), 182–184° u.c. (203), $D_{4}^{20} = 1.0166$ (132), $n_{D}^{20} = 1.48669$ (132).]

[\bar{C} with n-BuSH in hot aq. NaOH refluxed 1 hr. gives (81% yield (205)) β -hydroxyethyl n-butyl sulfide [Beil. I₂-(525)], b.p. 92-93° at 3 mm., $D_{25}^{25} = 0.9693$, $n_D^{20} = 1.4800$ (205). — \bar{C} with allyl mercaptan in conc. aq. KOH gives (50% yield (206)) β -hydroxyethyl allyl sulfide [Beil. I₂-(525)], b.p. 91° at 12 mm., $D_{20}^{20} = 1.0283$ (206). — \bar{C} with NaSCH₂C₆H₅ in aq. soln. gives (100% yield (179)) β -hydroxyethyl benzyl sulfide, b.p. 169° at 18 mm.]

[C with ethylene dithioglycol (HSCH₂CH₂SH) + powdered NaOH htd. 1 hr. gives (177) ethylene dithioglycol bis-(β-hydroxyethyl ether) = HOCH₂CH₂—S—CH₂CH₂—S—CH₂CH₂OH [Beil. I₂-(533)], lfts., m.p. 62-63°.]

With phenols. [\bar{C} with phenol (1:1420) in aq. NaOH (207) or alc. NaOEt (208), or \bar{C} with NaOC₆H₅ on htg. (17) (209), or \bar{C} with KOC₆H₅ at 150° for 6 hrs. (210), or \bar{C} with phenol salt refluxed 8 hrs. (211) gives (yields: 84% (17), 79% (207), 55–62% (211), 50% (209)) β-hydroxyethyl phenyl ether (β-phenoxyethanol) (1:6518) q.v., b.p. at 80 mm. = 165° (211), 163–166° (208), 163–167° (210), b.p. 128–130° at 20 mm. (17), 134–135° at 18 mm. (209). — (Note that \bar{C} with NaOC₆H₅ in pres. of Et₃N gave only 12.5% yield (212) of β-phenoxyethanol.)]

[Similarly $\bar{\mathbb{C}}$ with aq. sodium o-nitrophenolate in s.t. at 125° for 20 hrs. gives (213) β -(o-nitrophenoxy)ethanol, oil, b.p. 180–182° at 4 mm., m.p. 35–36° (215) (corresp. acetate, oil; corresp. benzoate, m.p. 75–76° (213)); $\bar{\mathbb{C}}$ with m-nitrophenol with 40% aq. KOH at 100° for 2 hrs. (213), or with 2 N NaOH reflux d 4 hrs. (214), gives β -(m-nitrophenoxy)ethanol, m.p. 90–91° (213), 88° (214), 87–88° (215); $\bar{\mathbb{C}}$ with sodium p-nitrophenolate in 50% alc. in s.t. at 120° for 23 hrs. (213), or in boilg. AmOH (216) (217), gives β -(p-nitrophenoxy)ethanol, m.p. 101–102° (213), 94–95° (216), 92–94° (215) (corresp. acetate, m.p. 85–87°; corresp. benzoate, m.p. 116° (213).]

[Analogous condensations of \bar{C} with other monohydric phenols include the following: for \bar{C} with o-cresol (1:1400) (218), with β -naphthol (1:1540) (218), with m-methoxyphenol (1:1765) (219) (220) (221), with methyl p-hydroxybenzoate (1:1549) (222), with p-bromophenol (218), with p-acetylaminophenol (213), with m-diethylaminophenol (212), with 8-hydroxyquinoline (212) see indic. refs.]

[Analogous condensations of \bar{C} with polyhydric phenols include the following: with pyrocatechol (1:1520) (223), resorcinol (1:1530) (224) (218), 4-acetylresorcinol (219), 4-ethylresorcinol (219) see indic. refs.]

With throphenols. [\bar{C} with throphenol in alc. NaOEt (225) (203) or in 10% aq. KOH (226) gives (76% yield (203)) β -hydroxyethyl phenyl sulfide, b.p. 245° (203), 144.5° at 26 mm. (203), 134-135° at 7 mm. (225), 115-116° at 2 mm. (226), $D_4^{20} = 1.1431$ (226), $n_D^{25} = 1.5897$ (225), $n_D^{20} = 1.5917$ (226). $-\bar{C}$ with p-toly mercaptan in conc. aq. NaOH at 100° for 2 hrs. gives (83% yield (133)) (227) β -hydroxyethyl p-tolyl sulfide, b.p. 282-283° dec., 174° at 30 mm. (133).]

[For analogous condens. of \bar{C} with o-nitrophenyl mercaptan (228), m-nitrophenyl mercaptan (228), p-nitrophenylmercaptan (228) (229), o-carboxythiophenol (230), and many other thiophenols (231) see indic. refs.]

Behavior of \tilde{C} with organic ethers (or epoxy cpds.). [\tilde{C} with ethylene oxide (1:6105) + conc. H₂SO₄ gives (30-35% yield (232)) 2-(β -chloroethoxy)ethanol-1 (3:9185) accompanied

by other prods.: for behavior of \bar{C} with epichlorohydrin (3:5358) or with α -ethyl- α -methyl-ethylene oxide see (232). — \bar{C} with α,β' -dichlorodiethyl ether (3:9150) stood 24 hrs. at room temp., then htd. 1 hr., gives (27% yield (233)) acetaldehyde bis-(β -chloroethyl) acetal. (see below). — \bar{C} with bis-(α -chloroethyl) sulfide gives (234) β -trithioacetaldehyde, m.p. 125°. — For behavior of \bar{C} with 2,3-dichlorodioxane (3:9105) see (235); with 1,4-dithiane see (131).]

Behavior of \tilde{C} with carbonyl compounds. \tilde{C} with aldehydes or their polymers. [\tilde{C} with paraformaldehyde (1:0080) + dry HCl gas gives (yields: 65% (237), 55% (236)) (238) (239) chloromethyl β -chloroethyl ether [Beil. I-581, I₂-(645)], b.p. 145-147° (237), 46° at 10 mm. (236); $D_4^{20} = 1.2817$ (237), 1.2814 (236); $n_2^{20} = 1.4578$ (236), 1.4592 (237). — Note that this prod. with \tilde{C} (239), or \tilde{C} (8 wt. pts.) + paraformaldehyde (1 wt. pt.) + CaCl₂ + HCl gas refluxed 5 min. (38) gives formaldehyde bis-(β -chloroethyl)acetal [Beil. I-575], b.p. 218-219° (239), 218.1° at 760 mm. (240), b.p. 93-94° at 11 mm. (38), now an industrial prod. in U.S. because of its use in manufact. of self-sealing gasoline tanks (240).]

[$\bar{\mathbf{C}}$ with acetaldehyde (1:0100) (241) (20) (233) or paraldehyde (1:0170) (236) + HCl gas gives according to circumstances either α -chloroethyl β -chloroethyl ether (3:9150) q.v. or acetaldehyde bis-(β -chloroethyl)acetal, b.p. 194-196° dec. (233), 109-110° at 30 mm. (20), 106° at 17 mm., $D_{-}^{19} = 1.1712$, $n_{D}^{16} = 1.4532$ (233).]

[C with propional dehyde (1:0110) + HCl gas gives (51% yield (236)) β -chloroethyl α -chloro-n-propyl ether, b.p. 60° at 10 mm., $D_4^{20} = 1.1399$, $n_D^{20} = 1.4496$ (236).]

[Č with *n*-butyraldehyde (1:0130) + HCl gas gives (70% yield (236)) β -chloroethyl α -chloro-*n*-butyl ether, b.p. 71° at 10 mm., $D_4^{20} = 1.1009$, $n_D^{20} = 1.4471$ (236).]

 \bar{C} with diketene. [\bar{C} with diketene (242) gives (243) β -chloroethyl acetoacetate.]

Behavior of \bar{C} with organic acids. \bar{C} with organic acids under appropriate conditions behaves conventionally as a substituted ethyl alcohol yielding the corresponding β -chloroethyl esters. Since the number of possibilities is enormous, no attempt can be made here to list all such cases; only a few typical examples must suffice. Note, moreover, that, because during ordinary esterification hydrolysis of the chlorine atom of \bar{C} may occur, many esters of \bar{C} are best made from its reaction with acyl halides q.v.

[$\bar{\mathbf{C}}$ with anhydrous formic acid (1:1005) in pres. of anhydr. Na₂SO₄ (244) or of HCl gas (245) gives β -chloroethyl formate, b.p. 132° at 764 mm. (245), 127-129° at 768 mm. (244), $D_4^{20} = 1.2214$ (244); for study of rate of esterification of $\bar{\mathbf{C}}$ by formic acid under various circumstances see (246).]

[C with anhydr. oxalic acid (1:0535 on satn. with HCl gas and htg. at 100° gives (245) di-(β-chloroethyl) oxalate (3:0572), m.p. 45°.]

[\bar{C} with 2-hydroxy-5-methylbenzoic acid (*p*-cresotinic acid) + conc. H₂SO₄ gives β -chloroethyl *p*-cresotinate, b.p. 136-139° at 10 mm. (247).]

[$\ddot{\mathbf{C}}$ with p-aminobenzoic acid + conc. H₂SO₄ gives (248) (249) β -chloroethyl p-aminobenzoate.]

Behavior of \tilde{C} with salts of organic acids. \tilde{C} with sodium salts of organic acids on htg. eliminates NaCl yielding the corresp. β -hydroxyethyl esters; however, not infrequently secondary reactions of this product then occur or can readily be caused to occur, such as loss of water, ring closure, etc.

[\bar{C} with aq. NaCN at 45–50° for 5 hrs. (250) (251), or with alc. NaCN at 100° for 6 hrs. (88) (27), or with KCN in 50% alc. (252) or boilg. alc. (253) (254), gives (yields: 86% (27), 85–95% (251), 79–80% (250), 71% (253)) β -hydroxyethyl cyanide (β -hydroxypropionitrile = hydracrylonitrile = ethylene cyanohydrin) [Beil. III-298, III₁-(113), III₂-(213)], b.p. 116–118° at 20 mm. (250), 110° at 15 mm. (27) (253), 107–109° at 12 mm. (250).]

[C (1 mole) with NaHCO₃ (1 mole solid) or with Na₂CO₃ (½ mole solid) as directed (255) is claimed to give (80% yield) monomeric ethylene glycol carbonate (CH₂)₂O₂CO₋]

[$\ddot{\mathbf{C}}$ (1 mole) with KSCN (1 mole) in excess $\ddot{\mathbf{C}}$ (1.5 moles as solv.) on warming does not yield the expected β -hydroxyethyl thiocyanate, since this prod. spontaneously undergoes bimolecular self-condensation evolving COS and producing (45% yield (256)) 1-(β -hydroxyethyl)imidazolidthione-2, m.p. 167-168° dec.; for behavior of this prod. with ethereal HCl see (257).]

[Č with NaOBz at 145° (258) or Č with NaOBz + a little Et₂NH at 130° for 4 hrs. (259), or Č with KOBz as directed (260), gives (yields: 85% (259), 33% (260)) ethylene glycol monobenzoate (β -hydroxyethyl benzoate), m.p. 36.5-37.5° (261), 36-37° (260) cf. (259); b.p. 173° at 21 mm. (259), 156° at 14 mm. (260), 150-151° at 10 mm. (261) (corresp. p-toluenesulfonate, m.p. 74-75° (262)).]

[Č with Na p-nitrobenzoate + a little Et₂NH at 130° for 4 hrs. (259), or \tilde{C} with K p-nitrobenzoate in C₆H₆ in s.t. at 100° (263), gives (yields: 83% (259), 60% (263)) ethylene glycol mono-(p-nitrobenzoate), m.p. 77-78° (263), 77° (259).]

[For analogous behavior of \tilde{C} with sodium salicylate (259), sodium sorbate (264), sodium methylarsenite (265), sodium p-toluenesulfinate (133), or sodium naphthenate (266) see indic. refs.]

Behavior of \tilde{C} with acid chlorides of organic acids. \tilde{C} with acid chlorides of organic acids behaves as a substituted primary alcohol splitting out H from its OH with Cl from the acid chloride to yield the corresp. β -chloroethyl esters. No attempt can be made here to list all possible cases, but the following text will furnish ample illustrative examples.

With acid chlorides of aliphatic acids. [\bar{C} with acetyl chloride (3:7065) gives (yields: 90% (267), 82% (248)) (268) β -chloroethyl acetate (3:5735) q.v. — \bar{C} with trichloroacetyl chloride (3:5420) + pyridine in ether gives (45% yield (103)) (275) β -chloroethyl trichloroacetate (3:6510) q.v. — \bar{C} with sorbyl chloride (CH₃CH = CH — CH = CH — CO.Cl) [Beil. I-484, I₂-(453)] gives alm. quant. (269) β -chloroethyl sorbate, b.p. 115° at 15 mm. (269). — For studies of rate of reactn. of \bar{C} with various acyl chlorides in dioxane soln. at 15°, 25°, and 35° see (270). — \bar{C} with malonyl (di)chloride (3:9030) gives bis-(β -chloroethyl) malonate, b.p. 164° at 15 mm. (271).]

With various chloroformates. \bar{C} with carbonyl chloride (phosgene) (3:5000) at room temp. gives (272) (121) (273) (125) only (yield 82% (273), 78% (121)) β -chloroethyl chloroformate (3:5780) q.v.: note that no bis-(β -chloroethyl) carbonate (see below) is formed.]

[\bar{C} with trichloromethyl chloroformate ("diphosgene") (3:5515) gives (61% yield (274)) β -chloroethyl trichloromethyl carbonate = ClCH₂CH₂O.CO.O.CCl₃, b.p. 115° at 16 mm., 110° at 12 mm., $D_4^{20} = 1.5664$, $n_D^{20} = 1.4748$ (274).]

[\bar{C} with β -chloroethyl chloroformate (3:5780) gives (70% yield (121)) di-(β -chloroethyl) carbonate (3:6790) q.v.]

With acid chlorides of aromatic acids. [C with benzoyl chloride on htg. gives (yields: 90% (276), 84.5% (277), 55% (263)) β -chloroethyl benzoate (3:8860) q.v.]

Behavior of \tilde{C} with organic esters of inorganic acids. [\tilde{C} with Me₂SO₄ at 120° as directed gives (60% yield (126)) β -chloroethyl methyl ether (β -methoxyethyl chloride) (3:7265) q.v.]

[\bar{C} with Et₂SO₄ + solid NaOH on htg. gives (278) ethylene glycol monoethyl ether ("Cellosolve") (1:6410); note, however, that \bar{C} with EtOH + conc. H₂SO₄ at 145° gives (279) β -chloroethyl ethyl ether (3:7463).]

[$\ddot{\mathbf{C}}$ (1 mole) with ethyl metaphosphate (1 mole) stood 4 days at room temp. (280) cf. (281) gives β -chloroethyl ethyl hydrogen phosphate (isolated as barium salt); however, $\ddot{\mathbf{C}}$ + ethyl metaphosphate in CHCl₃ refluxed 3 hrs. gives (140) β -chloroethyl dihydrogen phosphate (isolated as barium salt).]

 \bar{C} with organic hypochlorites (or mixtures which yield them) gives ethers [e.g., \bar{C} with ter-butyl hypochlorite (3:7165) + ethylene gives (60.8% yield (282)) β,β' -dichlorodiethyl

ether (3:6025). — \bar{C} with N,N-dichlorobenzenesulfonamide + butene-1 in CHCl₃ at -15° gives (283) (probably via formn. and addn. of β -chloroethyl hypochlorite) 1-chloro-2-(β -chloroethoxy)butane, b.p. 195.5°, $D_4^{20}=1.1223$, $n_D^{20}=1.453$; the use of butene-2 or of 2-methylpropene (isobutylene) gives analogous products (283) cf. (284).]

Behavior of C with organometallic compounds (or their equivalents). [C with KC_6H_5 splits out KCl yielding (285) β -phenylethyl alc. (1:6505).]

 $\bar{\mathbf{C}}$ with arom. RMgX cpds. reacts in analogous fashion yielding the corresp. alcohols [e.g., $\bar{\mathbf{C}}$ with C_6H_6MgBr (287) (288) or C_6H_6MgCl (289) gives (95% yield (286)) β -phenylethyl alc. (1:6505); $\bar{\mathbf{C}}$ with o-tolyl MgBr gives (20–24% yield (290)) (287) β -(o-tolyl)ethanol; $\bar{\mathbf{C}}$ with m-tolyl MgBr gives (20–24% yield (290)) β -(m-tolyl)ethanol; $\bar{\mathbf{C}}$ with p-tolyl MgBr gives (yields: 80% (291), 20–24% (290)) (287) β -(p-tolyl) ethanol; many other analogous cases are known].

[Note that \tilde{C} with C_2H_5MgBr gives (292) ClCH₂CH₂OMgBr which may then be reacted with RMgBr types as above (292).]

[$\bar{\mathbf{C}}$ with diethyl malonate in alc. NaOEt (i.e., diethyl disodiomalonate) might be expected to yield diethyl bis- $(\beta$ -hydroxyethyl)malonate; this compd., however, is unknown since it loses 2 EtOH, ring-closing to (271) the spiro-dilactone of bis- $(\beta$ -hydroxyethyl)malonic acid [Beil. XIX₁-(680)], m.p. 109-110°.] — [Note also that $\bar{\mathbf{C}}$ (1 mole) with diethyl malonate (1 mole) + 1% HCl gas undergoes transesterification yielding (405) both β -chloroethyl ethyl malonate, b.p. 105-106° at 3 mm., and bis- $(\beta$ -chloroethyl) malonate, b.p. 142-143° at 3 mm.]

[C with ethyl acetoacetate + alc. NaOEt (i.e., ethyl sodio-acetoacetate) boiled 5 hrs. gives a prod. (probably lactone of α -(β -hydroxyethylacetoacetic acid) which with 10% HCl after 5 hrs. boiling gives (40% yield (293)) pentanone-4-ol-1 (γ-aceto-n-propyl alc.) [Beil. I-831, I_I-(422), I₂-(873)], b.p. 115-116° at 20 mm. (294), D_4^{20} = 1.0071 (295), n_D^{20} = 1.439 (294) (corresp. semicarbazone, m.p. 167-168° (296)): note that this prod. (which is an important intermediate in the prepn. of the antimalarial "Atabrine" (297)) is best prepd. from ethylene oxide + ethyl sodioacetoacetate which gives first (60% yield (294)) the lactone of α -(β -hydroxyethyl)acetoacetic acid, b.p. 142-143° at 30 mm., n_D^{20} = 1.4562, which with warm HCl ring-opens and splits off AcOH giving (96% yield (294)) desired γ-aceto-n-propyl alc. (above).]

[\bar{C} + sodium phenobarbital (Na deriv. of 5-ethyl-5-phenylbarbituric acid) gives (60% yield (298)) 1-(β -hydroxyethyl)phenobarbital, m.p. 145.0-145.5° cor. (note that this prod. is not obtd. from \bar{C} + Ag salt of phenobarbital). — \bar{C} with theobromine (3,7-dimethylxanthine) in aq. NaOH in s.t. at 125° for 6 hrs. gives (47-57% yield (366)) (367) 1-(β -hydroxyethyl)theobromine, m.p. 194° (367), 193° (366).]

Behavior of \bar{C} with amines. With primary aliphatic amines. $[\bar{C}]$ (1 mole) with aq. MeNH₂ (1 mole) at 110° for 12–24 hrs. gives (80% yield (299)), β -(methylamino)ethanol [Beil. IV-276, IV₂-(718)], b.p. 159° (300) (301), 155–156° at 760 mm. (273) (corresp. 3,5-dinitrobenzoate, m.p. 195–196.5° (302); corresp. \bar{B} .PkOH, 148° (303); corresp. reaction prod. with α -naphthyl isothiocyanate, viz., N-(β -hydroxyethyl)-N-methyl-N-(α -naphthyl) thiourea, m.p. 125° (303)). — \bar{C} with excess aq. MeNH₂ on standing in s.t. at 100° for several hrs. (304) or \bar{C} with β -(methylamino)ethanol (above) in aq. at 120° (299) gives methyl-bis-(β -hydroxyethyl)amine (N-methyl-diethanolamine) [Beil. IV-284, IV₂-(729)], b.p. 115° at 5 mm. (240) (note that this prod. is new commercial chem. in U.S. (240)).]

[Č with EtNH₂ as above should give β-(ethylamino)ethanol [Beil. IV-282, IV₂-(727)], b.p. 167-169° cor. at 751 mm., $D_4^{20} = 0.914$, $n_D^{20} = 1.444$, and (305) ethyl-bis-(β-hydroxy-ethyl)amine (N-ethyldiethanolamine) [Beil. IV-284], although both these prods. are usually prepd. from ethylene oxide.]

[For analogous reactn. of \bar{C} with *n*-heptadecylamine yielding N-(β -hydroxyethyl)-n-

heptadecylamine see (306) (307); with cyclohexylamine yielding N-(β -hydroxyethyl)-cyclohexylamine see (308).]

With primary aromatic amines. [$\bar{\mathbb{C}}$ (1 mole) with aniline (1 mole) refluxed a short time (299) (309) (310) (311) (312) (313) gives (yields: 70% (309), 40% (311)) N-(β -hydroxyethyl)amiline (β -phenylaminoethanol) [Beil. XII-182], b.p. 286° cor. (299), $n_D^{20} = 1.5749$ (317) (note that by reactn. of a second mole of $\bar{\mathbb{C}}$ some N,N-bis-(β -hydroxyethyl)aniline (see below) may also form, and that some N,N'-diphenylethylenediamine, m.p. 63.4-64.2°, may also appear (311)); note also that N-(β -hydroxyethyl)aniline on dehydration, e.g., by htg. in xylene with P_2O_5 (310), reacts bimolecularly giving in small yield N,N'-diphenylpiperazine, m.p. 160–162° (310). — $\bar{\mathbb{C}}$ (2 moles) with aniline (1 mole) especially in pres. of anhydr. Na₂CO₃ (310) or NaOH (314) or aq. at 110° (299) gives N,N-bis-(β -hydroxyethyl)aniline (N-phenyldiethanolamine) [Beil. XII-183, XII₁-(167)], m.p. 58° (315), 53.5-54° (310): note that this prod. on htg. at 200° under reduced press. (314) or htg. with P_2O_5 in xylene (310) or htg. with 70% H₂SO₄ at 160° (316) loses water and ring-closes to N-phenylmorpholine [Beil. XXVII-6], m.p. 53° (299), 52° (310).]

[Č (1 mole) with o-toluidine (2 moles) at 120–130° for several hrs. (318) (313) gives β -(o-tolylamino)ethanol, b.p. 172° at 12 mm. (318), 145–150° at 3 mm. (317), $n_D^{20} = 1.5675$ (317); note that in pres. of Na₂CO₃ the main (318) prod. (because of bimolecular condens. of this prod.) is N,N'-di-o-tolylpiperazine [Beil. XXIII-8], m.p. 174°. — Č with p-toluidine on htg. gives (319) β -(p-tolylamino)ethanol [Beil. XIII-907], b.p. 177–178° at 14 mm. (319), m.p. 42–43° (317); note, however, that analogous bimolecular ring closure of this prod. readily occurs on htg. yielding (320) N,N'-di(p-tolyl)piperazine [Beil. XXIII-9], m.p. 190°.]

[\bar{C} with o-methoxyaniline (o-anisidine) at 100° for 48 hrs. gives (75–80% yield (321)) (299) β -(o-methoxyphenylamino)ethanol [Beil. XIII-367], b.p. 305° cor. (299) (corresp. \bar{B} .HCl, m.p. 134°; \bar{B} .PkOH, m.p. 140° (321)); note that this prod. with 5 pts. conc. HCl in s.t. at 160–180° gives by a remarkable elimination of MeOH and monomolecular ring closure (38% yield (321)) (299) "phenmorpholine" [Beil. XXVII-34], b.p. 268° cor. (299), 127–128° at 12 mm. (321). — \bar{C} with p-ethoxyaniline (p-phenetidine) gives on htg. (319) β -(p-ethoxyphenylamino)ethanol, m.p. 67°, b.p. 190° at 11 mm. (319) cf. (322).]

Many other cases, analogous to the above examples, are also known but cannot be included here.

With secondary aliphatic amines. Because of the great importance of β -(dialkylamino)-ethanols in the prepn. and study of physiologically active compounds, much study has been given to their prepn. from \tilde{C} (and otherwise). From the resulting mass of data, the following examples are cited.

[\bar{C} with Me₂NH gives (323) β -(dimethylamino)ethanol [Beil. IV-276, IV₁-(425), IV₂-(719)], b.p. 135° cor. at 758 mm., $D_4^{20}=0.8866$, $n_D^{20}=1.4300$ (324) (corresp. p-nitrobenzoyl ester, m.p. 58° (325)). — \bar{C} with Et₂NH on htg. (326) under reflux for 8 hrs. (327) or in pres. of NaOH under press. at 160° for 3 hrs. (328) gives (yields: 83% (328), 68–70% (327)) β -(diethylamino)ethanol [Beil. IV-282, IV₂-(727)], b.p. 163° at 760 mm. (329), 160° at 741 mm., 100° at 80 mm., 96° at 73 mm., 55° at 10 mm. (330), 42–44° at 8 mm. (329); $D_{25}^{25}=0.8601$ (329); $n_D^{25}=1.4400$ (329), 1.4389 (330) (corresp. N-(p-nitrophenyl)carbamate, m.p. 59–60° cor. (329)).]

[\bar{C} with di-n-propylamine under reflux gives (70% yield (331)) β -(di-n-propylamino)-ethanol [Beil. IV-282], b.p. 90-92° at 22 mm. (331) (corresp. p-nitrobenzoyl ester hydrochloride, m.p. 133.5-134.5° (325)). — \bar{C} with di-n-butylamine on htg. gives (332) (333) β -(di-n-butylamino)ethanol, b.p. 225-230° at 760 mm., sl. dec. (332), 226-228° at 738 mm. (325), 90-94° at 7 mm. (333); $D_{20}^{20} = 0.8624$ (325); $n_{20}^{20} = 1.4444$ (325) (corresp. p-nitrobenzoyl ester hydrochloride, m.p. 92.5-93.5° (325) (332)). — \bar{C} with di-(isobutyl)amine

at 120° gives (60% yield (331)) β -(di-isobutylamino)ethanol [Beil. IV-283, IV₁-(430)], b.p. 203-206° (334), 96-98° at 15 mm. (331) (corresp. p-nitrobenzoyl ester hydrochloride, m.p. 160-161° (334)). — \bar{C} with di-(eec-butyl)amine gives (335) β -(di-sec-butylamino)ethanol, b.p. 225-226° cor. at 760 mm. (335), 224-226° at 745 mm. (325), $D_{20}^{20} = 0.8780$ (325), $n_{20}^{20} = 1.4475$ (325) (corresp. p-nitrobenzoyl ester, m.p. 51.0-51.5° (325)). — \bar{C} with discoamylamine on htg. gives (60% yield (331)) (334) β -(discoamylamino)ethanol [Beil. IV-283, IV₁-(430)], b.p. 126-128° at 15 mm. (331) (corresp. p-nitrobenzoyl ester hydrochloride, m.p. 123-124° (334) (325)).]

 \bar{C} with alicyclic secondary amines. $[\bar{C}$ with di-(cyclohexyl)amine gives (336) β -(dicyclohexylamino)ethanol, b.p. 145-150° at 4 mm. (336). $-\bar{C}$ with ac-tetrahydro- β -naphthylamine (2 moles) in xylene at 110-115° for 3 hrs. (under N₂) gives (80-85% yield (337)) β -(ac-tetrahydro- β -naphthylamino)ethanol hydrochloride, m.p. 183.8-184.8° cor. (337).

 \bar{C} with aromatic secondary amines. $[\bar{C}$ with N-methylaniline in s.t. at 100° for 35 hrs. gives (65% yield (338)) cf. (339) β -(N-methylanilino)ethanol [Beil. XII-182], b.p. 218–219° at 110 mm. (338), 148–150° at 13 mm. (340); note, however, the claim (341) that \bar{C} (1 mole) with N-methylaniline (1.5 moles) refluxed 10–12 hrs. gives (14% yield (341)) N,N'-diphenylpiperazine, m.p. 164–165°. — \bar{C} with N-ethylaniline on htg. without solv. (338) or in aq. (313) gives β -(N-ethylanilino)ethanol [Beil. XII-183], b.p. 269–271° at 750 mm. (340), 267–268.5° (338).]

 \bar{C} with heterocyclic secondary amines. [\bar{C} with piperidine at 100° (326), or \bar{C} with piperidine (2 moles) in acetone overnight at room temp. (342), gives β -(N-piperidine) ethanol (N-(β -hydroxyethyl)piperidine) [Beil. XX-25], b.p. 199° (326), 89-91° at 20 mm. (343), 90° at 12 mm. (342), $D_{25}^{25} = 0.9732$ (343), $n_{D_1}^{25} = 1.4749$ (343) (corresp. \bar{B} .HCl, m.p. 122-124° (343), 120° (344), 64-65° (342)) (note unexplained disagreement); \bar{B} .PkOH, m.p. 100° (345), benzoyl ester hydrochloride, m.p. 176° (346), 175-176° (347), 173-174° (348), 171-172° (345), 167-168° (342); p-nitrobenzoyl ester hydrochloride, m.p. 175-176° (342)).]

[$\bar{\mathbf{C}}$ with morpholine would be expected to yield N-(β -hydroxyethyl)morpholine (4-morpholineëthanol) although only vague reference (351) is reported; this prod. can, however, be prepd. indirectly from $\bar{\mathbf{C}}$ by ring closure of tris-(β -hydroxyethylamine)(triethanolamine) with 70% H₂SO₄ at 160-170° (349) (316), or from triethanolamine hydrochloride at 200-205° under pressure (40 mm.) for 14 hrs. (46% yield (350)); 4-morpholineëthanol [Beil. XXVII-7] is now comml. prod. in U.S. (351): b.p. 227° cor. at 757 mm. (349), 118-120° at 24 mm. (350); $D_4^{25} = 1.0681$ (350), $n_D^{25} = 1.4770$ (350) (corresp. benzoyl ester hydrochloride, m.p. 205° (346), 204.6-205.8° (350); corresp. p-nitrobenzoyl ester hydrochloride, m.p. 214.6-215.4° (350)).]

With tertiary amines. \bar{C} with tertiary amines behaves as an alkyl halide giving by addition to the tertiary amine nitrogen the corresp. quaternary ammonium salt. [E.g., \bar{C} (1 mole) with pyridine (1 mole) at 135° for 1 hr. (343) (352) cf. (344) (353) gives (100% yield (343)) β -hydroxyethyl-pyridinium chloride [Beil. XX-220, XX₁-(75)], hygroscopic flakes from abs. EtOH by addn. of dry ether, m.p. 124-125° (343).]

[$\check{\mathbf{C}}$ with 3-carbomethoxypyridine (methyl nicotinate) 1 hr. at 120° gives (343) β -hydroxyethyl-3-carbomethoxypyridinium chloride. — $\check{\mathbf{C}}$ with N,N-dimethyl-n-dodecylamine (354), or $\check{\mathbf{C}}$ with N,N-dimethyl-n-octadecylamine (354), or $\check{\mathbf{C}}$ with N-(n-heptadecylbenzimidazole) (355) gives corresp. quat. salts.]

Behavior of \tilde{C} with amides and sulfonamides. [For use of \tilde{C} as means of introduction of β -hydroxyethyl group into amides, diamides, ureas, etc., see (356).]

 $\{\bar{C} \text{ with sodium } p\text{-toluenesulfonamide at } 120^{\circ} \text{ for } 6 \text{ hrs. under press. } (357) \text{ gives } N\text{-}(\beta\text{-hydroxyethyl})-p\text{-toluenesulfonamide; this prod. on conversion to its sodio deriv. and further similar treatment with <math>\bar{C}$ (357) or \bar{C} with p-toluenesulfonamide + NaOH (358)

gives N,N-bis- $(\beta$ -hydroxyethyl)-p-toluenesulfonamide, cryst. from acetone, m.p. 101° (357); note that this last prod. upon ring closure with 100% H₂SO₄ at 160-170° gives N-(p-toluenesulfonyl)morpholine, hydrolysis of which yields (358) morpholine.]

[\bar{C} with the di-sodium deriv. of N,N' bis-(p-toluenesulfonyl)ethylenediamine at 100–110° for 10 hrs under press. gives (359) N,N'-bis-(p-toluenesulfonyl)ethylenediamine,

m.p. 144°.]

[Č (1 mole) with thiourea (1 mole) at not above 135° for 30 min. yields (360) S-(\$\beta\$-hydroxyethyl)isothiouronium chloride, m.p. 111° (360).]

Behavior of \tilde{C} with other miscellaneous nitrogen compounds (see also under \tilde{C} + organometallic cpds. above). [\tilde{C} with ethereal diazomethane undergoes conventional methylation of the hydroxyl group yielding (361) β -chloroethyl methyl ether (3:7265).]

[\bar{C} with aq. Na₂N.CN in cold (362) cf. (363) or with CaNCN on warming (362) gives a soln. of the monosodium deriv. of β -(cyanamido)ethanol, HOCH₂CH₂—NH—CN or HOCH₂CH₂—N=C=NH; although the parent cannot be isolated the soln. of its Na salt gives with acyl halides derivatives which can: e.g., with benzoyl chloride (2 moles) + aq. NaOH the soln. gives (362) the corresp. dibenzoyl deriv., m.p. 165°; with p-toluenesulfonyl chloride + [aq. NaOH the soln. gives (362) a mono-(p-toluenesulfonyl) deriv., m.p. 128° (which undoubtedly has the ring-closed structure of 3-(p-toluenesulfonyl-(1,3-oxazolidone-2)imide).]

[\bar{C} with acetyl isocyanate adds as an alcohol yielding (364) β -chloroethyl N-acetyl-carbamate, m.p. 73–74°. — \bar{C} with benzoyl isothiocyanate adds as an alc. at ord. temp. yielding (365) β -chloroethyl N-benzoylthioncarbamate, m.p. 179–180°.]

- β -Chloroethyl acetate: b.p. 145° (see 3:5735).
- —— β -Chloroethyl benzoate: b.p. 256° (see 3:8860).
- ① β -Chloroethyl p-nitrobenzoate [Beil. IX-390, IX₁-(158)]: ndls. from dil. alc., m.p. 56° (368) (369) (370), 55-56° cor. (371), 54.5-55.5° (103), 54-55° (372). [From \bar{C} with p-nitrobenzoyl chloride on warming (368) (371) (370); also from ethylene glycol (1:6465) + p-nitrobenzoic acid + HCl gas at 110° (372).]
- \oplus β -Chloroethyl 3,5-dinitrobenzoate: m.p. 92° (373). [From \bar{C} with 3,5-dinitrobenzoyl chloride on htg. (373).]
- --- β-Chloroethyl hydrogen 3-nitrophthalate: unreported.
- \bigcirc β -Chloroethyl hydrogen 4-nitrophthalate: m.p. 97-98° (374). [From $\stackrel{\circ}{C}$ with 4-nitrophthalic anhydride in C_6H_6 under reflux for 1 hr. (374).]
- β-Chloroethyl benzenesulfonate: oil, b.p. 184° u.c. at 9 mm. (375), 184° at 8-11 mm. (376), $D_4^{15} = 1.353$ (375). [From \bar{C} with benzenesulfonyl chloride under reflux for 3 hrs. (68% yield (377)) or on shaking with aq. NaOH in cold (68% yield (375)) (276); for study of decompn. into vinyl chloride (3:7010), acetaldehyde (1:0100), etc., on htg. see (378).]
- —— β-Chloroethyl p-toluenesulfonate: oil, b.p. 210° at 21 mm. (379) (380) (383), 192° at 15 mm. (386), 140° at 1.5 mm. (381), $n_D^{25} = 1.5280$ (381), m.p. +22.5° (381). [From \bar{C} with p-toluenesulfonyl chloride on refluxing 3 hrs. (87% yield (379)) (383) (382) or on shaking with aq. NaOH in cold (376); for reactions of this ester with RMgX cpds. see (384) (385) (386).]
- —— β-Chloroethyl carbamate [Beil. III-24, III₂-(21)]: m.p. 76° (125) (272) (387) (388). [Prepd. indirectly.]
- —— β-Chloroethyl N-phenylcarbamate [Beil. XII-320]: m.p. 51° (272) (389), 49.5–50.5° (103) (for data on optical props. see (389)); b.p. 133-135° at 2 mm. (390). [Note that this prod. has never been reported as prepd. by direct actn. of C with phenyl

- isocyanate but always by indirect means; note also that on short boilg. with aq. or alc. alk. it loses HCl and by ring closure yields 3-phenyloxazolidone [Beil. XXVII-136], lfts. from alc., m.p. 124° (272), 122° (309).]
- \odot β -Chloroethyl N-(p-bromophenyl)carbamate: pl. from lgr., m.p. 88–89° (400). [From \odot with p-bromobenzazide (400).]
- Φ β-Chloroethyl N-(α-naphthyl)carbamate [Beil. XII-1236]: m.p. 102-103° (373), 101° (391) (93), 100-101° (309). [From C with α-naphthyl isocyanate (391) (373); also from β-chloroethyl chloroformate (3:5780) with α-naphthylamine (309): note also that with dil. KOH (309) this prod. loses HCl ring-closing to 3-(α-naphthyl)-oxazolidone-2 [Beil. XXVII-136], m.p. 125° (309), while with conc. KOH it merely undergoes hydrolysis of chlorine yielding N-(β-hydroxyethyl)-α-naphthylamine, m.p. 52° (309).]
- —— β-Chloroethyl N-(β-naphthyl)carbamate [Beil. XII-1292]: m.p. 98° (309). [Prepd. indirectly from β-chloroethyl chloroformate (3:5780) with β-naphthylamine (309); for behavior with dil. and conc. KOH analogous to preceding case see (309).]
- β-Chloroethyl N-carbamidocarbamate (β-chloroethyl allophanate) [Beil. III₂-(56)]:
 m.p. 182.5° (392), 181–182° (388). [From C with vapors of isocyanic acid (392) or
 from β-chloroethyl chloroformate (3:5780) with urea (388).]
- --- N-(β -hydroxyethyl)phthalimide = (β -(N-phthalimido)ethanol) [Beil. XXI-469, XXI₁-(368)]: m.p. 129.5° cor. (394), 127-128° (395), 126.5-127.5° (357), 126-127° (396), 125-126° (397) (note that m.p. given by (393) is incorrect). [From \bar{C} with K phthalimide in s.t. at 150° for 4 hrs. (393): note that the m.p. of 88-89° reported by the only worker (393) using this method is not far from that (81° (395)) of N-(β -chloroethyl)phthalimide leaving some question as to which prod. was really obtd.]
- N-(β-hydroxyethyl)tetrachlorophthalimide: m.p. 208-209° (398). [From C with
 K tetrachlorophthalimide in s.t. at 200° for 6 hrs. (398).]
- —— β -Chloroethyl triphenylmethyl ether: m.p. 132° (399). [From \bar{C} with α -bromotriphenylmethane (399).]

$$\beta$$
-CHLOROPROPIONALDEHYDE C₃H₅OCl Beil. I - 632 (3-Chloropropanal-1; CH₂.CH₂.CHO I₁— I₂-(690)

B.P. 130–131° (1) $D_{-}^{15} = 1.268$ (1) $n_{-}^{15} = 1.475$ (1) 125–130° (2) 50° at 60 mm. (3) 40–44° at 18 mm. (4) 40° at 19 mm. (1) 40–50° at 10 mm. (2)

Liquid; insol. aq.; sol. alc. or ether. — C readily polymerizes (see below).

PREPARATION OF C

[For prepn. of \bar{C} from acrolein (1:0115) with dry HCl gas at -10 to -15° (yields: 87% (5), 65% (4)) (6) (7) (8) (9) (10) see indic. refs.; note that since HCl is present much of the prod. may appear as the trimer (see below); for prepn. of \bar{C} from its trimer (see below) by distillation at ord. press. see (1); for prepn. of \bar{C} from 1,3-dichloropropene-1 (3:5280) by cat. vapor-phase hydration see (20).]

CHEMICAL BEHAVIOR OF C

Polymerization. \bar{C} in the pres. of even traces of HCl readily polymerizes to a trimer (2), white cryst. from abs. EtOH (6) or MeOH at -10° (1), very sol. in ether, acetone, AcOH, CHCl₃, pet. ether, or C₆H₆ (1); m.p. 36° (1), 35.5° (6), 34.5-35.5° (11), 33.5° (2), 32° (10); b.p. (without depolymerization) 170-175° at 12-15 mm. (2); note that this trimer on distillation at ord. press. depolymerizes into \bar{C} (1).

Oxidation. \tilde{C} on oxidn. with fumg. HNO₃ (5) (6) (7) (8) (9) (12) or with conc. HNO₃ (13) gives (yields: 65-70% (7), 60-65% (8), 50% (6)) β -chloropropionic acid (3:0460). — \tilde{C} readily reduces AgNO₃ or Fehling's soln.

Behavior with other inorganic reactants. \bar{C} adds NaHSO₃, but the resultant compd. with dil. H₂SO₄ does *not* regenerate \bar{C} [for formn. of the KHSO₃ epd. of \bar{C} from β -chloropropionaldehyde diethylacetal (3:9490) see {14}].

[C with solid KOH on htg. gives (10) a polymer of acrolein (metaacrolein).]

[C with PCl₅ gives (15) (16) 1,1,3-trichloropropane (3:5660).]

Behavior with organic reactants. Acetal formation. [\bar{C} in MeOH with HCl gas presumably would yield β -chloropropionaldehyde dimethylacetal [Beil. I₁-335, I₂-(690)], b.p. 86° at 100 mm. (17), 51° at 19 mm. (1), 45° at 12 mm (18), $D_{-}^{20} = 1.059$ (18), $D_{-}^{15} = 1.064$ (1), $n_{-}^{20} = 1.41631$ (18), $n_{-}^{15} = 1.427$ (1), although such direct prepin. has not actually been reported; the prod. is usually obtd. from acrolem (1:0115) in MeOH with dry HCl gas (1) (17) (18) cf. (19). — Note, however, that in this process there is also formed some α,γ -dichloro-n-propyl methyl ether [Beil. I₂-(690)] (1), b.p. 55° at 19 mm. (1), 45° at 12 mm. (18), $D_{-}^{15} = 1.186$ (1), $n_{-}^{20} = 1.4478$ (18), $n_{-}^{15} = 1.450$ (1).]

[C in EtOH with HCl gas presumably would yield similarly β-chloropropionaldehyde diethylacetal (3:9490) q.v., although such direct forms. has not actually been reported.] Behavior with NaOAc/AcOH. [C with NaOAc/AcOH on htg. ppts. NaCl and gives (1) (by loss of HCl) some acrolein (1:0115) and (as a result of the HCl) some trimer (see above).

Behavior with acetic anhydride. [C with Ac₂O (1:1015) refluxed several hrs. gives (1) a mixt. of prods. including α -chloroallyl acetate, allylidene diacetate, β -chloropropylidene diacetate, m.p. 43°, and the trimer of \tilde{C} .]

Behavior with RMgX reactants. [C with RMgX cpds. in ether, followed by hydrolysis, reacts normally by addn. to the aldehyde group; e.g., C with EtMgBr gives (3) 1-chloropentanol-3 [Beil. I₁-(184), I₂-(421)], b.p. 173° at 760 mm., C with excess n-AmMgBr gives (43% yield (4)) 1-chloro-octanol-3, b.p. 110-115° at 14 mm. (4)

3:5585 METHYL CHLOROACETATE CH₂.COOCH₃ C₃H₅O₂Cl Beil. II - 197
$$H_{1-}$$
(88) H_{2-} (191) B.P. F.P. 131.5° (1) -32.65 ° (1) $D_{4}^{20} = 1.2358$ (6); $n_{D}^{20} = 1.42207$ (6) 131° (2) 1.2340 (8) (8) 130.8° (3) 130.0° at 760 mm. (4) 130.0° at 740 mm. (5) 129.6–129.8° at 756 mm. (6) 129° (7)

[For prepn. of \bar{C} from chloroacetic acid (3:1370) with MeOH (43-45% yield (2)), with MeOH + HCl (68.5% yield (2)) (5) (9), with MeOH + BF₃.Et₂O (65% yield (2)), or with Me₂SO₄ in s.t. at 200° (10) see indic. refs.; from chloroacetyl chloride (3:5235) + MeOH see (7); from chloroacetamide + MeOH +BF₃ (64% yield) see (2); from α,β -dichlorovinyl ethyl ether (3:5540) with MeOH see (11) (12).]

[For constant-boilg. mixts. of \bar{C} with various org. cpds. see Beil. II₂-(191) or (13) (14).] \bar{C} on shaking with 2 vols. cold conc. NH₄OH yields (7) (16) (more readily (15) than ethyl chloroacetate (3:5700)) chloroacetamide, m.p. 121° (16). — \bar{C} on htg. with 2 moles aniline at 100°, extracted with aq. to remove aniline hydrochloride, yields an oil which on steam distillation gives in the distillate (7) methyl anilinoacetate (phenylglycine methyl ester) [Beil. XII-470, XII₁-(263)], m.p. 48° (7). [This prod. on boilg. with excess aniline yields (7) anilinoacetanilide (phenylglycine anilide) [Beil. XII-556], m.p. 110-111° (7).

 \bar{C} on hydrolysis (probably best with N/10 Ba(OH)₂ cf. (17)) yields methyl alc. (1:6120) and chloroacetic acid (3:1370). [For studies of hydrolysis under various conditions see (18) (19); for study of alcoholysis of \bar{C} with EtOH + HCl see (20).]

3:5590 1,3-DICHLORO-2-METHYLPROPENE-1
$$C_4H_6Cl_2$$
 Beil. I -209 $(\alpha,\gamma$ -Dichloroisobutylene) Cl CH_3 Cl I_1 — I_2 — CH_2 — CH I_3 — I_4 — I_4 — I_5

Note: \bar{C} by virtue of allylic transposition may frequently yield derivatives of its synionic isomer, 1,1-dichloro-2-methylpropene-2 (3:7480) q.v. The products (and/or their deriva-

tives) formerly (4) regarded as cis and trans stereoisomers of C may very probably be C and its synionic isomer (3:7480).

[For prepn. of \bar{C} from 1,2,3-trichloro-2-methylpropane (3:5885) by dehydrochlorination with quinoline (73-85% yield) see (7).]

[For prepn. of \tilde{C} from 1,1-dichloro-2-methylpropene-2 (3:7480) by htg. under reflux see (2): for formn. of \tilde{C} (together with other products) from 2-methylpropene-1 (isobutylene) (60% yield (5)) (1) + Cl₂, or from 3-chloro-2-methylpropene-1 (isobutenyl chloride) (3:7145) with Cl₂ (1 mole) + NaHCO₃ (1.5 moles) at 0° (2) see indic. refs.; for formn. of \tilde{C} (20% yield (6)) (together with other products) from 1,3-dichloro-2-methylpropanol-2 (3:5977) + strong oxygen acids see (6); for formn. of \tilde{C} (46% yield (3)) from 1,3-dichloro-2-methylpropanol-2 (3:5977) by htg. with P₂O₅ for 2 hrs. at 110-115° see (3).]

 \bar{C} on hydrolysis with aq. + CaCO₃ (2) (4) or aq. + MgO (4) gives (2) (3) (46% yield (4)) 1-chloro-2-methylpropen-1-ol-3 (3-chloro-2-methylallyl alc.) (3:8340) q.v.

C with O₃ followed by hydrolysis yields (2) (3) (5) chloroacetone (3:5425).

C treated with Cl₂ in the dark at 0° for 37 hrs. yields (4) 1,1,2,3-tetrachloro-2-methyl-propane (3:6165) + other products.

 \bar{C} with cuprous cyanide refluxed 9-10 hrs. gives (67% yield (7)) 4-chloro-3-methylbuten-3-nitrile-1, b.p. 70-73° at 10 mm., $D_4^{20}=1.0856$, $n_D^{20}=1.4643$ (7); this product on hydrolysis with hot conc. HCl for 2 hrs. gives (7) 4-chloro-3-methylbuten-3-oic acid-1, m.p. 35° (corresp. phenylhydrazide, m.p. 147-148°).

3:5590 (1) Pogorshelski, J. Russ. Phys.-Chem. Soc. 36, 1129-1184 (1904); Cent. 1905, I 668, (2) Tishchenko, J. Gen. Chem. (U.S.S.R.) 8, 1232-1246 (1938); Cent. 1939, II 4223; C.A. 33, 4190 (1939). 3:5605 3,3,3-TRICHLORO-2-METHYLPROPENE-1 $C_4H_5Cl_3$ Beil. S.N. 11 (1,1,1-Trichloro-2-methylpropene-2) $H_2C=C-CCl_3$

B.P. 132° (1) $D_{-}^{20} = 1.293$ (1) $n_{-}^{20} = 1.479$ (1)

Note: \tilde{C} readily undergoes allylic transposition so that in reactns. of \tilde{C} products derived from the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) may be expected (1) (2) (3) (4).

[For prepn. of $\bar{\rm C}$ (yield: 30–43% (4), 15% (1)) from β,β,β -trichloro-ter-butyl alc. ("Chlore-tone") (3:2662) by htg. to 200° with P₂O₅ and dimethylaniline (1) or quinoline (4) see indic. refs.] [A 57% yield of the isomeric 1,1,3-trichloro-2-methylpropene-1 (3:5025) together with some α -chloroisobutyric acid (3:0235) is separated from $\bar{\rm C}$ by redistillation (1).]

 \bar{C} on hydrolysis by boilg. 1 day with aq. Na₃PO₄ gives (60% yield (2)) 3,3-dichloro-2-methylpropen-2-ol-1, b.p. 78-79°, $D_{-}^{20}=1.298, n_{-}^{20}=1.493$ (p-nitrobenzoate, m.p. 91°, N-phenylcarbamate, m.p. 64° (2)).

 \bar{C} on htg. with NaOAc + AcOH gives (2) 3,3-dichloro-2-methylpropen-2-yl acetate, b.p. 79° at 12 mm., D_{-}^{20} = 1.257, n_{-}^{20} = 1.4718 (2). [With boilg. NaOH this regenerates the corresp. alc. (2).]

Č with NaOEt gives in the cold 70% yield (2) of 3,3-dichloro-2-methylpropen-2-yl ethyl ether, b.p. 56° at 12 mm., $D_{-}^{20} = 1.1285$, $n_{-}^{20} = 1.4610$ (2).

 \bar{C} in AcOH treated with O₃, then hydrolyzed, gives (70% yield) α,α,α -trichloroscetone (3:5620), b.p. 133-134⁵ (1).

[For behavior of C with PCl₅, with HF, or with HF + anisole see (4).]

- ② 2,3-Dibromo-1,1,1-trichloro-2-methylpropane: m.p. 34° (1). [From $\ddot{C} + Br_2$ without solvent; crude prod. recrystd. from alc. at -10° (1); cf., however, (4).]
- 3,3-Dichloro-2-methylpropen-2-yl p-nitrobenzoate: m.p. 91° (2). [From C on boilg. with dil. alc. soln. of K p-nitrobenzoate (2).]

at 10 mm. (2)

3:5625 ETHOXALYL CHLORIDE
$$\begin{array}{c} \text{CO.OC}_2\text{H}_5 \\ \text{CO.Cl} \end{array}$$
 $\begin{array}{c} \text{C}_4\text{H}_5\text{O}_3\text{Cl} \\ \text{II}_1\text{-}(234) \\ \text{II}_2\text{-}(508) \end{array}$ B.P. 136–138° (1) $D_4^{20} = 1.2234$ (2) 1.35–136° (2) 1.2226 (3) 1.34–135° (4) 1.33–135° at 760 mm. (14) 30° at 10 mm. (2)

Colorless mobile liq. with penetrating odor. — C fumes in air and gradually deposits hydrated oxalic acid (1:0445) (17). — C as such is insol. in aq. but rapidly hydrolyzes with formn. of HCl and ethyl hydrogen oxalate, the latter in turn being converted to oxalic acid (1:0445) + EtOH.

[For prepn. of C from diethyl oxalate (1:1055) with PCl₅ (yields: 80–90% (5), 84% (6), 80% (7)) (8) (9) (10) (11) (34) see indic. refs.; note that this mode of prepn. has been shown (4) to comprise two distinct and successive reactions: first the formn. of ethyl α,α -dichloro- α -ethoxyacetate, Cl₂C (OEt).COOEt [Beil. II-543, II₁-(236)], b.p. abt. 85° at 10 mm., $D_4^{20} = 1.23155$ (2); and second, the pyrolysis of this product by repeated distillation (13) or increased temp. (especially in the pres. of catalysts such as salts of Fe or Pt (5) (12)) yielding \tilde{C} + ethyl chloride (3:7015).]

[For prepn. of \bar{C} from ethyl hydrogen oxalate [Beil. II-535, II₁-(232), II₂-(504)] with SOCl₂ (yields: 78% (14), 72% (15)) or with PCl₅ (3) see indic. refs. (note that the initial ethyl hydrogen oxalate is readily obtd. from anhydrous oxalic acid (1:0535) with diethyl oxalate (1:1055) by htg. 3 hrs. (32% yield (15)) (18) or by distn. with EtOH and CCl₄ as directed (61% yield (16))); for prepn. of \bar{C} from K ethyl oxalate with POCl₅ or PCl₅ (17) (3) or with SOCl₂ (60-70% yield (24)) see indic. refs. (note that K ethyl oxalate can readily be prepd. in 95-97% yield from diethyl oxalate (1:1055) by digestion with aq. KOAc (24).)

[For prepn. of \tilde{C} from oxalyl (di)chloride (3:5060) with EtOH (1:6130) by reactn. of one acid chloride group but not the other (60% yield) see (25).]

[\bar{C} on passing through tube at 200° loses CO yielding (19) ethyl chloroformate (3:7295).] [\bar{C} with EtOH (1:6130) reacts normally yielding (17) diethyl oxalate (1:1055); for reactn. of \bar{C} with cellulose see (25).]

[C with diethyl sodiomalonate in ether gives (20) (12) a mixt. of triethyl oxalomalonate [Beil. III-850, III₁-(292)] and tetraethyl dioxalomalonate [Beil. III₂-(199)]; C with ethyl sodio-cyanoacetate in ether gives (21) (22) diethyl oxalo-cyanoacetate [Beil. III-850], m.p. 98° (22), 96° (21); C with diethyl methyl sodio-malonate gives (23) diethyl oxalomethyl-malonate; many other analogous condensations cannot be included here.]

 $|\bar{C}|$ with aromatic hydrocarbons in the pres. of AlCl₃ undergoes reactn. of the Friedel-Crafts type, and this procedure has been widely studied as a means of introduction of the —CO.COOEt group: e.g., \bar{C} with C_6H_6 + AlCl₃ in nitrobenzene + CS₂ gives (26) ethyl benzoylformate (ethyl phenylglyoxylate) [Beil. X-657, X₁-(314)], b.p. 256-257°; for corresp. analogous reactn. with toluene (1:7405) (27), m-xylene (1:7420) (27), cumene (1:7440) (9), pseudocumene (1:7470) (27), or mesitylene (1:7455) (27) (1) see indic. refs.]

Č with NH₃ in alc. gives (17) ethyl oxamate, NH₂.CO.CO.OC₂H₅ [Beil. II-544, II₁-(236), II₂-(509)], lfts. from hot alc., m.p. 114°. — Similarly Č with aniline should yield ethyl oxanilate, C₆H₅.NH.CO.CO.OC₂H₅ [Beil. XII-282, XII₁-(206)], tbls. or pr. from alc., ndls. from hot aq., m.p. 66-67°; Č with phenylhydrazine should yield β-(ethoxalyl)-phenylhydrazine, C₆H₅.NH.NH.CO.CO.OC₂H₅ [Beil. XV-264], lfts. from alc., m.p. 119°.

Č with urea (2 moles) reacts vigorously at room temp. as a normal acid chloride yielding (28) ethyl oxalurate, NH₂·CO.NH.CO.CO.OC₂H₅ [Beil. III-65, III₂-(54)], ndls. from ether, m.p. 184–185°.— Note, however, that Č with N-phenylurea on htg. evolves CO + C₂H₅Cl (3:7015) and yields (29) a mixt. of ethyl ω-phenylallophanate, C₆H₅·NH.CO.NH.-COOC₂H₅ [Beil. XII-359, XII₁-(234)], ndls. from boilg. alc., m.p. 106° (30), and N-phenyl-parabanic acid (oxalyl N-phenylurea) [Beil. XXIV-454, XXIV₁-(405)], lfts. from alc., m.p. 208° (29).— Č with N,N'-diphenylurea in C₆H₆ on htg. evolves C₂H₅Cl (3:7015) and yields (29) N,N'-diphenylparabanic acid (oxalyl N,N'-diphenylurea) [Beil. XXIV-455, XXIV₁-(405)], ndls. from alc., m.p. 204°.— Č with N,N'-dimethylurea (2 moles)

reacts vigorously giving (80% yield (31)) N,N'-dimethylparabanic acid [Beil. XXIV-453, XXIV₁-(404)], m,p. 154°.

[Č with RMgX cpds. gives (32) disubstituted glycolic acids ($R_2C(OH)COOH$) and/or ethoxalyl esters of disubstituted ethyl glycolates, $R_2C(O.CO.COOC_2H_5)$; similarly \bar{C} with diethylcadmium gives (63% yields (33)) ethyl α -ethyl- α -hydroxy-n-butyrate (ethyl α , α -diethylglycolate).]

Colorless liq.; for constant-boilg. mixt. of \bar{C} with various org. cpds. see Beil. II₂-(191) or (4) (15) (16). — [For insecticidal actn. see (17); for use in refining of mineral oil see (18).]

[For prepn. of \bar{C} from chloroacetic acid (3:1370) with EtOH + dry HCl gas (10) cf. (72.5% yield '(22)) or H₂SO₄ (70% yield (23)) (19) or anhydrous MgCl₂ (20) see indic. refs.; from chloroacetyl chloride (3:5235) with EtOH (5) or with triethyl orthoformate (1:3241) at 100-110° (90% yield (21)) see indic. refs.; from α,β -dichlorovinyl ethyl ether (3:5540) with org. acids see (24) (25).]

[For formn. of \bar{C} from ethyl hydroxyacetate (ethyl glycolate) with PCl₅ see (26); from ethyl ammoacetate hydrochloride with NaNO₂ + excess HCl see (27); from ethyl diazoacetate with HCl (27) (28) or with HgCl₂ (70% yield (11)) see indic. refs.; from dichloroacetaldehyde monoethyl hemiacetal (3:5310) with alc. KCN at 20° (38% yield) see (29); from ethyl α -chloroacetoacetate (3:6207) with diethyl sodiomalonate see (30).]

 \bar{C} refluxed with KF yields KCl + ethyl hydroxyacetate (+ some ethyl fluoroacetate) (31); \bar{C} with MgI₂ in ether (32) or KI in alc. (3) (34) or in acetone at ord. temp. (35) yields ethyl iodoacetate, b.p. 180°. [For studies on rate of reactn. of \bar{C} with KI in acetone see (36) (37) (38); with NaI or LiI in acetone see (38).]

[\tilde{C} with Al/Hg + a trace of alc. (39) or with Mg + trace of I₂ in ether (40) or \tilde{C} with Mg + trace HgCl₂ in ether (41) yields ethyl γ -chloroacetoacetate (3:6375), b.p. 205°; \tilde{C} with NaCN (25) or KCN (42) yields ethyl cyanoacetate; \tilde{C} with ethyl sodioacetoacetate gives (56-62% yield (23)) diethyl acetosuccinate.]

[Č with 2 moles MeMgBr (but not MeMgI) in ether gives (yield: 60% (43), 38% (44)) 1-chloro-2-methylpropanol-2 (3:7752) (note, however, that Č with a large excess MeMgBr (4 moles) gives (40% yield (45)) 2-methylbutanol-3 (1:6170) (3,5-dinitrobenzoate, m.p. 74-75°)): for reactn. of Č with EtMgBr yielding (46) 3-(chloromethyl)-pentanol-3 [Beil. I-412], with isopropyl MgCl (47), or with phenyl MgBr (3 moles) yielding (48) chloromethyl-diphenyl-carbinol [Beil. VI-685] see indic. refs.]

[For use of \tilde{C} with Zn (or Zn + Cu (49)) + ketones to give by Reformatsky reactn. (50) β -hydroxy-esters see indic. refs.]

 \tilde{C} treated with aq. benzenediazonium chloride + NaOAc gives (15% yield (6)) ethyl γ -chloro- β -phenylhydrazono-acetoacetate, m.p. 92-93° (6).

Č with Me₃N in abs. alc. followed by treatment with 100% hydrazine hydrate as directed (51) (52) gives 83–89% yield (51) betaine hydrazide hydrochloride, (CH₃)₃N(Cl).CH₃--

CO.NH.NH₂ (Girard's reagent for ketones), m.p. 192°. [For corresp. reactn. using pyridine instead of Me₂N see (52).]

Č shaken in cold with 2 vols. conc. aq. NH₄OH gives (53) (54) (28) (29) (78-84% yield (55)) chloroacetamide, cryst. from aq., m.p. 119-120° (55), 120° (28). — Č htd. at 100° for ½ hr. with 2 moles aniline, cooled, aniline hydrochloride extracted with aq. gives (100% yield (56)) (57) (58) ethyl anilinoacetate (phenylglycine ethyl ester) [Beil. XII-470, XII₁-(263)], cryst. from dil. alc. (56) (57) or lgr. (58), m.p. 58° (58), 57-58° (57), 57° (56). [This prod. on boilg. with excess aniline yields (57) anilinoacetanilide (phenylglycine anilide) [Beil. XII-556], m.p. 110-111° (57).] — Č htd. with aq. benzylamine yields (59) chloroacet-N-benzylamide, m.p. 93.0-93.6° cor. (59).

[Č with ethyl carbamate ("urethane") + Na in dry ether as directed gives (51-57% yield (66)) triethyl N-tricarboxylate = N(COOC₂H₅)₃ [Beil. III-28], b.p. 146-147° at 12 mm. (66).]

C h.d. as directed (60) with K tetrachlorophthalimide yields N-(carbethoxymethyl)-tetrachlorophthalimide, ndls. from CHCl₃ on pouring into 2 vols. MeOH, m.p. 180-181° (60); C with Na phthalimide yields (61) N-(carbethoxymethyl)phthalimide, m.p. 112-113° (61); C with K 3-nitrophthalimide yields (62) N-(carbethoxymethyl)-3-nitrophthalimide, ndls. from alc., m.p. 79-80° (62).

 \bar{C} on hydrolysis (e.g., by boilg. 10 min. with N/10 aq. Ba(OH)₂ (14)) yields ethyl alcohol (1:6130) and chloroacetic acid (3:1370). [For studies on the kinetics of hydrolysis of \bar{C} under various conditions see Beil. II₂-(191-192) and (2) (14) (63) (64) (65).]

3:5710 1,1,2-TRICHLORO-2-METHYLPROPANE CH₃
$$C_4H_7Cl_3$$
 Beil. I - 126 CH_3 CH_5 CH_5 CH_5 CH_5 CH_7 CH_7

B.P. M.P.
$$-6.5$$
 to -6.0° (1) $D_4^{25} = 1.2712$ (1) $145-146^{\circ}$ at 762 mm. (2) $n_D^{20} = 1.4666$ (1) $n_D^{20} = 1.4666$ (1)

[For prepn. (together with other products) from ter-butyl chloride (3:7045) + Cl_2 see (1); for formn. (32%) (together with 68% 3,3-dichloro-2-methylpropene-1) from 1-chloro-2-methylpropene-1 (3:7120) with Cl_2 + NaHCO₄ at 0° see (2).] [The product described in Beil. I-126 was very impure (1).]

Č on further chlorination yields (1) 1,1,1,2-tetrachloro-2-methylpropane (3:4725), m.p. 179°.

Č on prolonged refluxing with dil. NaOH loses ½ of its chlorine (1) but the reactn. products were not characterized.

3:5725 1,4-DICHLOROBUTENE-2 Cl Cl C₄H₆Cl₂ Beil. S.N. 12 H₂C—CH=CH—CH₂
B.P. 145° (1)
$$n_{\rm D}^{30.5} = 1.4745$$
 (1) 75-76° at 40 mm. (1)

For this structure two geom, stereoisomers are theoretically possible but only Č (configuration undetermined) is known.

[For prepn. of \bar{C} together with other products) from butadiene-1,3 with Cl_2 , either directly or in CHCl₃, CS_2 , or lgr. soln. see (1) (2); the process can be controlled so as to yield little or no 1,2,3,4-tetrachlorobutane but rather a mixt. of \bar{C} and 1,2-dichlorobutene-3 (3:5350) in the ratio 1:2 (1) (2): for prepn. of \bar{C} from 1,2-dichlorobutene-3 (3:5350) via allylic transposition in pres. of metal halide cat. (3) such as AlCl₃ (4) see (3) (4).]

Č does not (1) rearr. to 1,2-dichlorobutene-3 (3:5350) even on htg. at 90° in a s.t.

C on htg. at 90° with 2 pts. solid KOH loses HCl yielding (1) 1-chlorobutadiene-1,3 (3:7210), b.p. 85° (1).

C on htg. in alc. with Zn dust yields (1) butadiene-1,3.

 \bar{C} with Cl_2 yields mainly (1) the solid form (m.p. 72°) of 1,2,3,4-tetrachlorobutane (3:1760).

 \ddot{C} on oxidn. with dil. alc. KMnO₄ or with O₃ followed by aq. gives (1) chloroacetic acid (3:1370).

Note: Care must be taken not to confuse \bar{C} with tetrachloroethylene (3:5460) or with 1,1,1,2-tetrachloroethane (unsym.-acetylene tetrachloride (3:5555)).

Colorless liq. with odor similar to that of chloroform. — [For vapor press. of C at intervals over range 20–145° see (25); for study of thermal conductivity see (26).]

 \tilde{C} is very spar. sol. aq.: e.g., 100 g. H_2O at 20° dis. 0.288 g. \tilde{C} ; at 55-56° dis. 0.336 g. \tilde{C} (27); 1 g. \tilde{C} is sol. at 25° in 350 g. aq. (101); for soly. of H_2O in \tilde{C} at 0°, 25°, and 30° as

detd. by Karl Fischer reagt. see (28). — \bar{C} is easily volatile with steam (for use in detn. of H₂O see below).

MISCELLANEOUS PHYSICAL PROPERTIES

[For soly. in \bar{C} of dry gaseous HCl (14) (15), H₂S (14), or O₂ (29) see indic. refs.; for soly. in \bar{C} at 11-25° of I₂ (30) and use of such solns. in detn. of iodine number (31) see indic. refs.; for adsorption by activated carbon of I₂ from solns. in \bar{C} see (32).]

[For study of influence of vapors of \bar{C} on the explosion limits of mixtures of air with hydrogen (33), acetylene (33), methane (33) (34) (35), or carbon monoxide (33) (36) see indic. refs.]

[For prepn. of and comparison with \bar{C} of sym.-dideuteroiotetrachloroethane, $Cl_2C(D)$.- $C(D)Cl_2$, see {9}.]

Binary systems contg. $\bar{\mathbb{C}}$. [For f.p./compn. data and/or diagrams on systems $\bar{\mathbb{C}}$ + 1,2-dichloroethane (ethylene dichloride) (3:5130) (18); $\bar{\mathbb{C}}$ + 1,1,2-trichloroethane (3:5330) (18); $\bar{\mathbb{C}}$ + pentachloroethane (3:5880), eutectic, f.p. -73°, contg. 40.1% $\bar{\mathbb{C}}$ (18); $\bar{\mathbb{C}}$ + cis-dichloroethylene (3:5042) (37); $\bar{\mathbb{C}}$ + trans-dichloroethylene (3:5028) (37); $\bar{\mathbb{C}}$ + p-dichlorobenzene (3:0980) (38); $\bar{\mathbb{C}}$ + 1,2-dibromoethane (ethylene dibromide) (18); $\bar{\mathbb{C}}$ + 1,1,2,2-tetrabromoethane (acetylene tetrabromide) (18); $\bar{\mathbb{C}}$ + succinonitrile (18); or $\bar{\mathbb{C}}$ + succinic acid (1:0530) (18) see indic. refs. — For study of system $\bar{\mathbb{C}}$ + naphthalene (1:7200) at 30° under press. up to 1000 atm. see (39).]

 \bar{C} with various org. cpds. forms binary azeotropes [e.g., \bar{C} with anhydrous formic acid (1:1005) forms a const.-boilg. mixt., b.p. 99.25° at 760 mm., contg. 32 wt. % \bar{C} (40): note that \bar{C} with AcOH (1:1010) does not form a const.-boilg. mixt. (41) (the data listed by "Int. Crit. Tables" for such an azeotrope is actually for the mixt. AcOH + tetrachloroethylene); \bar{C} with propionic acid (1:1025) forms a const.-boilg. mixt., b.p. 140.4° at 760 mm., contg. abt. 40 wt. % \bar{C} (12); for other azeotropes see Beil. II₂-(56). — Note that no record of forms. of azeotropes of \bar{C} with MeOH or EtOH can be found.]

Ternary systems contg. \tilde{C} . [For soly. data and diagrams of system \tilde{C} + acetone (1:5400) + aq. see (43).]

USES OF C

Č is widely used in industry as a solvent and as an intermediate in the manufacture of various other chlorinated solvents, notably trichloroethylene (3:5170); for additional examples of special uses see also below.

 $\bar{\mathbf{C}}$ is frequently employed as solvent in certain types of Friedel-Crafts reactions or phthalic anhydride condensations [for study of use of $\bar{\mathbf{C}}$ as solvent in Friedel-Crafts condensation of phenol with high-mol.-wt. acyl chlorides see (44)].

[For use of \tilde{C} as swelling agent for rubber (45), in prod. of films from rubber hydrochloride (46), in prod. of cellulose acetate by pptn. from \tilde{C} with hydrocarbons (47) (note that acetylcelluloses give with \tilde{C} crystalline addition prods. (48)), together with aliphatic monohydric alcs. as solv. for cellulose alkyl ethers (49), in prepn. of transparent cellulose acetate plastics (50) see indic. refs. — For soly. of various polymers in \tilde{C} see (56).]

[For use of \bar{C} as catalyst in condensation of phenol with formaldehyde (51) or furfural (52) see indic. refs.]

[For use of \bar{C} with petroleum naphtha as a dry-cleaning fluid (53), for use of \bar{C} as a rust remover (54), as means of removing mud barriers in oil wells (55), or as an immersion fluid in opt. crystallog. (21) see indic. refs.]

[For use of \bar{C} (57) (58) or stable aq. emulsions of \bar{C} (59) as weed killers see indic. refs.] [For studies of use of \bar{C} in detn. of the observation in cacao see (60) (61) (62) (63).] [For use of \bar{C} as anti-moth prod. (64), as a component of insecticides (65), together with

CS₂ and chlorobenzene (3:7903) as insecticide (66), or together with 20% trichloroethylene (3:5170) as a fumigant and insecticide (67) see indic. refs.]

[For studies on antiseptic, bactericidal, and disinfectant action of C see (68) (69) (70).]

 \bar{C} is also employed for the detn. of H_2O by distillation; note that besides being non-inflammable \bar{C} is also much denser than water which for some applications of this method is advantageous. — [For general discussion and examples of this procedure see (226) (70) (71) (72) (73) (74) (75); for comparison of results with those obtd. by oven drying see (76); for application to detn. of H_2O in liquid and solid fuels (77) (78), in glycerol (79) (80), in liquid glue (81), in cereal (82), in dried apples (83), in cooking salt (84) see indic. refs.]

TOXICITY AND PHYSIOLOGICAL ACTION OF C

 \bar{C} is the most toxic of the group of chlorinated hydrocarbons (85) and produces marked pathological alterations in gastrointestinal tract, liver, and kidneys. — [Detailed discussion of this aspect of \bar{C} is beyond the scope of this treatment except to cite references (229) (227) (232) and (85)-(99), incl. (note that articles on this topic prior to 1930 are omitted).] [For discussion of fate of \bar{C} in body see (100). — Note also that \bar{C} (in sharp contrast to

the closely related tetrachloroethylene (3:5460)) has no efficacy as anthelmintic for hook-worms (101).]

[For actn. of C on alc. fermentation see (102) (103); for actn. on invertase see (104).]

DETERMINATION OF C

Some methods for the detn. of \bar{C} involve conversion of all of its halogen to chloride ion and subsequent volumetric or gravimetric detn. of the latter; e.g., for methods based on initial pyrolytic decomposition see (105) (89) (106) (107); for methods based on dehalogenation of \bar{C} with Na + ethanolamine in dioxane see (108) (230) (note that use of Na in liq. NH₃ causes some cyanide formn. (109)). — For detn. of \bar{C} by means of elimination of 1 HCl with cold alc. KOH see (110). — For detn. of \bar{C} by means of the Fujiwara color reactn. with NaOH/pyridine see (111). — Note that \bar{C} does not respond to the R + H "Tri-Per-Analyzer" (a recording ultra-violet photometer) (112). — For further comments on detection of \bar{C} see below under color tests.

PREPARATION OF C

 $\bar{\mathbf{C}}$ is one of a large family of "chlorinated solvents" now available from industrial sources. — The most-studied method of prepn. is that from acetylene by controlled addition of chlorine, although variants of this method are employed and other starting prods. (see below) are sometimes used. — $\bar{\mathbf{C}}$ is also obtained as a by-prod. of the manufacture of the comml. mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes, cis (3:5042) and trans (3:5028), 1,1,2-trichloroethane (3:5330), etc.

From acetylene by addition of chlorine. Under suitable controls to avoid explosion and with the assistance of a wide variety of catalysts \bar{C} is manufactured from acetylene by reaction with Cl₂. — [For a concise review of the general nature and difficulties of this general method see (113).]

[For important general articles on this synthesis see (114)-(122) incl. — For examples of patents employing this method see refs. (123)-(138) incl.; for special test of Ger. 204,833 (131) see (118) (120); for test of Ger. 154,677 (133) see (119) (120).]

From acetylene by other means. [For prepn. of \bar{C} from acetylene with excess SbCl₅ (139) (234) with SbCl₃ + SbCl₅ (140), with NOCl (4 moles) at 350° (141), with aq. NaOCl soln. (142), with S₂Cl₂ + Fe powder in cold (143) (144) see indic. refs.]

From ethylene. [For formn. of \bar{C} from ethylene + Cl₂ (as by-prod. of prepn. of ethylene chlorohydrin (3:5552)) (145), from ethylene + Cl₂ (as by-product of prepn. of 1,1,2-trichloroethane (3:5330)) (146) (147), from ethylene + Cl₂ (as by-prod. of a three-part process for combined prepn. of \bar{C} + ethyl chloride) (198) see indic. refs.

From dichloroethylenes. [For prepn. of C from cis-dichloroethylene (3:5042) in vapor phase at 95° in light of 4360 Å with Cl₂ (in absence of O₂) (149), or in liq. phase with SO₂Cl₂ (1½ moles) in pres. of trace of dibenzoyl peroxide refluxed 3 hrs. in dark (85% yield (150)), see indic. refs.]

[For prepn. of \bar{C} from trans-dichloroethylene (3:5028) in vapor phase at 80-95° in light of 4358 Å with Cl₂ see (151).]

[For prepn. of \bar{C} from ord. mixt. (3:5030) of both stereoisomeric dichloroethylenes with Cl₂ (13) in light of 4360 Å (152) see indic. refs.]

From trichloroethylene. [For formn. of \bar{C} (together with other prods.) from trichloroethylene (3:5170) + AlCl₃ + HCl gas at 50° see (153).]

From 1,2-dichloroethane (ethylene (di)chloride). [For prepn. of \bar{C} from ethylene (di)chloride (3:5130) with Cl₂ (148) in u.v. light see (154).]

From miscellaneous starting points. [For formn. of \bar{C} usually together with other prods. from dichloroacetaldehyde (3:5180) with PCl₅ (1), from " β -chlorovinyl iodochloride" (ClCH—CH.ICl₂) on warming (16), from 1,1,2-trichloro-2-iodoethane on distn. at ord. press. (155), from 1,2-di-iodoethylene with Cl₂ (156), or from 1,1,2-trichloroethane (3:5330) with Cl₂ + AlCl₃ at 70-80° (231) see indic. refs.]

STABILIZATION OF C

[For patents on stabilization of \bar{C} by addition of small amts. of phenols, aminophenols, etc. (157), or by addn. of less than 0.1% alkylamines (158) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis without catalyst. \bar{C} on protracted reflux (20 days (159)) or techn. \bar{C} on repeated distn. (160) leaves a residual high-boilg. fraction ("Tetranachlauf") consistings mainly of 1,1,2,3,4,4-hexachlorobutane (3:3155), ndls. from alc., m.p. 107° (159) (160), presumably formed by elimination of 1 Cl atom from each of 2 moles of \bar{C} .— $[\bar{C}$ htd. in s.t. at 300° for 15 hrs. yields (139) trichloroethylene (3:5170); \bar{C} in s.t. at 360° for 100 hrs. yields (139) hexachlorobenzene (3:4939).]

Pyrolysis in pres. of various catalysts or HCl acceptors. \bar{C} on suitable htg. particularly in the pres. of dehydrohalogenating catalysts or acceptors of the hydrogen chloride formed loses 1 mole HCl yielding trichloroethylene (3:5170). (For elimination of HCl by chemical means such as alk., NH₃, etc., see below.)

[E.g., \bar{C} over pumice at 700° (161), over pumice contg. Cu₂(PO₄)₃ at 450-500° (162), over ThO₂ below 390° (163) cf. (164), over BaCl₂ at 300° (165), over bone char at 300-310° (166), over activated carbon at 200-300° (167), 260° (168) (note yield diminishes with increasing temp. (233)) or 500° (169), or over suitable cat. (148) loses HCl yielding trichloroethylene (3:5170). — Note also that pure \bar{C} on long exposure to u.v. light loses HCl bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.]

[\bar{C} + acetylene over cat. at 250° loses HCl yielding (167) trichloroethylene (3:5170) + vinyl chloride (3:7010); \bar{C} with MeOH over Al₂O₃ at 280° loses HCl yielding (170) trichloroethylene (3:5170) + methyl chloride (3:7005).]

Dehydrogenation. [C with air over pumice contg. CuCl₂ at 430-450° (171), or with Cl₂ over activated carbon contg. CuCl₂ at 300-320° (172), or with hexachloroethane (3:4835) over cat. at 200-400° (173) loses its two hydrogenations yielding tetrachloroethylene (3:5460).]

(Partial) dehalogenation. [\tilde{C} with H_2 over Ni at 300-320° (174), or \tilde{C} with Fe or Al + aq. (175) (176) or Zn + aq. (176) (177), or \tilde{C} with acetylene over hydrogenating cat. (such as Ni) on activated carbon at 350° (178) preferably in pres. of aq. vapor (179) or on electrolytic reductn. in pres. of ZnCl₂ (235) (236) loses 1 chlorine from each carbon atom yielding a mixt. (3:5030) of the two stereoisomeric 1,2-dichloroethylenes. — Note that \tilde{C} with Zn in alc. yields (180) acetylene.]

Oxidation. [C with air in ultra-violet light yields (181) (182) dichloroacetyl chloride (3:5290) (or in pres. of aq. dichloroacetic acid (3:6208)), accompanied by small amts. of oxalic acid and an octachlorobutane, m.p. 81°. (Note also that pure C on long exposure to u.v. light loses HCl bimolecularly yielding (159) 1,1,2,3,4,4-hexachlorobutene-2 (3:1945), m.p. 80°.)]

[For behavior of C with CrO₃/H₂SO₄ (183) or over hot CuO (184) see indic. refs.]

BEHAVIOR WITH HALOGENS

Fluorination. [$\bar{\mathbf{C}}$ with F₂ gas at 50° for 14 hrs. gives (185) 1-fluoro-1,1,2,2-tetrachloro-ethane, b.p. 115.5-116.5°, $D_4^{20}=1.6218$, $D_D^{20}=1.4487$, and 1,2-difluoro-1,1,2,2-tetrachloro-ethane, b.p. 92-93°, m.p. 24-25°, together with various other prods. — For fluorination of $\bar{\mathbf{C}}$ with SbF₃ + SbCl₅ see (186)).]

Chlorination. [\bar{C} with Cl₂ (139) in CCl₄ soln. (187), in u.v. light (188) or X-radiation (189), or over activated carbon at 300-400° (190) (191), or in liq. phase at 60-70° (192), or with Fe at 20-80° (192), or with AlCl₃ at 20-100° (192), or under reflux at 120° (80% yield (193)), or \bar{C} with anhydr. FeCl₃ on htg. in s.t. (194), or even \bar{C} with aq. bleaching powder (192) yields hexachloroethane (3:4835).]

BEHAVIOR WITH H2SO4

Č with fumg. H₂SO₄ (65% SO₃) in pres. of H₂SO₄ at 50-60° readily gives (198) (yields: 70-73% (195), 32% (196), 30% (197)) glyoxal sulfate, O₂SO₂CH—CHO₂SO₂, [Beil. I₂-(818)], ndls. from ClSO₃H, m.p. 176-177° (198), ndls. with 1 AcOH, m.p. 121-122° from AcOH, the solv. of crystn. being lost completely in vac. over NaOH (199).

BEHAVIOR WITH ALKALINE REACTANTS

 \bar{C} under influence of many alk. reactants loses 1 mole HCl; this reacta. is used for the manufacture of trichloroethylene (3:5170) (see also above under pyrolysis of \bar{C}) and also by titration of the HCl or estimation of chloride ion formed as a diagnostic test for \bar{C} (see below).

Č on htg. with aq. alk. or alk. carbonates (200) in pres. of tetraethylene glycol as promoter (228) or with aq. Ca(OH)₂ or alk. carbonates (200) (201) (234) (114) (for test of Ger. 171,900 (200) see (202) (120)), or Č with alc. KOH (203) cf. (122) or alc. NaOEt (203), loses 1 mole HCl yielding trichloroethylene (3:5170); note that in use of alc. alkali, distn. gives the const.-boilg. mixt. of EtOH with trichloroethylene, b.p. 70-71°, from which latter is separated by washing with aq. and subsequent drying over CaCl₂ (203).

Č with EtOH/NaOH or EtOH/NaOEt (204) cf. (205), or Č with 1 N EtOH/KOH in xylene (110), instantly and quant. splits out 1 HCl at room temp.; note that this does not occur with cis-dichloroethylene (3:5042), trans-dichloroethylene (3:5028), trichloroethylene (3:5170) or tetrachloroethylene (3:5460), chloroform (3:5050), or carbon tetrachloride (3:5100), but does occur in analogous fashion with pentachloroethane (3:5880) (110).—
[For rate of reactn. of Č with KOH in 95% EtOH at 90° see (206).]

Note, however, that C in acetone with excess standard alk. refluxed 3 hrs., then residual alk. titrated back, uses 5 equivalents of alk. (207); this surprising result is presumably to

be attributed to hydrolysis of \bar{C} to glyoxal followed by disproportionation of latter to sodium glycolate: cf. (208).

Č with solid KOH on htg. yields (203) dichloroethylene (3:5030), trichloroethylene (3:5170), tetrachloroethylene (3:5460), together with a spontaneously inflammable gas which may be chloroacetylene (3:7000). — Č with anhyd. KOH in xylene at 80° under N₂ gives (209) a little dichloroacetylene (3:5010) (may be carried out as a lecture experiment (209)).

BEHAVIOR OF C WITH NH3 AND AMINES

[\overline{C} with excess NH₃ gas in pres. of aq. (210), or with aq. NH₄OH htd. under press. (210) (120), or with liq. NH₃ at -40° (211) (212), or with dry pyridine on reflux (182) loses HCl giving (yields: 92% (211) 92-96% (210)) trichloroethylene (3:5170).]

[\bar{C} htd. with aniline + aq. Ca(OH)₂ at 140-190° under press. yields (213) a mixt. of the calcium salt of N-phenylglycine and N-phenylglycine anilide, cf. (122); since this reaction really involves conversion of \bar{C} by loss of HCl to 1,1,2-trichloroethylene (3:5170) and reactn. of latter with aniline see 3:5170 for details.]

 \bar{C} with excess phenylhydrazine on stdg. at ord. temp. evolves N₂, ppts. phenylhydrazine hydrochloride, and yields C₆H₆ (110); the full mechanism of this behavior seems never to have been established, but the same three prods. are also similarly obtd. from pentachloroethane (3:5880) and hexachloroethane (3:4835).

[For rate of reactn. of Č with piperidine in 95% EtOH at 90° see (206).]

BEHAVIOR OF C WITH METALS

[For survey of action of \bar{C} on various common metals (214) (215) in pres. of moisture (223) see indic. refs.]

Č with Na or K or their alloys may (like many other polychloro compounds) explode under certain conditions [for extensive studies of this behavior including sensitivity to mechanical shock see (216) (217)].

BEHAVIOR OF C WITH METAL SALTS

[C with AlCl₃ at 110° undergoes partial rearr. (218) to the isomeric 1,1,1,2-tetrachloroethane (3:5555). — C with freshly prepared anhyd. AlBr₃ on htg. below b.p. of C yields (219) 1,1,2,2-tetrabromoethane (acetylene tetrabromide) [Beil. I-94, I₁-(30), I₂-(66)].

C with N/15 AgNO₃ in 95% EtOH shows no reactn. even after 12 hrs. at 90° (206) cf. (80).

MISCELLANEOUS

[\bar{C} does not react with excess Hg di-p-tolyl (220). — \bar{C} with excess C_6H_5MgBr yields 1,1,2,2-tetraphenylethane [Beil. V-739, V_1 -(371), V_2 -(673)] (221) cf. (222).]

COLOR REACTIONS OF C

With cyclopentanol (1:6412). Č (1 drop) with cyclopentanol (2 ml.) + trace solid NaOH, boiled 25 secs., cooled, acidified with AcOH or 85% H₂SO₄, stood 1 min., shaken gives (224) green color. [Note that this same response is also shown by 1,1,2-trichloroethylene (3:5170) but not by methylene dichloride (3:5020), CHCl₃ (3:5050), CCl₄ (3:5100), ethylene dichloride (3:5130), pentachloroethane (3:5880), cis-(3:5042) or trans- (3:5028) 1,2-dichloroethylene, or tetrachloroethylene (3:5460); for sensitivity for C see (224).]

With pyridine + NaOH (Fujiwara reagt.) [For detn. of \bar{C} with Fujiwara reagt. see (111); for relative sensitivity of Fujiwara reagt. to \bar{C} as compared to CHCl₃ (3:5050),

CCl₄ (3:5100), 1,1,2-trichloroethane (3:5330), trichloroethylene (3:5170), and tetrachloroethylene (3:5460) see (100).

With NH₄OH/CuCl. Note that C with NH₄OH/CuCl does not give blue color within 5 min. (225) (dif. from pentachloroethane (3:5880) q.v.).

3:5750 (1) Paterno, Pisati, Gazz. chim. ital. 1, 463-464 (1871); J. prakt. Chem. (2) 4, 175-178 (1871). (2) Mathews, J. Am. Chem. Soc. 48, 569 (1926). Colorless when pure, but slightly brown if distilled at ord. press. — Sol. in 12 pts. aq., vol. with steam; miscible with alc. or ether. — Solid is very hygroscopic.

Č is an important pharmaceutical. — [Although full consideration of its pharmacology is beyond the scope of this text, for studies and reviews of this aspect see (11) (12) (13) (14) (40).] — Č in the organism is in part excreted (15) (16) as urochloralic acid [Beil. I-620].

PREPARATION OF C

Č is readily obtd. from trichloroacetaldehyde (chloral) (3:5210) by various types of reducing actions which are able to effect reduction of the aldehyde group without serious interference with the halogen atoms.

By use of various alcoholates. [For prepn. of \bar{C} from chloral (3:5210) with Al(OEt)₃ in abs. EtOH (yields: 85% (17), 84% (3), 80% (18)) (6) (10) (19) cf. (23) see indic. refs.; with Al isopropylate in isopropyl alc. (20) in pres. of acetaldehyde (yield 72-87% (21)) see indic. refs.; with C_2H_5OMgBr (9), (CH₃)₂CHOMgBr (9), or other metallic isopropylates (22) see indic. refs.]

By use of RMgX. [For form. of Č from chloral (3.5210) during reaction with MeMgBr (24), with EtMgBr (25) (4), with iso-AmMgBr (4), with cyclohexyl MgBr (26), and various other RMgBr cpds. (7) (25) (yields: 65% (25), 50-60% (4), 42-52% (26)) see indic. refs.]

By use of metal alkyls. [For formn. of \tilde{C} from chloral (3:5210) by use of ZnEt₂ (2) (27) or AlEt₃ cpd. with ether (88.5% yield (8)) see indic. refs.; note, however, that SnEt₄ is not (8) effective.]

By phytochemical agents. [For prepn. of \tilde{C} from chloral (3:5210) by reduction with fermenting yeast see (28) (5).]

By misc. methods. [For form. of \bar{C} from urochlorate acid [Beil. 1-620] by hydrolysis with dil. mineral acid see (1); for form. of \bar{C} in small amts, from EtOH + Cl_2 see (29).]

CHEMICAL BEHAVIOR OF C

WITH INORGANIC REACTANTS

Oxidation. \bar{C} reduces Fehling's soln. on warming (2). — \bar{C} with fumg. HNO₃ is oxidized to trichloroacetic acid (1) (2).

Behavior with alkalies. [\bar{C} in conc. aq. NaOH first dissolves then gives a white ppt. of Na deriv. (33). — \bar{C} with aq. KOH dissolves and soon afterward reacts vigorously yielding (2) various prods. including chloroacetic acid (3:1370), β,β,β -trichloroethoxyacetic acid [Beil. III-233], m.p. 69.5° (2), and formic acid (1:1005).]

Behavior with inorganic acid chlorides. [$\bar{\mathbb{C}}$ with PCl₃ evolves HCl and yields (27) tris- $(\beta,\beta,\beta$ -trichloroethyl) phosphite, b.p. 263°, no formation of 1,1,1,2-tetrachloroethane (3:5555) being evident. — $\bar{\mathbb{C}}$ with PCl₅ at 140° evolves HCl yielding (27) tris- $(\beta,\beta,\beta$ -trichloroethyl) phosphate, m.p. 73–74° (sublimes without decn.) accompanied by a trace of 1,1,1,2-tetrachloroethane (3:5555).]

[Č with SOCl₂ gives (30) bis- $(\beta,\beta,\beta$ -trichloroethyl) sulfite, b.p. 139.5-140° at 5 mm., m.p. 6-7°. — Č with SO₂Cl₂ in pyridine at 100° gives (30) bis- $(\beta,\beta,\beta$ -trichloroethyl) sulfate, m.p. 118.5-119.5° cor., also obtd. (30) by oxidn. of the preceding sulfite with acid KMnO₄ in acetone.]

Behavior with AlBr₃. [\tilde{C} with AlBr₃ in CS₂ (31) (32) undergoes replacement of chlorine by bromine yielding acc. to conditions β -bromo- β , β -dichloroethanol, m.p. 17.5 (32), m.p. 17.5° (32), or β , β -dibromo- β -chloroethanol, m.p. 50°, b.p. 80° at 8 mm. (32).]

WITH ORGANIC REACTANTS

(See also below under derivatives.) — [\bar{C} with diazomethane in heptane (33), n-BuOH (34), or acetone (33) (but not in ether (33)), yields β,β,β -trichloroethyl methyl ether, b.p. 35-36° at 16 mm. (33).]

[Č with 2,3-dichlorodioxane-1,4 (3:9105) gives (50% yield (18)) 2-chloro-3- $(\beta,\beta,\beta$ -trichloroethoxy)dioxane-1,4, m.p. 77-78°.]

[\ddot{C} with BEt₃ at 150° evolves C₂H₆ and gives (44% yield (8)) β,β,β -trichloroethyl diethylborate, CCl₃CH₂OB(C₂H₅)₂, b.p. 78-79° at 12 mm. (8).]

- β,β,β -Trichloroethyl acetate: oil, b.p. 167° sl. dec. at 736 mm. (2), 71° at 18.3 mm. (2), 88–91° (35), $D_D^{28} = 1.4239$ (35), $n_D^{28} = 1.4691$ (35). [From \bar{C} with AcCl in s.t. at 130° for several hrs. (2).]
- —— β,β,β-Trichloroethyl benzoate: oil (29). [Note, however, that no constants are reported in the literature.]
- \mathfrak{D} β,β,β -Trichloroethyl *m*-nitrobenzoate: m.p. 75° (29) (26). [From $\tilde{\mathbb{C}}$ + *m*-nitrobenzoyl chloride + aq. alk. (29).]
- \mathfrak{D} β,β,β -Trichloroethyl p-nitrobenzoate: m.p. 71° (28) (25). [From $\tilde{C}+p$ -nitrobenzoyl chloride + aq. alk. (28).]
- \mathfrak{D} β,β,β -Trichloroethyl 3.5-dinitrobenzoate: m.p. 142-143° (25).
- $\[\widehat{\mathbf{D}} \]$ β,β,β -Trichloroethyl carbamate: m.p. 64-65° (28) (36) (37) (38), 64° (39). [From $\[\widehat{\mathbf{C}}\]$ (1 mole) with carbamyl chloride (1 mole) in dry ether (28) (note that $\[\widehat{\mathbf{C}}\]$ with excess of carbamyl chloride gives (28) β,β,β -trichloroethyl allophanate, m.p. 182-183°), or from $\[\widehat{\mathbf{C}}\]$ by treatment with phosgene (3:5000) followed by NH₃ (37). Note that this prod. comprises the hypnotic pharmaceutical known as "Voluntal." It also forms molecular cpds. with various other pharmaceuticals; e.g., "Voluntal," m.p. 64-65° + pyramidone (2,3-dimethyl-4-dimethylamino-1-phenyl-pyrazolone-5) [Beil. XXV-452, XXV₁-(672)], m.p. 108°, give a 1:1 mol. cpd., m.p. 75-76°, known as "Compral"; for f.p./compn. data and diagrams on this (and similar systems) see (39).]
- β,β,β -Trichloroethyl N-phenylcarbamate: m.p. 87° (39). [For f.p./compn. data and diagrams of this prod. (also known as N-phenylvoluntal) with antipyrine, etc., see (39).]
- \oplus β,β,β -Trichloroethyl N-(α -naphthyl)carbamate: m.p. 120° (7), 119° (26). [From $\bar{C} + \alpha$ -naphthyl isocyanate at 120–135° for 2 hrs. (7).]

3:5780 β -CHLOROETHYL CHLOROFORMATE $C_3H_4O_2Cl_2$ Beil. III - 11 $(\beta$ -Chloroethyl chlorocarbonate) ClCH₂.CH₂.O.CO.Cl III₁— III₂-(10)

B.P. 152.5° at 752 mm. (1) $D_4^{20} = 1.3825$ (1) $n_D^{20} = 1.4465$ (1)

Colorless lachrymatory liq. which fumes in air. — Insol. aq., eas. sol. alc., ether. [For prepn. from β -chloroethanol (ethylene chlorohydrin) (3:5552) + phosgene (3:5000) see (1).]

 $\bar{\mathbf{C}}$ on slight warming with quinoline dec. at $41-42^{\circ}$ into ethylene dichloride (3:5130) + \mathbf{CO}_{2} (2).

 \tilde{C} is readily hydrolyzed by warm aq. or dil. alk. to β -chloroethanol (3:5552) + CO₂ + HCl (1).

- \oplus β -Chloroethyl carbamate: from $\ddot{C}+2$ moles conc. aq. NH₄OH; m.p. 76° (3) (4) (5). [The value of 115° given in Beil. III-11 is wrong (5).]
- Φ β-Chloroethyl N-phenylcarbamate: from C in C₆H₆ added to C₆H₆ soln. of aniline (2 moles); after filtering off the pptd. aniline hydrochloride, the C₆H₆ is evapd. (6); white ndls., m.p. 51° (3). [This deriv. on short boilg. with dil. aq. or alc. alk. loses HCl and by ring closure yields 3-phenyloxazolidone-2 [Beil. XXVII-136], lfts. from alc., m.p. 124° (3), 122° (7).]
- Φ β-Chloroethyl N-p-tolycarbamate: white ndls. from C₆H₆, m.p. 45° (6). [On treatment with alk. this gives 3-(p-tolyl)oxazolidone-2, white ndls. from alc., m.p. 91° (6).]
- \mathfrak{D} β -Chloroethyl phenylcarbazate: from $\tilde{\mathbb{C}}$ on treatment with 1 mole phenylhydrazine in aq. pyridine; the red oil initially formed soon solidifies and is recrystd. from \mathbb{C}_0H_6 ; white ndls., m.p. 89° (8).

Low-boiling b.P. 146.3° at 746 mm. (1) $D_4^{25} = 1.1623$ (1) $n_D^{35} = 1.4573$ (1) $D_4^{25} = 1.1720$ (1) $n_D^{25} = 1.4617$ (1) $D_4^{20} = 1.1769$ (1) $n_D^{20} = 1.4638$ (1)

Colorless liquids; both stereoisomers possess a delayed vesicant actn., and care should be taken in handling them.

[For prepn. of \bar{C} from 1,3-dichloropropene-1 (γ -chloroallyl chloride) (3:5280) by hydrolysis for 2 hrs. under reflux with aq. 10% Na₂CO₃ (10% excess over 1 equiv.) see (1); note that the high-boiling stereoisomer of γ -chloroallyl chloride gives (76% yield) of the high-boiling \bar{C} , and that the lower-boilg. stereoisomer of γ -chloroallyl chloride gives (81% yield) the lower-boiling stereoisomer of \bar{C} (1).—Note that from γ -chloroallyl acetate (which was presumably a mixture of the acetates of both stereoisomers of \bar{C}) by hydrolysis with cold aq. NaOH \bar{C} (presumably a mixt. of stereoisomers) has been reported (2).]

The two stereoisomers of \tilde{C} behave differently with hot aq. NaOH (1): the higher-boilg, stereoisomer fails to give any propargyl alcohol but some acetylene and sodium formate are formed; the lower-boiling stereomer on refluxing with aq. 12.5% NaOH (10% excess) for 3 hrs. gives (by dehydrochlorination) 69% yield of propargyl alcohol (propyne-1-ol-3) [Beil. I-454], b.p. 114-115° (for study of influence of NaOH concn. and time see (1)).

 \mathfrak{D} γ -Chloroallyl N-phenylcarbamate: ndls. from pet. ether, m.p. 75° (2). [From $\tilde{\mathbb{C}}$ + phenyl isocyanate (note, however, that the $\tilde{\mathbb{C}}$ employed very probably was a mixt. of the two stereoisomers (2).]

 \bar{C} with Cl_2 in CCl_4 in sunlight adds halogen almost quant. (19) yielding (17) (18) (20) meso- α,α' -dichlorosuccinyl dichloride (3:9087). — \bar{C} adds Br_2 at 150° (2) or in CCl_4 in sunlight (20) yielding alm. quant. (19) meso- α,α' -dibromosuccinyl dichloride, b.p. 113° at 18 mm. (20) (this prod. hydrolyzes with aq. to meso- α,α' -dibromosuccinic acid, m.p. 257-258° in s.t. (20).

[Č with 1,4-diphenylbutadiene-1,3 yields (10) 3,6-diphenyltetrahydrophthaloyl dichloride, colorless ndls. from lgr., m.p. 143-144° cor. (10); this prod. on long bollg. (7½ hrs.) with aq. alc. NaOH gives (10) on acidif. 3,6-diphenyltetrahydrophthalic acid, ndls. from AcOH, m.p. 230-231° cor. dec. (10).]—[For color reactns. of C with various polyenes see (21).]

[\bar{C} on htg. at 100° with AlCl₃ is partially conv. to maleyl dichloride accompanied by evolution of HCl + CO (22). — \bar{C} with AlCl₃ + C₆H₆ gives (yield: 78-83% (23), 74% (24)) trans-α,β-dibenzoylethylene (1,4-diphenybuten-2-dione-1,4), cryst. from C₆H₆ by addn. of alc., pale yel. ndls., m.p. 109-110° (23).] [For corresp. reactn. of \bar{C} + AlCl₃ with toluene (24) (25), chlorobenzene (24), mesitylene (24), anisole (24), m-xylene (25), and biphenyl (25) see indic. refs.]

 \bar{C} with excess MeOH yields (8) dimethyl fumarate (1.2415), m.p. 101.7°. (Note, however, that \bar{C} with 1 equiv. MeOH in C_6H_6 stood 5 hrs. at room temp. (5) or in ether (26) yields fumaric methyl ester chloride, b.p. 83° at 17 mm. (26), 76° at 22 mm. (5), m.p. 16° (5); this on shaking with aq. gives alm. quant. (5) methyl hydrogen fumarate, cryst. from C_6H_6 , m.p. 144.5° cor. (5).

 \bar{C} with phenol (6) or with sodium phenolate in C_6H_6 (28) yields diphenyl fumarate, ndls. from alc., m.p. $161-162^\circ$ (6); note, however, that the half ester, phenyl hydrogen fumarate, has m.p. 130° (28).

Č with aq. readily hydrolyzes yielding fumaric acid (1:0895), m.p. abt. 293-295° subl.; for the diamide, dianilide, and other derivs. corresp. to Č see fumaric acid (1:0895).

Beil. I - 87

C2HCl5

See also Note 1.

Colorless liquid with odor suggesting chloroform. — C is widely used in industry as solvent, degreasing agent, dry cleaner, component of insecticides, etc. - Note that comml. Č is likely to contain other prods., notably tetrachloroethylene (3:5460) q.v.

Č is very spar. sol. aq.; e.g., 1 g. Č requires for soln. at 25° 2900 g. aq. (19): for study of soly. of C in aq. at 20° see (20); for study of soly. of aq. in C at 0°, 25°, and 30° as detd. by Karl Fischer reagt. see (21).

Binary systems contg. \bar{C} . For f.p./compn. data on systems $\bar{C} + 1.2$ -dichloroethane (ethylene dichloride) (3:5130), eutectic, f.p. -62° , contg. about 56 wt. % \overline{C} (22); \overline{C} + 1,1,1-trichloroethane (methylchloroform) (3:5085), eutectic, f.p. -69.0° contg. 72.3% \ddot{C} (14); $\ddot{C} + 1,1,2,2$ -tetrachloroethane (acetylene tetrachloride) (3:5750), eutectic, f.p. -73° . contg. 59.9 wt. % \bar{C} (22); \bar{C} + tetrachloroethylene (3:5460), eutectic, f.p. -54.8° , contg. 41.6% \bar{C} (14); \bar{C} + CCl_4 (3:5100), eutectic, f.p. -68° (82), \bar{C} + CBr_4 (82) see indic. refs.

C forms binary azeotropes with various org. cpds.; e.g., C with chloroacetic acid (3:1370) forms a const.-boilg. mixt., b.p. 158.65° at 760 mm., contg. 90.1 wt. % $\bar{\mathrm{C}}$ (23); $\bar{\mathrm{C}}$ with trichloroacetic acid (3:1150) forms a const.-boilg. mixt., b.p. 161.8° at 760 mm., contg. 96.5 wt. % C (24). — For other examples see Beil. I₂-(57).

Č either as liquid or vapor is extremely toxic; for further details see (83) (25) (26) (27) (28) (29); for extensive study of anthelmintic action see (19).

[For study of soly. in C of gaseous HCl (30) (11), H₂S (30), or NH₃ (30) see indic. refs.: for study of thermal conductivity of C see (31); for study of influence of vapors of C on

the explosion limits of mixtures of air with hydrogen, carbon monoxide, methane, acetylene, etc., see (32) (33) (34) (35).]

Preparation of C. [For prepn. of C from chloral (3:5210) with PCl₅ (7) (37) or with AlCl₃ (38) see indic. refs.; note that in latter case (38) presence of AlCl₃ also facilitates loss of HCl from C with consequent formn. of tetrachloroethylene (3:5460); from triehloroethylene (3:5170) by addn. of Cl₂ in aq. (39) or under influence of ultra-violet light (40) (41) (note that O₂ retards addition of halogen (41)), or with S₂Cl₂ in s.t. at 140-150° (42), see indic. refs.]

[For form. of \bar{C} (together with various other by-products) from ethyl chloride (3:7015) (43) or from 1,2-dichloroethane (ethylene dichloride) (3:5130) (44) with Cl₂ see indic. refs.; from chloroform (3:5050) in electric arc (45) or in dark electric discharge (46) see indic. refs.; from CCl₄ in dark elec. discharge see (46); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) or from trichloroethylene (3:5170) with Cl₂ at 80°, 95°, or 115° in ultra-violet light (41), over pumice at 700° (47), or with FeCl₃ on htg. in s.t. (48) see indic. refs.; from trichloroethylene (3:5170) with large excess Cl₂O in CCl₄ at -20° see (10); from β,β' -dichlorodiethyl sulfide ("mustard gas") with dry Cl₂ at 100° see (49).]

[For stabilization of \bar{C} by addn. of not over 0.1% alkyl amines such as Et₃N (50) or with a wide variety of other org. N cpds. (81) see indic. refs.]

[For studies of detn. of \tilde{C} by reactn. with Na + ethanolamine in dioxane (51) followed by volumetric (51) or gravimetric (71) detn. of resultant chloride ion see indic. refs. (note that use of Stepanov's method (Na + EtOH) for detn. of Cl in \tilde{C} gives low results unless after addn. of Na mixt. is refluxed at least 20 hrs. (12)); for detn. of \tilde{C} by thermal decn. and subsequent detn. of chlorine see (52).]

Chemical behavior of \bar{C} . $[\bar{C}$ with dry Cl₂ at 70° in diffuse light does not react and even after 30 hrs. no HCl is formed (52); however, \bar{C} with dry Cl₂ + AlCl₃ at 70° (53), or \bar{C} + Cl₂ over activated charcoal at 300-400° (54), yields hexachloroethane (3:4835).]

[\bar{C} with F_2 at 90° over a 10-hr. period yields (8) a mixt. of prods. contg. fluoropenta-chloroethane, m.p. 99.8–110° (in s.t.) (b.p. 137–139°), hexachloroethane (3:4835), tetra-chloroethylene (3:5460), sym.-difluorotetrachloroethane, b.p. 91–92°, together with other materials. — For behavior of \bar{C} with SbF₃ see (55).]

 \bar{C} with $K_2Cr_2O_7/H_2SO_4$ is only partially oxidized to CO_2 (56). — [\bar{C} on photochem. oxidn. with O_2 in ultra-violet light (57) (58) gives a mixt. consisting of 80% trichloroacetyl chloride (3:5420) + 20% phosgene (3:5000). — \bar{C} with fumg. H_2SO_4 (60% SO_3) at 50–60° yields (59) dichloroacetyl chloride (3:5290).]

Č under various circumstances loses HCl yielding tetrachloroethylene (3:5460) [e.g., Ĉ over bone char at 280° (60) or over NiCl₂ at 330° (61), or with AlCl₃ at 70° (53) or under reflux (95% yield (72)) (62), or with liq. NH₃ at −18 to −34° under reduced press. (63) (64), or with prim. or sec. aliph. amines (84), or with MeOH over Al₂O₃ at 290° (methyl chloride (3:7005) is also formed) (65), or with acetylene over cat. at 200–300° (vinyl chloride (3:7010) is also formed) (68), or with alc. KOH (44) (66), or in alc. with 2 N aqueous NaOH in cold (98% yield (12)) gives tetrachloroethylene (3:5460). — For detn. of Č by titration of chloride ion thus split off see (67); for study of kinetics of reactn. of Č with EtOH/NaOH see (12).]

Č under certain conditions yields trichloroethylene (3:5170) [e.g., Č with H₂ over Ni at 270° (61), or Č on electrolysis at Pb cathode (69), or Č with MeMgI (70) gives trichloroethylene (3:5170).]

[Č with CHCl₃ (3:5050) + AlCl₃ gives (72) (73) (74) (75) unsym.-heptachloropropane (3:0200); note that this reactn. first involves loss of HCl under influence of AlCl₃ (see also above) and subsequent condensation of the resultant tetrachloroethylene (3:5460)

with CHCl₃. — \tilde{C} (1 mole) + 1,2-dichloroethylene (presumably mixt. of cis (3:5042) and trans (3:5028) stereoisomers) + AlCl₃ (1% of sum of wts. of reactants) stood 12 days at 40° gives (76) (in addition to a residue a fraction volatile with steam which consists of 1,1,2,2,3,4,4-heptachlorobutane (3:9056)), two stereoisomeric 1,1,2,3,4-pentachlorobutanes, viz., the solid isomer (3:0750) and the liquid isomer (3:9068); for genesis of these compds. see (76).]

[For survey of actn. of \bar{C} on various common metals see (77). — \bar{C} with Na or K or their alloys may (like many other polychloro compds.) explode under certain conditions; for an extensive study of this behavior including sensitivity to mechanical shock see (78).]

- Č with excess phenylhydrazine on stdg. at ord. temp. evolves N₂, ppts. phenylhydrazine hydrochloride, and yields benzene (67); the full mechanism of this behavior seems never to have been established, but these same three prods. are similarly obtd. from hexachlorocthane (3:4835) and to a lesser degree from 1,1,2,2-tetrachlorocthane (3:5750).
 - D Color test with NH₄OH/Cu₂Cl₂. \bar{C} (1-2 drops) in small glass-stoppered bottle filled with conc. aq. NH₄OH treated with powdered Cu₂Cl₂, stopper quickly inserted (to force out air and excess liq.) and shaken, gives within 5 mins. a blue color which rapidly darkens; note that this test is not specific for \bar{C} and is also shown by other cpds. contg. the —CCl₃ group such as trichloroacetic acid (3:1150), ethyl trichloroacetate (3:5950) CHCl₃ (3:5050), CCl₄ (3:5100), although hexachloroethane (3:4835) develops color at surface only after several hours; for further details see {79}.

Oily liq.

164-165°

163-164°

[For prepn. of \bar{C} from acetaldehyde (1:0100) (3) (7) or paraldehyde (1:0170) (7) (8) with Cl_2 see indic. refs.; from α -chlorocrotonaldehyde (3:8117) by addn. of Cl_2 (6) (10) (36) in CCl_4 soln. (9); from crotonaldehyde (1:0150) by satn. with HCl gas followed by treatment with Cl_2 see (11) cf. (37).]

[For prepn. of \tilde{C} from its polymers (see below) by distn. at atmospheric press. (2), or from its hydrate (3:1905) by distn. with half its wt. of Ac₂O (2), or shaking with conc. H₂SO₄ (1) cf. (2), see indic. refs.]

 $[\bar{C}$ on reduction with fused Al(OEt)₃ in boilg. abs. alc. under H₂ or N₂ for 14 hrs. (12) or with fused Al(OEt)₃ + AlCl₃ in boilg. abs. alc. under H₂ or N₂ for 14 hrs. (13), or with C₂H₅OMgBr in dry ether followed by aq. (19), or by treatment with diethylzinc (14), di-n-propylzinc (15), or di-isobutylzinc (15) (followed by aq.) gives (92% yield (12)) 2,2,3-trichlorobutanol-1 (3:1336), m.p. 62°.—Note that \bar{C} (as hydrate) (3:1905) is reduced by fermenting yeast (16) to dextrorotatory 2,2,3-trichlorobutanol-1, m.p. 62°.]

[\bar{C} with Zn + HCl or Zn + aq. (17) is dehalogenated to a mixt. of α -chlorocrotonaldehyde (3:8117) + crotonaldehyde (1:0150); \bar{C} with Fe filings + AcOH at room temp. for 8 days (18) dehalogenates to a mixt. of n-butyraldehyde (1:0130) + n-butyl alc. (1:6180) + crotonyl alc. [Beil. I-442, I₁-(227), I₂-(480)].]

 \bar{C} on oxidn. with 2 pts. fumg. HNO₃ stood overnight at ord. temp. yields (3) α,α,β -trichloro-n-butyric acid (3:1280) (cf. corresp. behavior of butyrchloral hydrate (3:1905)). — \bar{C} on oxidn. with boilg. aq. K₄Fe(CN)₅ also loses 2 atoms of chlorine giving (41% yield (29)) α -chlorocrotonic acid (3:2760).

 \bar{C} (1 mole) with H_2O (1 mole) readily combines with evolution of heat yielding (3) (9) crystn. butyrchloral hydrate (3:1905). — Similarly, \bar{C} combines with equiv. amt. of alcohols giving the corresp. alcoholates: e.g., \bar{C} with EtOH yields (20) butyrchloral-ethylalcoholate [Beil. I-665, I_1 -(346)]; \bar{C} with butanol-2 yields (1) butyrchloral-sec-butylalcoholate, etc. — Note that butyrchloral-ethylalcoholate in excess EtOH on satn. with dry HCl gas gives (50% yield (21)) α,α,β -trichloro-n-butyraldehyde diethylacetal, b.p. 232-233°, 135° at 30 mm. (21). — [For study of dissociation of addn. cpds. of \bar{C} with various prim., sec., and ter. alcohols see (22).]

 \tilde{C} or its hydrate (3:1905) q.v. in pres. of conc. H_2SO_4 or pyridine at ord. temp. can be trimerized to a mixt. of two parabutyrchlorals (2); these are colorless, crystalline, sharp melting solids, sol. in org. solvents but insol. in aq.; the less sol. α -parabutyrchloral, rhombic cryst. from boilg. AcOH or boilg. EtOH, has m.p. 180°; the more soluble β -parabutyrchloral (stereoisomer?), cryst. from boilg. AcOH or boilg. EtOH, has m.p. 157°; these polymers can be distilled at 15 mm., but attempts to distill them at ord. press. result in complete dissociation to \tilde{C} (2).

[Č with anhydrous acetaldehyde (1:0100) (2 moles) with dry HCl gas at 0° for 15–20 hrs. condenses to give (67% yield (23)) 2,4-dimethyl-6- $(\alpha,\alpha,\beta$ -trichloro-n-propyl)trioxane-1,3,5, b.p. 118° at 13 mm. (23).]

[Č in CHCl₈ with H₂S gives (24) bis- $(\alpha$ -hydroxy- β , β , γ -trichloro-n-butyl)sulfide ("butyr-chloralsulfhydrate"), m.p. 85° (24).]

[C with PCl₅ (1.4 wt. pts.) at 110-120° apparently has its oxygen replaced by equivalent chlorine but also loses 1 HCl yielding (25) a cpd. of compn. C₄H₂Cl₄, presumably 1,1,2,3-tetrachlorobutene-2, although no other report of this cpd. can be found.]

[Č with aq. HCN gives only butyrchloral hydrate (3:1905) since this prod. is too spar. sol. aq. to enter further reaction, but upon addn. of alc. and subsequent digestion this system yields (26) (27) α,α,β -trichloro-n-butyraldehyde cyanohydrin [Beil. III-322, III₂-(226)], pl. from aq., m.p. 101-102° (27) (28), also obtd. from butyrchloral hydrate with aq. KCN (2 moles) at 40° (28). — See also further comments under butyrchloral hydrate (3:1905).]

[\bar{C} with ethyl diazoacetate gives (71% yield (30)) ethyl β -keto- γ,γ -trichloro-n-caproate [Beil. III-684], b.p. 149° at 20 mm. (30).]

Č in CHCl₃ with NH₃ gas gives on evapn. of solvent (31) butyrchloralammonia, cryst., m.p. 62° [see also under butyrchloral hydrate (3:1905)].

Č also readily adds amides yielding cpds. of type CH₃.CHCl.CH₂CH (OH).NH.CO.R; e.g., Č with acetamide (1 mole) gives on htg. (31) (32) (33) (34) butyrchloralacetamide, obtd. by these workers in two isomeric forms one of m.p. 170° (spar. sol. hot alc.) (32) (33) (34), the other m.p. 158° (readily sol. in hot 50% alc.) (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with acetamide (1 mole) htd. at 100° until solidification occurs gives only (21) a prod. m.p. 208−210°; Č with benzamide (1 mole) gives on htg. butyrchloralbenzamide, obtd. in two isomeric forms, one of m.p. 146° (32) (33) cf. (34), the other of m.p. 132° (31) (32) (33); note, however, that butyrchloral hydrate (3:1905) with benzamide yields only (21) a prod. m.p. 176°.

Č (3.5 g.) with urea (1.2 g.) htd. at 100°, cooled, powdered and recrystd. from alc., gives (yield not stated (35)) butyrchloralurea, m.p. 156°.

[For prepn. of \tilde{C} from trichloroacetic acid (3:1150) with abs. EtOH + dry HCl (yield: 90% (13), 53% (16)) or with H₂SO₄ (50-60% yield (13)) (14) (15), or with Twitchell's reagt. (62.6% yield (5)) see indic. refs.; from trichloroacetyl chloride (3:5420) with ethyl orthoformate (1:3241) see (17); from "tetrachloroethylidene trichlorolactate" [Beil. XIX-105] with EtOH see (12); for formn. of \tilde{C} from chloral (3:5210) with Al(OEt)₃ in C₆H₆ (11), or with acetaldehyde + Al(OEt)₃ or Mg(OMe)₂ in dry ether (18), see indic. refs.]

[$\tilde{\mathbf{C}}$ on warming with KCN in abs. alc. dec. (6) into chloroform (3:5050) + CO₂; $\tilde{\mathbf{C}}$ with NaOEt gives on warming (19) triethyl orthoformate (1:3241) + Na ethyl carbonate + NaCl.]

[\overline{C} with excess H₂ over Ni at 320° gives {14} ethyl dichloroacetate (3:5850) + ethyl chloroacetate (3:5700) + EtOAc (1:3015) + acetaldehyde (1:0100).]

Č with Cu₂Cl₂ in conc. aq. NH₄OH gives dark blue color within 2 min. (21); also shown by chloral hydrate (3:1270) and trichloroacetic acid (3:1150) (the latter, however, acting instantly); for further limitations see (21). [Č htd. at 100° with Cu powder for 6-8 hrs. (22) gives diethyl tetrachlorosuccinate, b.p. 156° at 13 mm. (22).]

Č with conc. aq. NH₄OH gives in the cold (14) trichloroacetamide, spar. sol. aq., cryst. from hot aq. or dil. alc., m.p. 141°. — Č on shaking with aq. benzylamine gives in the cold (23) trichloroacet-N-benzylamide, cryst. from lgr., m.p. 93.6-94.4° cor. (23). [Note, however, that the corresp. dichloroacet-N-benzylamide (from ethyl dichloroacetate (3:5850) has almost the same m.p., viz., 94.8-95.6° cor. (23), while chloro-acet-N-benzylamide (from ethyl chloroacetate (3:5700)) has m.p. 93.0-93.6° cor. (23).]

Č hydrolyzes very readily (5) yielding ethyl alcohol (1:6130) and trichloroacetic acid (3:1150). [For kinetic studies of hydrolysis of Č under various conditions (including very high pressure (9)) see (10) (2) (24); for kinetic study of alcoholysis of Č with MeOH+HCl see (25).]

$$d,l-1,1,1$$
-TRICHLOROBUTANOL-2 $C_4H_7OCl_3$ Beil. I — (Ethyl-trichloromethyl-carbinol) H Cl I_1 — I_2 -(403) CH_3 . CH_2 — C — Cl OH Cl I_2 -(403) I_2 -(403) I_3 — I_4 -(403) I_4 -(403) I_5 -(

Oil. — Eas. sol. MeOH, EtOH, ether, acetone, C₆H₆, CHCl₃, CCl₄, CS₂. [Note that b.p. of 99° at 680 mm. (4) may be a typographical error (1).]

[For prepn. of \bar{C} from chloral (3:5210) via conversion with diazomethane to 3,3,3-trichloro-1,2-epoxypropane (3:1336) and reactn. of latter with 1 N LiMe in dry ether at -75° (yield 85%) see (1); from chloral (3:5210) with EtMgBr (4) (5) or EtMgI (2) in ether (yields: 44% (4), 16% (2), 15% (5)) see indic. refs. (note, however, that by virtue of reducing acta. of EtMgX large amounts of 2,2,2-trichloroethanol-1 (3:5775) are also formed (5) (2) (1)); from chloral (3:5210) with PbEt₄ (20% yield (6)) (note, however, that this could not be confirmed (1)), from trichloroacetyl chloride (3:5420) with EtMgBr at 10° see (3).]

 \bar{C} with conc. HCl + ZnCl₂ (Lucas' reagent) stood for 1 hr. at room temp. gives (1) 1.1.1,2-tetrachlorobutane (3:5622).

 \tilde{C} with 5% soln. of Na₂CO₃ in 50% aq. alc. refluxed for 10 hrs. (1) or \tilde{C} with aq. KOH, NaOH, Na₂CO₃, Ba(OH)₂, Mg(OH)₂, CaCO₃, etc., (2) undergoes both hydrolysis and hydrolytic cleavage giving respectively α -hydroxy-n-butyric acid [Beil. III-302, III₁-(114), III₂-(216)] (yields: 46% (1), 21% (2)), m.p. 43°, and propionaldehyde (1:0110) (29% yield (2)).

- Ethyl-trichloromethyl-carbinyl acetate: b.p. 164-165° at 680 mm. (4). [From C with Ac₂O at 130-135° for 2 hrs. (4). Note that in light of subsequent work (1) the identity of this prod. has been questioned.]
- Ethyl-trimethyl-carbinyl benzoate: b.p. 217-218° at 680 mm. (4). [From $\bar{\mathbf{C}}$ with BzCl + cold dil. aq. alk. (4). Note that in light of subsequent work (1) the identity of this prod. has been questioned.]
- Ethyl-trimethyl-carbinyl p-nitrobenzoate: cryst. from pet. ether, m.p. 70-71.5° (1).
 [Note that this m.p. is identical with that of the p-nitrobenzoate of 2,2,2-trichloroethanol-1 (3:5775); although each appears to be authentic, whether their mixture shows depression of m.p. is not reported.]

Č when pure is colorless oil, volatile with steam.

[For f.p./compn. data and diagram of system $\bar{C}+o$ -dichlorobenzene (3:6055) (eutectic, m.p. -45.9°, contg. 51.3% \bar{C}) see (12); on system $\bar{C}+p$ -dichlorobenzene (3:0980) (eutectic, m.p. -29.9°, contg. 88.0% \bar{C}) see (12); for f.p./compn. data on ternary system of all three dichlorobenzenes see (7); for f.p./compn. data on systems: $\bar{C}+f$ fluorobenzene, $\bar{C}+c$ chlorobenzene (3:7903), $\bar{C}+c$ bromobenzene, and $\bar{C}+c$ -chlorotoluene (3:8245) see (9).]

[For data on densities of solns. of \bar{C} in C_6H_6 (1:7400) and in *n*-hevane (1:8530) see (13).] [\bar{C} is very spar. sol. aq. (for study of this over range 20-60° see (14)).]

[For prepn. of C from m-chloroaniline [Beil. XII-602, XII₁-(300)] via diazotization and use of Cu₂Cl₂ reactn. (yields: 80% (15), 70% (16)) (7) (17) or by pptn. of the diazonium chloroplatinate and htg. of latter with Na₂CO₃ (4) see indic. refs.; from 2,4-dichloroaniline [Beil. XII-621, XII₁-(309)] via diazotization in alc. (18) (17) (3) (4) or isoamyl alc. (19) followed by replacement of orig. amino group by H by actn. of the alc. (60% yield (15)) or with hypophosphorous acid (50% yield (19)) (use of alk. SnCl₂ or oxidn. of the corresp. 2,4-dichlorophenylhydrazine with CuSO₄ gave only very low yields (15)) see indic. refs.; from m-phenylenediamine [Beil. XIII-33, XIII₁-(10)] via tetrazotization in AcOH with

nitrosylsulfuric acid followed by use of Cu₂Cl₂ reactn. (70.4% yield (20)) (21) see indic. refs.]

[For prepn. of \tilde{C} from *m*-chloronitrobenzene [Beil. V-243, V₁-(129)] with SOCl₂ in s.t. at 190-200° for 12 hrs. (71% yield (22)), from *m*-nitrobenzenesulfonic acid [Beil. XI-68, XI₁-(21)] with SOCl₂ in s.t. at 180-200° (23), from *m*-bromonitrobenzene [Beil. V-248, V₁-(131)] with PCl₅ in s.t. at 180° (24), from 2,6-dichlorobenzoic acid (3:4200) by htg. in acetamide at 225-235° for 6 hrs. (93% yield (25)), or from 2,6-dichlorobenzaldehyde (3:1690) with 50% KOH under N₂ at 100° for 5 hrs. (84% yield (6)) see indic. refs.]

[For formn. of \bar{C} from 2,6-dichloroacetophenone (5), 2,4-dichlorobenzophenone (3:0825) (26), 2,6-dichlorobenzophenone (3:1285) (26), or 3,5-dichlorobenzophenone (3:1505) (26) by fusion with KOH/NaOH see indic. refs.; for formn. of \bar{C} from 1,3-dichlorocyclohexadiene-1,3 [Beil. V-114] with PCl₅ or with Br₂ in CHCl₃ see (27).]

[For formn. of \bar{C} from C_6H_6 (1:7400) or chlorobenzene (3:7903) with Cl_2 + cat. at 400-700° (50-60% yield (12)) (28) or with Cl_2 in pres. of AlCl₃ (29) cf. (30) see indic. refs.] [\bar{C} with Cl_2 + Al/Hg (31) or with Cl_2 + AlCl₃ (30) cf. (29) gives mainly 1,2,4-trichlorobenzene (3:6420). — \bar{C} suspended in 1% aq. NaOH adds 3 Cl_2 in sunlight giving (32) m-dichlorobenzene hexachloride, cryst. from alc., m.p. 81.8° (32). — For study of photochemical chlorination of \bar{C} see (33).]

[\bar{C} with Mg (1 mole) + I_2 (0.25 equiv.) gave (34) after 3 days 62.5% *m*-chlorophenyl MgCl.]

 $[\bar{C} \text{ with CHCl}_3 + \text{AlCl}_3 \text{ at } 65^\circ \text{ for } 14 \text{ hrs. as directed gives } (18\% \text{ yield } (35)) \text{ tris-}(2,4-\text{dichlorophenyl}) \text{methane, white cryst. from hot acetone, m.p. } 227-228.5^\circ (35). — <math>\bar{C}$ with CCl₄ + AlCl₃ as directed gives (60% yield (35)) 2,4,2',4'-tetrachlorobenzophenone dichloride, white pl. from hot acetone, m.p. $139.0-140.5^\circ$ (35), 140° (36); hydrolysis of this prod. with AcOH/H₂SO₄ yields (37) 2,4,2',4'-tetrachlorobenzophenone, m.p. 78° (37), accompanied by some 2,4-dichlorobenzoic acid (3:4560), m.p. 161° (37).]

[\bar{C} with acetyl chloride (3:7065) + AlCl₃ gives (15% yield (38)) 2,4-dichloroacetophenone, b.p. 140-150° at 15 mm. (38), m.p. 33-34° (38). — \bar{C} with chloroacetyl chloride (3:5235) + AlCl₃ in CS₂ yields (39) 2,4-dichlorophenacyl chloride (2,4, ω -trichloroacetophenone), pr. from lgr., m.p. 57° (39). — \bar{C} with β -chloro-n-butyric acid (3:0035) + AlCl₃ or conc. H₂SO₄ yields (40) by condens. and subsequent ring closure 4,6-dichloro-3-methylindanone-1, m.p. 67-70° (40). — \bar{C} with σ -bromobenzoyl chloride + AlCl₃ in CS₂ gives (43% yield (41)) 2-bromo-2',4'-dichlorobenzophenone, b.p. 227-228.5°, m.p. 33-34°.]

[C with phthalic anhydride + AlCl₃ at 100-110° for 7 hrs. gives (17% yield on the anhydride (42)) (43) o-(2,4-dichlorobenzoyl)benzoic acid, white cubes from C₆H₆ or CHCl₃, m.p. 106-107° (42), 100-101° (43), accompanied (44) (especially if acetylene tetrachloride is used as solvent) by 3,3-bis-(2',4'-dichlorophenyl)phthalide, m.p. 176° (44); the above o-(2,4-dichlorobenzoyl)benzoic acid with fumg. H₂SO₄ at 155-160° ring-closes (90% yield (42)) to 1,3-dichloroanthraquinone [Beil. VII-787, VII₁-(411)], yel. ndls. from AcOH, m.p. 209-210° (42).]

[C on hydrolysis with steam + cat. at 550-850° yields (45) m-chlorophenol (3:0255) and/or resorcinol (1:1530). — For studies of reactn. of C with NaOMe/MeOH see (46) (47) (48).]

[\bar{C} with conc. aq. NH₄OH in pres. of CuO under press. at 150-200° (49) cf. (50) (51) yields m-phenylenediamine. — \bar{C} with K diphenylamine gives on htg. (16) (52) N,N,N',N'-tetraphenyl-m-phenylenediamine [Beil. XIII-42], m.p. 137.5-138° (16) (52) (note that this same prod. is similarly obtd. from o-dichlorobenzene (3:6055) and in part also from p-dichlorobenzene (3:0980).]

[\bar{C} on mononitration, e.g., by soln. in 4.5 moles HNO₃ (D=1.5) in cold followed by 10 min. htg. at 70° (53) or with 5 pts. fumg. HNO₃ (D=1.52) at 0° (90% yield (54)) cf.

(3). (27) (17) gives 1,3-dichloro-4-nitrobenzene [Beil. V-245, V_{1} -(131)], cryst. from alc., m.p. 34° (55), 33–34° (27), 33° (53) (3), accompanied by a little (2.6% at -30° , 4% at 0° (17)) 1,3-dichloro-2-nitrobenzene [Beil. V-246, V_{1} -(131)], m.p. 70.5° (55), 70° (56) (reactn. prod. with piperidine is 3-chloro-2-nitro-1-piperidinobenzene, m.p. 63° (57)).]—[The only other possible mononitro-m-dichlorobenzene, viz., 1,3-dichloro-5-nitrobenzene [Beil. V-246, V_{1} -(131)], m.p. 65° (55), has been prepd. indirectly.]

C on dinitration, e.g., with 3.4 wt. pts. HNO₃ (D = 1.54) + 6.8 wt. pts. conc. H₂SO₄ at 99° for 1 hr. (56) (cf. (22) (58) (27) (59) (60) (61)) gives (85% yield (56)) 1,3-dichloro-4,6-dinitrobenzene [Beil. V-265, V₁-(138)], cryst. from alc., m.p. 103° (22) (60), 102-103° (58), 102° (27), 101° (56), accompanied by 15% yield (56) of 1,3-dichloro-2,4-dinitrobenzene [Beil. V-265], m.p. 68° (56). — For f.p./compn. data and diagram for these two cpds. (eutectic, m.p. 48.1°, contg. 38% of the former) see (56). — Note that 1,3-dichloro-4,6-dinitrobenzene with piperidine in alc. boiled for 10 min. replaces 1 chlorine yielding (62) 1-chloro-4,6-dinitro-3-piperidinobenzene, yel. cryst. from alc., m.p. 119° (62); with piperidine in pyridine (requires cooling) it replaces both chlorine atoms yielding (62) 4,6-dinitro-1,3-dipiperidinobenzene, yel. lfts. from AcOH, m.p. 130-131° (62). — [Both of the other two possible dinitro-m-dichlorobenzenes are known, viz., 1,3-dichloro-2,5-dinitrobenzene [Beil. V₁-(138)], m.p. 114°, and 1,3-dichloro-4,5-dinitrobenzene [Beil. V-264], m.p. 98°, but have been prepd. indirectly.]

[The direct trinitration of C has not been reported; of the four possible trinitro-m-dichlorobenzenes only one, viz., 1,3-dichloro-2,4,6-trinitrobenzene [Beil. V-275], m.p. 128°, is known.]

[\bar{C} on monosulfonation with fumg. H_2SO_4 at 230° (3) or with fumg. H_2SO_4 (7% SO_3) at 100° (7) or with fumg. H_2SO_4 (12% SO_3) (54) gives (82% yield (54)) 1,3-dichlorobenzene-sulfonic acid-4 [Beil. XI-55, XI₁-(15)], m.p. 86° (54) (corresp. sulfonyl chloride, m.p. 54.6° (7), corresp. sulfonamide, m.p. 182° (7) (see also below)), both \bar{C} and its *ortho* isomer (3:6055) sulfonate with about equal case, both much more readily than p-dichlorobenzene (3:0980) (use in sepns. from latter).]

[C on disulfonation with fumg. H₂SO₄ (45% SO₃) at 140-150° for 5 hrs. (63) gives 1,3-dichlorobenzenedisulfonic acid-4,6 (corresp. bis-(sulfonyl chloride), m.p. 122-123° (63) (64), corresp. bis-(sulfonamide), m.p. 276° (63); unlike the corresp. 1,3-dichloro-4,6-dinitrobenzene the halogen in this disulfonic acid is unreactive (63).]

[For study of kinetics of sulfonation of C see (66).]

① 1,3-Dichlorobenzenesulfonamide-4 (2,4-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 179-180° u.c. (65). [From C on treatment as directed (65) with Cl.SO₃H followed by conv. of the intermediate 1,3-dichlorobenzenesulfonyl chloride-4, m.p. 52-53° u.c. (65), to the sulfonamide by means of (NH₄)₂CO₃.] — [Note that although the m.p. of this sulfonamide is practically identical with that from p-dichlorobenzenesulfonyl chlorides, viz., 52-53° for C, 38° for the p-isomer, may also serve to distinguish them (65).]

$$C_4H_8OCl_2$$
 Beil. I-382 $(sym.\text{-Dichloro-}ter\text{-butyl alcohol})$ CH_3 I_1 — I_2 — CH_2 CH_2

[See also the isomeric 1,1-dichloro-2-methylpropanol-2 (3:5772).]

Č with aq. forms a const.-boilg. mixt., b.p. 98.3°, contg. 35.2% Č (8). — Soly. of Č in aq. at 20° is 9.4 g. Č in 100 g. aq., soly. of aq. in Č at 20° is 10.8 g. aq. in 100 g. Č (8).

PREPARATION OF C

[For prepn. of $\bar{\mathbb{C}}$ from 1-chloro-2-methylpropene-2 (methallyl chloride = isobutenyl chloride) (3:7145) by addn. of HOCl with HOCl (yields: 33% (4), 32% (3)) (7), with Cl₂/aq. (70% yield (8)), or with organic hypochlorites (7) see indic. refs.; note that if the initial methallyl chloride conts. β , β -dimethylvinyl chloride (isocrotyl chloride) (3:7120) the crude HOCl addn. prod. will contain 1,1-dichloro-2-methylpropanol-2 (3:5772), but this can be separated from $\bar{\mathbb{C}}$ by fractional distillation.]

[For prepn. of \bar{C} from α, α' -dichloroacetone (3:0563) with MeMgBr (yields: 80-85% (6), 40% (5)) (1) see indic. refs.; from chloroacetone (3:5425) with diazomethane via β -methyl epichlorohydrin (3-chloro-2-methyl-1,2-epoxypropane) (3:7657) and subsequent ring opening with conc. HCl see (2).

CHEMICAL BEHAVIOR OF C

WITH INORGANIC REACTANTS

Dehydration. [\bar{C} is difficult to dehydrate but on twice htg. with equal wt. P_2O_5 at 110-195° for 2 hrs. gives (46% yield (6)) 1,3-dichloro-2-methylpropene-1 (3:5590). — \bar{C} with strong H_2SO_4 loses H_2O giving (9) 80% 3-chloro-2-(chloromethyl)propene-1 (3:5633) + 20% 1,3-dichloro-2-methylpropene-1 (3:5590).]

Dehydrohalogenation. \tilde{C} with aq. $Ca(OH)_2$ loses 1 HCl giving (93% yield (10) (11)) 3-chloro-2-methyl-1,2-epoxypropane (β -methylepichlorohydrin) (3:7657) which distils as its azeotrope, b.p. 89.8°, contg. 25.6% aq. (10). — Note that, if alk. is added in excess, reactn. is complete in a few seconds at room temp. and the process can even be used as a method for detn. of \tilde{C} in aq. soln. [For use of \tilde{C} in comml. prepn. of β -methylepichlorohydrin (3:7657), β -methylglycerol monochlorohydrin, β -methylglycidol, and β -methylglycerol see (10).]

Behavior with sodium sulfite. [C (1 mole) with aq. Na₂SO₃ (2 moles) at 70-90° for 2 hrs. yields (3) the salt of 2-methylpropanol-2-disulfonic acid-1,3; this prod. with PCl₅ not only is converted to the bis (acid chloride) but simultaneously loses H₂O yielding (3) 2-methylpropen-1,3-bis-(sulfonyl chloride), long ndls. from CCl₄, C₅H₅, or pet. ether, m.p.

79.2-79.8° (3) (corresp. bis-(sulfonamide), m.p. 152.5-154° (3); corresp. bis-(anilide), m.p. 171.5-172.5° (3)).]

BEHAVIOR WITH ORGANIC REACTANTS

[Č with KCN (2 moles) yields (4) 1,3-dicyano-2-methylpropanol-2; note, however, that attempts to purify this prod. by vacuum distn. lead only to decomposition and polymerization (4).]

- **D 1,3-Di-**(β -naphthoxy)-2-methylpropanol-2 (2-methylglycerol α,α' -di(β -naphthyl ether): colorless cryst. from alc., m.p. 151–152° (5). [From \bar{C} with sodium β -naphtholate in boilg. alc. (5).]
- ---- sym.-Dichloro-ter-butyl acetate: unreported.

[See also p-chlorophenol (3:0475).]

Č has disagreeable and persistent odor (13) suggesting iodoform (14) (for study of strength of odor in aq. soln. see (14)). — Č is spar. sol. in aq. at ord. temp. (for details see (15)). Č is sol. alc. or ether. — Č is volatile with steam even from soln. in equiv. aq. NaOH (dif. and sepn. from 2.4-dichlorophenol (3:0560) (27)).

The cryoscopic const. of \bar{C} is 77.2 (16), but the m.p. of \bar{C} is not always a good criterion of its purity; e.g., the pres. of as much as 20% phenol (1:1420) lowers f.p. of \bar{C} only 1.7% (17) (see also below). — [For removal of phenol from \bar{C} by means of treatment of mixt. with 10% aq. K_2CO_3 , extraction of the phenol with ether, etc., see (18).]

Selected data on binary systems contg. \bar{C} : $\bar{C} + aq.$; for soly./temp. data see (15): $\bar{C} + C_6H_6$; for f.p./compn. data see (15); for n_D^{16} 5 compn. data see (12): $\bar{C} + acetone$; these two substances form a mol. epd., C.C₃H₆O, m.p. -39.8° (19), this mol. epd. forms with acetone a eutectic, m.p. -97.1°, contg. 7.2 mol. % \bar{C} , and with \bar{C} another eutectic, m.p. -47.6°, contg. 62.4 mol. % \bar{C} (19); for the D_4^t of mixts. of \bar{C} + acetone for t = 0-50° see (3): \bar{C} + phenol; for anal. of this mixt. by bromometric methods see (17).

- $\ddot{\mathbf{C}}$ + aniline; these two substances form a mol. cpd., $\ddot{\mathbf{C}}.\mathbf{C}_6\mathbf{H}_5\mathbf{NH}_2$, m.p. 29.4° (19); this mol. cpd. forms with aniline a eutectic, m.p. -12° , contg. 9.7 mol % $\ddot{\mathbf{C}}$, and with $\ddot{\mathbf{C}}$ another eutectic, m.p. -1.75° , contg. $\dot{\mathbf{S}}3.8$ mol % $\ddot{\mathbf{C}}$ (19); for D_4^t of mixts. of $\ddot{\mathbf{C}}$ + aniline for $t=10-150^\circ$ see (3) (21); $\ddot{\mathbf{C}}$ + p-toluidine: these two substances form a mol. cpd., $\ddot{\mathbf{C}}.\mathbf{C}_3\mathbf{H}_4$ -NH₂, m.p. 38.9° (20); this mol. cpd. forms with p-toluidine a eutectic, m.p. 25.2°, contg. 24 mol % $\ddot{\mathbf{C}}$, and with $\ddot{\mathbf{C}}$ another eutectic, m.p. 3.6°, contg. 83.6 mol % $\ddot{\mathbf{C}}$ (20); for $n_D^{\rm co}/\mathbf{C}$ compn. data and diagram of the system see (20): \ddot{C} + phenylhydrazine; for $D_2^{\rm co}/\mathbf{C}$ compn. data see (21).
- $\bar{\mathbb{C}}$ + dimethylaniline: these two substances form a mol. cpd., $\bar{\mathbb{C}}.\mathbb{C}_6H_5N$ (CH₃)₂, m.p. 16.7° (19); this mol. cpd. forms with dimethylaniline a eutectic, m.p. -4.0° , contg. 11 mol. % $\bar{\mathbb{C}}$, and with $\bar{\mathbb{C}}$ another eutectic, m.p. abt. -3° , contg. abt. 84 mol. % $\bar{\mathbb{C}}$ (19); for D_4^t of mixts. of $\bar{\mathbb{C}}$ + dimethylaniline for $t=0-80^\circ$ see (3): $\bar{\mathbb{C}}$ + pyridine; these two substances form a mol. cpd., $\bar{\mathbb{C}}.\mathbb{C}_5H_5N$, m.p. -21.6° (19); this mol. cpd. forms with pyridine a eutectic, m.p. -36.9° , contg. 23.1 mol. % $\bar{\mathbb{C}}$, and with $\bar{\mathbb{C}}$ another eutectic, m.p. -36.9° , contg. 66.1 mol. % $\bar{\mathbb{C}}$ (19); for D_4^t of mixts. of $\bar{\mathbb{C}}$ with pyridine for $t=0-110^\circ$ see (3); for data on n_D^{25} and n_D^{25} for this system see (11): $\bar{\mathbb{C}}$ + quinoline: these two subst. form a mol. cpd., $\bar{\mathbb{C}}.\mathbb{C}_5H_7N$, m.p. 47.4° (19); this mol. cpd. forms with quinoline a eutectic, m.p. -27.6° , contg. 9.6 mol. % $\bar{\mathbb{C}}$, and with $\bar{\mathbb{C}}$ another eutectic, m.p. -10.9° , contg. 79.1 mol. % $\bar{\mathbb{C}}$ (19); for D_4^t of mixts. of $\bar{\mathbb{C}}$ with quinoline for $t=0-110^\circ$ see (3): $\bar{\mathbb{C}}$ + N-methyldiphenylamine: this system does not form a mol. cpd. but shows a eutectic, m.p. -29.1° , contg. 43.6 mol. % $\bar{\mathbb{C}}$ (19); for D_4^t of mixts. of $\bar{\mathbb{C}}$ with N-methyldiphenylamine for $t=0-80^\circ$ see (3).
- $\ddot{\mathbf{C}}$ + p-chlorophenol (3:0475): this system has eutectic, m.p. about -20.5° , contg. abt. 61.5 mol. % $\ddot{\mathbf{C}}$ (9), for sepn. or detn. of $\ddot{\mathbf{C}}$ see (27): $\ddot{\mathbf{C}}$ + p-dichlorobenzene (3:0980); this system has eutectic, m.p. -0.4° , contg. 80 wt. % $\ddot{\mathbf{C}}$ (10).

[For prepn. of C from o-chloroaniline [Beil. XII-597, XII₁-(297)] via diazotization in dil. H₂SO₄ and subsequent warming of soln. (22) or adding dropwise to strong H₂SO₄ at 140° (65% yield (9)) see indic. refs.: from o-aminophenol [Beil. XIII-354, XIII₁-(108)] via diazotization, conv. to corresp. PtCl₄ double salt, and subsequent dry distn. (23), or from o-aminophenol hydrochloride via diazotization and distn. with Cu₂Cl₂ soln. (32% yield (24)) see indic. refs.]

[For prepn. of \bar{C} from phenol (1:1420) with Cl_2 without solvent at 40-155° (9) (13) (25) (26) (note that an approximately equal amt. of p-chlorophenol is also formed and that the proportion is not much affected by temp. (9) (27)) see indic. refs; from phenol with Cl_2 in pres. of aq. NaOH (28), aq. Na₂CO₃ (29), or in CCl₄ soln. (30) (31) see indic. refs.; from phenol with N,N'-dichlorourea (32), with ethyl hypochlorite (3:7022) (33), or with SO₂Cl₂ (34) see indic. refs.]

[For prepn. from 2-chlorophenolsulfonic acid-4 [Beil. XI-244] by htg. with aq. at 180-200° under press. (35) or from 2-chlorophenoldisulfonic acid-4,6 [Beil. XI₁-(58)] by distn. with steam at 120° (81% yield (36)), from phenol-p-sulfonic acid [Beil. XI-241, XI₁-(55)] in nitrobenzene at 55° with Cl₂ (72% yield (37)) see indic. refs.]

[For prepn. of Č from o-dichlorobenzene (3:6055) by partial hydrol. with aq. MeOH or EtOH alk., alk. earths, or alk. carbonates in pres. of Cu or Cu salts at elevated temps. under press. see (38)-(46) incl.]

[\bar{C} in excess dil. aq. KOH with H₂ in pres. of Ni absorbs 1 mole H₂ (47) but more slowly than m-chlorophenol (3:0255) or p-chlorophenol (3:0475). — \bar{C} is not reduced with HI in AcOH at 25° (48).]

[Č on oxidn. with 35% peracetic acid at 25° gives slowly (17 days) in small yield (49) a-chloromuconic acid (2-chlorobutadiene-1,3-dicarboxylic acid-1,4), m.p. 190° (49), + 5-chlorohexadiene-2,4-al-6-oic acid-1, m.p. 145° (49).]

[$\tilde{\mathbf{C}}$ with $\mathbf{Cl_2}$ (2 moles) in AcOH gives (80% yield (50)) 2,4-dichlorophenol (3:0560); $\tilde{\mathbf{C}}$ with $\mathbf{Cl_2}$ (3 moles) undoubtedly gives 2,4,6-trichlorophenol (3:1673). — For study of chlorination of $\tilde{\mathbf{C}}$ with HOCl see (51).]

Č with Br₂ (1 mole) in CCl₄ gives (87% yield (52)) 4-bromo-2-chlorophenol, ndls. from lgr., m.p. 48-49° (52), 49-50° (53), 50-51° (54). — Č with Br₂ (2 moles) in aq. KBr soln. gives (55) 2-chloro-4,6-dibromophenol [Beil. VI-203], ndls. from alc., m.p. 76° cor. (55), 75-76° (56). — Č with large excess Br₂ in pres. of Fe powder gives (57) 2-chloro-3,4,5,6-tetrabromophenol, ndls. from alc. or AcOH, m.p. 224° (57).

[\bar{C} in aq. alk. with I_2/KI soln. as directed (55) gives 2-chloro-4,6-di-iodophenol, ndls. from alc., m.p. 96° (55). — For study of iodination of \bar{C} see (58).]

[C on nitrosation as directed (59) (60) gives (96% yield (60)) 2-chloro-4-nitrosophenol (2-chlorobenzoquinone-1,4-oxime-4) [Beil. VII-631, VII₁-(346)], pale yel. ndls. from C_6H_6 , m.p. 145° (60), 142° (59); for discussion of tautomerism of this cpd. see also (61) (62) (63).]

[$\bar{\mathbf{C}}$ on mononitration, e.g., with cold mixt. of equal pts. HNO₃ (D=1.36) + aq. (13), with HNO₃ in MeOH (64), or with HNO₃ (D=1.5) in AcOH (65), gives a mixt. of 2-chloro-4-nitrophenol [Beil. VI-240], ndls. from aq., m.p. 110-111°, and (32% (65)) 2-chloro-6-nitrophenol [Beil. VI-239], ndls. from aq., m.p. 70-71°; of these only the latter is volatile with steam (use in detn. of $\bar{\mathbf{C}}$ in mixts. with 4-chlorophenol (3:0475) (27)). — Both of the other mononitro-o-chlorophenols are known but have been obtd. only by indirect means; e.g., 2-chloro-3-nitrophenol, m.p. 120.5° (66), 120° (67), and 2-chloro-5-nitrophenol, m.p. 119.5° (66).]

 $\tilde{\mathbf{C}}$ on dinitration, e.g., by soln. in HNO₃ (D=1.36) and subsequent warming yields (68) 2-chloro-4,6-dinitrophenol [Beil. VI-259, VI₁-(128)], cryst. from alc., m.p. 113° (68); this prod. (unlike picric acid) is volatile with steam from H₂SO₄ soln. (use in anal. of mixts. of $\tilde{\mathbf{C}}$ with phenol (17)).

[Č in alk. soln. couples with diazotized aniline giving (70% yield (69) (70) (71)) 3-chloro-4-hydroxyazobenzene (2-chlorobenzoquinone phenylhydrazone-4) [Beil. XVI-120], yel. pr. from aq. alc., m.p. 88.5° (69), 88° (70), 86° (71). — For study of corresp. coupling of C with diazotized p-nitroaniline see (72).]

[For mercuration of \bar{C} and use of products as seed disinfectants, etc., see (73); for condens. prods. of \bar{C} with C_6H_5 .Hg.OH see (74).]

[\bar{C} over pumice in a silica tube at dull red heat (75) or K salt of \bar{C} + K phenolate at 250° for 8 hrs. (81) yields diphenylene dioxide [Beil. XIX-44, XIX₁-(618)], ndls. from MeOH, m.p. 119°, readily identified by dinitration with fumg. HNO₃ in AcOH (75) to dinitrodiphenylene dioxide, ndls. from pyridine, m.p. 257° (75).]

Condensation reactions involving nuclear hydrogens. [\bar{C} with formalin (1:0145) in pres. of conc. HCl treated with HCl gas as directed (76) gives 3-chloro-4-hydroxybenzyl chloride, m.p. 92-93° (76). — \bar{C} with formalin + H₂SO₄ (60%) at 60-65° for 16 hrs. gives (76) 3,3'-dichloro-4,4'-dihydroxydiphenylmethane, m.p. 103-104° (76). — \bar{C} with formalin (1:0145) + aq. 10% NaOH as directed (77) yieds acc. to conditions 3-chloro-4-hydroxybenzyl alc., pl. from C_6H_6 , m.p. 123.5-124°, and/or 3-chloro-4-hydroxy-5-(hydroxymethyl)-

benzyl alc., ndls. from CHCl₃, m.p. 117.5-119°. — For condens. of Č with formalin in prepn. of synthetic tanning agents see (78).]

[$\bar{\mathbb{C}}$ with CHCl₃ or CHBr₃ (79) in pres. of aq. NaOH undergoes Reimer-Tiemann reaction yielding both 3-chloro-2-hydroxybenzaldehyde (3:1010) and 3-chloro-4-hydroxybenzaldehyde (3:4065). — $\bar{\mathbb{C}}$ with CCl₄ in alc. alk. in s.t. at 125–136° yields (80) 3-chloro-4-hydroxybenzoic acid (3:4675). — $\bar{\mathbb{C}}$ with α,α -dichlorodiphenylmethane (3:6960) + AlCl₃ in cold CS₂ gives (31) 3-chloro-4-hydroxyphenyl-diphenyl-carbinol, from 60% AcOH as deep orange pl. of quinonoid desmotrope, m.p. 118°, but from alc. colorless crysts. of benzenoid desmotrope (contg. ½ mole solvent), m.p. 70–72° (31); note that in hot C₆H₆, however, this reaction takes a different course yielding (31) α,α -bis-(o-chlorophenoxy)diphenylmethane, cryst. from hot alc., m.p. 191–192° (31). — $\bar{\mathbb{C}}$ with chloral hydrate (3:1270) in pres. of alk. salts condenses (82) to 3-chloro-4-hydroxyphenyl-trichloromethyl-carbinol which on hydrolysis with NaOH yields 3-chloro-4-hydroxybenzaldehyde (3:4065).]

[\bar{C} with SOCl₂ + AlCl₃ in CS₂ gives (85% yield (83)) bis-(3-chloro-4-hydroxyphenyl) sulfoxide [Beil. VI₁-(422)], ndls. from dll. alc. contg. HCl, m.p. 195°. — \bar{C} with mixt. of conc. H₂SO₄ + fumg. H₂SO₄ (25% SO₃) at 100° for 6 hrs. disulfonates to 2-chloro-4,6-disulfophenol which undergoes bimolecular condensation to the corresp. internal ester (for details see (84)).]

[\bar{C} with phthalic anhydride (1:0725) with AlCl₃ in acetylene tetrachloride (3:5750) (85) (86) (87), or with AlCl₃ + NaCl at 150° (88), gives (yields: 96% (85) (86), 87% (88)) 2-(3'-chloro-4'-hydroxybenzoyl)benzoic acid, cryst. from MeOH, m.p. 224-225° (85), cryst. from AcOH, m.p. 219.5-220° (86), 219° (88); this prod. on ring closure with 15 pts. conc. H₂SO₄ at 150° for 1 hr. (88), or with 10 pts. conc. H₂SO₄ + 1 pt. ZnCl₂ at 130° for 5½ hrs. (85), or with 16 pts. 100% H₂SO₄ + 1 pt. H₃BO₃ at 195° for 1½ hrs. (86), gives (yields: 80% (85), 76% (88), 53.5% (86)) 3-chloro-2-hydroxyanthraquinone, yel. ndls. from AcOH, nitrobenzene + AcOH, or xylene, m.p. 267-268° (85), 266.5-267° (86), 266° (88). —Note that by slight variations other products are also formed; e.g., \bar{C} + phthalic anhydride + fumg. H₂SO₄ + H₃BO₃ at 170-200° for 10 hrs. gives (89) both chloro-hydroxy-anthraquinone and dhydroxyanthraquinone (. (90) and at 255° gives (91) 1,2,4-trihydroxyanthraquinone (purpurin). — Note that \bar{C} (2 moles) with phthalic anhydride (1 mole) at 125° for 6 hrs. gives (75% yield (92)) dichlorophenolphthalein, m.p. 98°.]

Reactions of nuclear halogen of \tilde{C} . [\tilde{C} on hydrolysis with aq. alk., alk. carbonates, or alkaline earths in pres. of cat. such as Cu or Cu salts at elevated temps. and under press. yields (93) (94) (95) (96) (97) (98) pyrocatechol (1:1520) cf. (43). — \tilde{C} on fusion with KOH yields (13) pyrocatechol but some resorcinol (1:1530) is also formed (98) (99). — \tilde{C} with aq. Na₂S + NaOH at 210–215° for 24 hrs. yields (100) 2-mercaptophenol [Beil. VI-793], b.p. 216–217° cor., m.p. +5°.]

Reactions of the phenolic group of \bar{C} (see also under \oplus , below). \bar{C} behaves as a weak acid; e.g., \bar{C} dis. in conc. aq. Na₂CO₃ soln. on shaking at room temp. (dif. and sepn. from phenol (18)) and is repptd. by treatment with CO₂ (18). — Dissoc. const. of \bar{C} in aq. = 32×10^{-10} (101); for studies of dissoc. const. in 50% MeOH at 20° (7) (101) (102), in 25% EtOH at 25° (103), in 30% EtOH at 25° (4) (102) see indic. refs.

 \overline{C} has bactericidal (104) (105) (106) (107) (108) (109) and fungicidal (110) properties.

[C with alkali metals gives corresp. alk. o-chlorophenolates; for use of these as antioxidants in motor fuels see {111}. — Dry Na o-chlorophenolate with CO₂ at 140-150° under press. yields (25) 3-chloro-2-hydroxybenzoic acid (3-chlorosalicylic acid) (3:4745).]

[C in MeOH/KOH with MeI in s.t. at 130° (112), or C with aq. KOH + Me2SO₄ at ord. temp. (113), yields o-chlorophenyl methyl ether (o-chloroanisole) (3:6255). — C in abs. alc. + NaOEt with EtI yields (115) o-chlorophenyl ethyl ether (o-chlorophenetole) (3:8735). — C with allyl bromide in acetone + aq. + NaOH gives (90% yield (146))

allyl o-chlorophenyl ether; b.p. $108-110^{\circ}$ at 15 mm., $D_{25}^{25}=1.132$, $n_{25}^{25}=1.5388$; this prod. on reflux. 10 min. gives by Claisen rearr. (89% yield (146)) 2-chloro-6-allylphenol, b.p. $61-63^{\circ}$ at 1 mm., $n_{25}^{25}=1.5447$.]

[$\bar{\mathbf{C}}$ with POCl₃ refluxed for 8-11 hrs., POCl₃ distd. off, and crude product saponified yields (117) bis-(o-chlorophenyl)phosphoric acid, m.p. 105-106° cor. — For condens. of $\bar{\mathbf{C}}$ with triphenylphosphine oxide and use of prod. as seed disinfectant see (118); for use of $\bar{\mathbf{C}}$ in prepn. of triaryl phosphates (119) or of mixed triaryl thiophosphates (120) and use as plasticizers see indic. refs. — $\bar{\mathbf{C}}$ with PCl₅ gives on htg. (22) o-dichlorobenzene (3:6055).]

 $[\bar{C}]$ with malic acid (1:0450) + conc. H_2SO_4 fails (121) to give the expected von Pechmann synthesis of 8-chlorocoumarin; however, \bar{C} with α -substituted acetoacetic esters + P_2O_5 condenses to corresp. chromones; e.g., \bar{C} with ethyl α -methylacetoacetate (1:1712) + P_2O_5 gives (27% yield (122)) 8-chloro-2,3-dimethylchromone [Beil. XVII₁-(177)], pale yel. ndls. from dil. alc., m.p. 108°; for further examples see (123). — \bar{C} (as sodium salt) + diethyl fumarate (1:3761) refluxed in xylene yields (124) diethyl α -(α -chlorophenoxy)-fumarate which on subsequent hydrolysis to the acid, ring closure with conc. H_2SO_4 , and decarboxylation gives 8-chlorochromone, colorless ndls., m.p. 114-115° (124).]

Č with AlCl₃ evolves HCl and yields (125) Cl.C₆H₄.O.AlCl₂, insol. CS₂, but sol. in alc. and hydrolyzed by aq., m.p. 207-210° (125). — Č in 50% alc. with satd. soln. of PkOH in 50% alc. yields (126) a mol. cpd., Č.PkOH, pale yel. ndls., m.p. 81-82° (126).

- P FeCl₃ color reaction: C in aq. soln. with very dil. FeCl₃ gives violet coloration; C in alc. with very dilute aq. FeCl₃ gives greenish-blue.
- ---- o-Chlorophenyl benzoate [Beil. IX-117]: oil, b.p. 314-316° (?) (127), 212-213° at 745 mm. (127), 155-157° at 3 mm. (127). [From C + benzoyl chloride + aq. NaOH (127) (for study of rate see (129)).] [Note also that C + BzCl + AlCl₃ in acetylene tetrachloride yields (128) the Fries rearr. prods. to be expected from o-chlorophenyl benzoate, viz., 3-chloro-4-hydroxybenzophenone, cryst. from alc. or C₀H₀, m.p. 180-181° (128), and 3-chloro-2-hydroxybenzophenone, pale yel. cryst. from alc., m.p. 92.5-93° (128).]
- O o-Chlorophenyl m-nitrobenzoate: pr. from lgr., m.p. 98° (18). [From C with m-nitrobenzoyl chloride on shaking with 10% aq. NaOH at 35-50° (18).]
- **o-Chlorophenyl** p-nitrobenzoate: ndls. from 85% alc., m.p. 114.5-114.8°. [From $\ddot{\mathbf{C}} + p$ -nitrobenzoyl chloride in pyridine (unpublished work).]
- ---- o-Chlorophenyl 3,5-dinitrobenzoate: ndls. from 85% alc., m.p. 143.1-143.4°. [From C + 3,5-dinitrobenzoyl chloride in pyridine (unpublished work).]
- --- o-Chlorophenyl benzenesulfonate: unrecorded.
- --- o-Chlorophenyl p-toluenesulfonate: m.p. 74° (4).
- —— o-Chlorophenyl benzyl ether: oil, b.p. 138-140° at 3 mm. (130). [From C (as Na salt) + benzyl chloride but in very poor yield (7.5% (130)); note that the products elsewhere (131) (132) seem to be questionable.]
- —— o-Chlorophenyl p-nitrobenzyl ether: m.p. 100° (133). [From Č (as Na salt) with p-nitrobenzyl bromide refluxed in aq. alc. (133).]
- **O** o-Chlorophenyl 2,4-dinitrophenyl ether: greenish-yel. ndls. from alc., m.p. 99° (134). [From \bar{C} in equiv. amt. aq. NaOH refluxed with alc. 2,4-dinitrochlorobenzene (134). Note that the m.p. of 75-76° reported earlier (135) for this compd. is identical with that given later (134) for the corresp. deriv. of m-chlorophenol (3:0255).]
- © o-Chlorophenoxyacetic acid (3:4375): m.p. 145-146° (136) (137), 143-145° (138); Neut. Eq. 186.5. [From Č in aq. NaOH (2 equivs.) with chloroacetic acid (1 equiv.) refluxed for 1 hr., then acidified (138) cf. (136) (137).]

- \odot o-Chlorophenyl N-(phenyl)carbamate: cryst. from C₆H₆, m.p. 120-121° (139). [From \ddot{C} + phenyl isocyanate in dry ether (139).]
- ⊕ o-Chlorophenyl N-(p-iodophenyl)carbamate: m.p. 156-157° (147). [From C̄ + p-iodobenzazide in hot lgr. (147).]
- \odot o-Chlorophenyl N-(p-bromophenyl)carbamate: pr. from EtOAc, m.p. 141-143° cor. (140). [From \ddot{C} + p-bromobenzazide in lgr. (140).]
- © o-Chlorophenyl N-(m-nitrophenyl)carbamate: m.p. 114° u.c., 116° cor. (148). [From C + m-nitrophenyl isocyanate (148) in lgr. (148).]
- © o-Chlorophenyl N-(p-nitrophenyl)carbamate: ndls. from lgr., m.p. 143° cor. {141}. [From C + p-nitrobenzazide in lgr. {141}.] [Note that corresp. deriv. of m-chlorophenol (3:0255) has m.p. 144° cor. (141).]
- \bigcirc o-Chlorophenyl N-(3,5-dinitrophenyl)carbamate: pl. from C₆H₆, m.p. 182-183° (142). [From $\ddot{\rm C}$ + 3,5-dinitrophenylazide htd. in dry toluene (142).]
- © o-Chlorophenyl N-(3,5-dinitro-4-methylphenyl)carbamate: yel. pl. from lgr. or EtOAc, m.p. 175-176°, u.c., 180-181° cor. (143). [From C + 3,5-dinitro-4-methylbenzazide in lgr. (143).]
- \odot o-Chlorophenyl N-(α -naphthyl)carbamate: cryst. from lgr., m.p. 120° (144). [From $\ddot{C} + \alpha$ -naphthyl isocyanate in lgr. (144).]
- **D** o-Chlorophenyl N-(β -naphthyl)carbamate: pl. from lgr., m.p. 133-134° u.c., 136-137° cor. (145). [From $C + \beta$ -naphthyl isocyanate (or azide) in lgr. (145).]
- --- o-Chlorophenyl N,N-diphenylcarbamate: unreported.
- 3:5980 (1) Kramers, Ann. 173, 331 (1874). (2) Kohlrausch, Pongratz, Monatsh. 65, 201 (1935). (3) Bramley, J. Chem. Soc. 109, 436, 445-457 (1916). (4) Bennett, Brooks, Glasstone, J. Chem. CH₂Cl

C₃H₆OCl₂

(
$$\beta$$
, β' -Dichloroisopropyl alcohol; glycerol α , α' -dichlorohydrin; '' α -dichlorohydrin'') CH_2Cl $I_{1-}(185)$ $I_{2-}(383)$ I_{2-}

Note: Because of the great magnitude of the literature of C only the most important citations can be included here; for much additional data prior to 1930, the appropriate volume of Beilstein should also be consulted.

 \bar{C} dis. at 19° in 9 pts. aq.; at 72° in 6 pts. aq.; misc. with ether. [For recovery of \bar{C} from aq. solns. by extraction with immiscible solvents (12) (13) (14) or by steam distillation (12) (15) see indic_refs.]

[For prepn. of \bar{C} from glycerol (1:6540) by actn. of HCl gas at 100-110° (yield: 87% (11), 82% (6), 55-57% (10)) (12) see indic. refs.; for prepn. of \bar{C} from 3-chloro-1,2-epoxy-propane (epichlorohydrin) (3:5358) with fumg. HCl (yield 80% (11)) (16) (17) (1) (18), with MgCl₂ in dil. alc. at 125° (19), or with S₂Cl₂ (67% yield (40)) see indic. refs.; for formn. of \bar{C} (together with other prods.) from glycerol (1:6540) with SOCl₂ + pyridine see (20); from corresp. acetate (3:6318) by alcoholysis with MeOH + HCl see (21) (45); from α,α' -dichloroacetone (3:0563) reductn. with yeast see (22).]

Č with aq. alk. rapidly loses HCl giving 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358) (yield: 90% (6), 80-90% (23), 76-81% (24-B), 67-72% (24-A), 85% (25), 79% (26)).

 \ddot{C} on oxidn. with Na₂Cr₂O₇ + H₂SO₄ gives (68–75% yield (27)) α,α' -dichloroacetone (3:0563). [Overoxidn. of this prod. or \ddot{C} on oxidn. with conc. HNO₃ (28) gives chloroacetic acid (3:1370).]

[\tilde{C} on reductn. with Na/Hg in moist ether gives various products including allyl alc. (1:6145), isopropyl alc. (1:6135), propylene together with epichlorohydrin (for refs. see Beil. I-364); \tilde{C} htd. with HI + P in s.t. at 180° gives (29) isopropyl iodide.]

[For behavior of Č with NaSH yielding 1,3-dithioglycerol (Hg deriv. m.p. 185°, Pb deriv. m.p. 175-180° dec.) see (41).]

 \overline{C} on htg. with P_2O_5 (31) or $POCl_3$ (11) (30) yields 1,3-dichloropropene-1 (3:5280).

 \tilde{C} on htg. with excess EtOH + NaOH yields (by a series of definite intermediate stages (25)) (6) 1,3-diethoxypropanol-2 (glycerol α,γ -diethyl ether) b.p. 108-111° at 60 mm., $D_4^{25} = 0.953$, $n_D^{25} = 1.420$ (19) (6); similarly \tilde{C} on htg. with excess phenol + aq. NaOH as specified (19) gives 80% yield 1,3-diphenoxypropanol-2 (glycerol α,γ -diphenyl ether), cryst. from alc., m.p. 80-81° (19).

- $----\beta, \beta'$ -Dichloroisopropyl acetate: b.p. 205° (see 3:6318).
- ---- β_{β} '-Dichloroisopropyl benzoate: b.p. 296° sl. dec. (42); 171-173° at 19 mm. (43), 157-160° at 12 mm. (44). [From \bar{C} + benzoyl chloride on htg. (42) or with pyridine (44).]
- Φ β,β'-Dichloroisopropyl p-nitrobenzoate: m.p. 59-60° (32), 58-59° (33). [From C + p-nitrobenzoyl chloride with pyridine (94% yield) (33) or with quinoline in CHCl₃ (100% yield) (32).]
- Φ β,β' -Dichloroisopropyl 3,5-dinitrobenzoate: m.p. 129° (32). [From $\tilde{C}+3,5$ -dinitrobenzoyl chloride + quinoline in CHCl₃ in 100% yield (32).]
- Φ β,β'-Dichloroisopropyl benzenesulfonate: long colorless ndls. from C₆H₆, m.p. 50°
 (34). [From C̄ + benzenesulfonyl chloride + conc. aq. NaOH (34); for study of pyrolysis see (35).]
- Φ β,β'-Dichloroisopropyl N-(phenyl)carbamate: m.p. 73-74° (20) (38), 73° (39). [From C with phenyl isocyanate (20) (39); also indirectly from C by conv. to corresp. chloroformate and reacting with aq. aniline (38).] [This prod. htd. a few min. with conc. aq. KOH loses HCl and ring-closes alm. quant. to 5-chloromethyl-3-phenyloxazolidone-2, pr. from hot alc., m.p. 104-105° (39).]
- β,β'-Dichloroisopropyl N-(α-naphthyl)carbamate: m.p. 115° (38). [Prepd. indirectly from C by conv. to corresp. chloroformate and reacting with aq. annline (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-(α-naphthyl)-oxazolidone-2, m.p. 118° (38).]
- Φ β,β'-Dichloroisopropyl N-(β-naphthyl)carbamate: m.p. 101° (38). [Prepd. indirectly from Č by conv. to corresp. chloroformate and reacting with aq. aniline (38).] [This prod. with conc. aq. alk. loses HCl and ring-closes to 5-chloromethyl-3-(β-naphthyl)-oxazolidone-2, m.p. 107° (38).]

CHAPTER XIV

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 1. D_4^{20} greater than 1.1500

(3:6000-3:6499)

3:6000 n-PROPYL DICHLOROACETATE
$$C_5H_8O_2Cl_2$$
 Beil. II - 204 $n_-C_3H_7.O.CO.CHCl_2$ II $_1$ — II $_2$ -(196)

B.P. 176.7-177° at 771 mm. (1)
$$D_4^{25} = 1.2006$$
 (4) $n_D^{25} = 1.4360$ (4) 176.0 -176.6° (2) $D_4^{20} = 1.2240$ (5) $n_D^{20} = 1.4398$ (5) 176°

[For prepn. (70% yield (3)) from anhydrous chloral (3:5210) in n-propyl alc. by treatment with 1.2 moles powdered KCN see (3); for prepn. (59% yield (4)) from cyclopropane + dichloroacetic ac. (3:6208) + BF₃ see (4).]

3:6600 (1) Schiff, Z. physik Chem. 1, 379 (1887)
(2) Cheng, Z. physik. Chem. B-24, 307 (1934).
(3) Chattaway, Irving, J. Chem. Soc. 1929, 1042.
(4) Dorris, Sowa, J. Am. Chem. Soc. 60, 358 (1938).
(5) Schjanberg, Z. physik. Chem. A-172, 229 (1935).

3:6010
$$\gamma$$
-CHLORO- n -PROPYL CHLOROFORMATE $C_4H_6O_2Cl_2$ Beil. S.N. 199 $(\gamma$ -Chloro- n -propyl chlorocarbonate) CH_2 CH_2 CH_2 CH_2 O -CO Cl

B.P. 177° (1)
$$D_{20}^{25} = 1.2946$$
 (1) $n_{\rm D}^{20} = 1.4456$ (1) 175–176° at 736 mm. (2)

Colorless liq.; insol. in aq. toward which it is relatively stable.

[For prepn. of Č from 3-chloropropanol-1 (trimethylene chlorohydrin) (3:8285) with phosgene (3:5000) in 80% yield see (1) (2).]

 \ddot{C} in quinoline begins to decompose into 1,3-dichloropropane (trimethylene (di)chloride) (3:5450) + CO_2 even at 35° (3) (for discussion see (4)).

 \bar{C} with primary arom. amines reacts as an acyl chloride yielding the corresp. γ -chloro-n-propyl N-arylcarbamates [e.g., \bar{C} with p-aminobenzenearsonic acid (arsanilic acid) gi res (92% yield (5)) γ -chloro-n-propyl N-(p-arsonophenyl)carbamate, m.p. 245-246° (5) cf. (6); for analogous reactions of \bar{C} with o-aminobenzenearsonic acid (5) (6), o-toluidine-5-arsonic acid (5), p-phenetidine (1), p-aminobenzoic acid (1), o-chloroaniline (1), or p-chloroaniline (1) see indic. refs.]; for simpler cases see below.

- —— γ-Chloro-n-propyl N-phenylcarbamate: pr. from alc., m.p. 38° (2), 35–36° (1). [From Č with aniline (2 moles) both diluted with dry ether (3 vols.) slowly mixed in flask surrounded by ice water, ether evaporated and prod. distilled, b.p. 160–170° at 5 mm. (2); this prod. in alc. on addn. of 1 N aq. NaOH ring-closes with loss of HCl giving (84% yield (2)) (1) 3-phenyl-tetrahydro-2-keto-1,3-oxazine, m.p. 96° (2), 94.0–94.5° (1).]
- \bigcirc γ -Chloro-n-propyl N-(o-tolyl)carbamate: ndls. from alc., m.p. 49° (2), 46.0–46.5° (1). [From $\bar{\mathrm{C}}$ with o-toluidine in dry ether as for preceding case (69% yield (2)); this prod. in alc. on addn. of 1 N aq. NaOH ring-closes with loss of HCl giving (60% yield (2)) (1) 3-(o-tolyl)-tetrahydro-2-keto-1,3-oxazine, m.p. 89° (1), 87.0–87.5° (2).]
 - γ -Chloro-n-propyl N-(p-tolyl)carbamate: oil, b.p. 188° at 4.5 mm., $D_{20}^{20} = 1.186$, $n_{D}^{18} = 1.494$ (1). [This prod. with alc. KOH (1 mole) refluxed 2 hrs. ring-closes with loss of HCl giving (1) 3-(p-tolyl)-tetrahydro-2-keto-1,3-dioxazine, m.p. 127.5-128° (1).]
- ① γ -Chloro-n-propyl N'-anilinocarbamate (γ -chloro-n-propyl N-phenylcarbazate): cryst. from C_6H_6 , m.p. 72° (7). [From \tilde{C} with phenylhydrazine (1 mole) in aqueous pyridine (62% yield (7)).]
- 3:8010 (1) Pierce, Adams, J. Am. Chem. Soc. 45, 791-794 (1923). (2) Dox, Yoder, J. Am. Chem. Soc. 45, 725-726 (1923). (3) Carré, Passedouet, Compt. rend. 201, 899 (1935). (4) Carré, Passedouet, Bull. soc. chm. (5) 3, 1073-1082 (1936). (5) Rodewald, Adams, J. Am. Chem. Soc. 45, 3102-3105 (1923). (6) Adams, Rodewald (to Abbott Laboratories), Brit. 255,971, Aug. 26. 1926, Cent. 1927, I 1744; C.A. 21, 2908 (1927) Cam. 254,983, Oct. 27, 1925; Cent. 1927, I 1744; C.A. 20, 424 (1926). (7) Dox, J. Am. Chem. Soc. 48, 1952 (1926).

3:6025
$$\beta,\beta'$$
-DICHLORODIETHYL ETHER $C_4H_8OCl_2$ Beil. I — (bis-(β -Chloroethyl) ether; ClCH $_2$ CH $_2$ O I_1 — I_2 -(335)

B.P. 177-178° cor. (1) M.P.
$$-24.5^{\circ}$$
 (2) $D_4^{20} = 1.2095$ (3) $n_D^{20} = 1.457$ (1) $80-82^{\circ}$ at $20-22$ mm. (3) $D_{20}^{20} = 1.213$ (1) 70° at 15 mm. (2) 66° at 12 mm. (2)

Colorless oil with pleasant ethereal odor. — [For data on surface tension and parachor see (4); for vapor-press. data see (5).]

[For prepn. from ethylene chlorohydrin (3:5552) see (1); for use in prepn. of di-(θ -chloroethyl) sulfate see (12).] [Note that \bar{C} forms with ethylene chlorohydrin (3:5552) a constboilg. mixt., b.p. 128.2°, contg. 8.2 mole % \bar{C} (15).]

The halogen atoms of \tilde{C} are very unreactive to most reagents; \tilde{C} is extremely resistant to hydrolysis, gives no Friedel-Crafts reaction with $C_6H_6+AlCl_3$, no reaction with KCN, and is unaffected by NaOH + As₂O₃ (2).

 \tilde{C} on htg. with solid KOH yields (6) (7) (9) (3) divinyl ether (1:7800) (accompanied by some β -chloroethyl vinyl ether (3:7464) q.v.), but \tilde{C} on htg. with dimethylaniline or quinoline fails to react at all, even to form quaternary salts (6).

 \tilde{C} on htg. with excess sodium alcoholates for 3-15 hrs. gives 36-45% yields of the corresponding liquid bis ethers (8); \tilde{C} in alc. refluxed overnight with an excess of Na phenolates yields corresponding bis ethers (9); e.g., \tilde{C} with Na α -naphtholate gives 52% yield bis $[\beta(\alpha$ -naphthoxy)ethyl] ether, m.p. 87° (9); \tilde{C} with Na β -naphtholate gives 56% yield bis- $[\beta$ -(β -naphthoxy)ethyl] ether, m.p. 122° (9).

 \tilde{C} on htg. with aniline (3 moles) for 2 hrs. at 200° gives (65% yield (9)) 4-phenylmorpholine, white flakes from 50% alc., m.p. 57-58° (1). [The crude prod. may also cont. bis-(\$\beta\$-anilinoethyl) ether, pl. from alc., m.p. 115.5° (9).] [For similar prepn. (77% yield (9)) of N-(\$p\$-tolyl)morpholine, m.p. 51° (8); N-(\$\alpha\$-naphthyl)morpholine (68% yield (9)), m.p. 83° (8); N-(\$\beta\$-naphthyl)morpholine (72% yield (9)), m.p. 90° (8), see (8) (9).] [For corresp. reaction of \tilde{C} with phenylhydrazine, p-phenylenediamine, and benzidine see (10); with ethylenediamine see (11).]

- $\beta_i \beta'$ -bis-(α -Naphthoxy)diethyl ether: m.p. 87° (16). [From $\ddot{C} + \alpha$ -naphthol (1:1500) + aq. NaOH in s.t. at 120° for 8 hrs. (16).]
- β,β' -bis- $(\beta$ -Naphthoxy)diethyl ether: m.p. 122° (16). [From $\tilde{C} + \beta$ -naphthol (1:1540) + aq. NaOH in s.t. at 120° for 8 hrs. (16).]
- bis-(β-Phthalimidoethyl) ether [Beil. XXI-470]: from C̄ on refluxing 3 hrs. with phthalimide + K₂CO₃ (13) or from C̄ + K phthalimide (2 moles) + trace of diethylamine on htg. 4 hrs. at 135-140° (55% yield) (9), cryst. from alc. (14), ndls. from 50% AcOH (13), m.p. 159° (9), 157° (13), 156.5° (14). [The half reaction prod., β-chloro-β-phthalimidodiethyl ether, ndls. from lt. pet., m.p. 72° (13), 69° (9), may be sepd. from the above bis-ether by its much greater solubility in pet. eth. (13).]

3:6035 1,1,2,3-TETRACHLOROPROPANE H
$$C_3H_4Cl_4$$
 Beil. I - 107 $ClCH_2$ — C — $CHCl_2$ I_1 — I_2 — I_3 — I_4 — I_5 — I_5 —1.522 (1) 179° (3)

[For prepn. of \bar{C} from 1,2,3-trichloropropane (3:5840) + SbCl₅ at 150-190° see (2); from 1,1,2-trichloropropane (3:5630) + Cl₂ + AlCl₃ see (3); from 1,3-dichloropropene-1 (3:5280) + Cl₂ see (4); from 3,3-dichloropropene-1 (3:5140) + Cl₂ see (1); from ordinary 1,2-dichloroethylene (3:5030) with CH₂Cl₂ (3:5020) + AlCl₃ at 40° for 8 hrs. (24% yield) see (5).

3:6035 (1) Romburgh, Bull. soc. chim. (2) 36, 553-557 (1881). (2) Herzfelder, Ber. 26, 2435 (1893). (3) Mouneyrat, Bull. soc. chim. (3) 21, 621-623 (1899). (4) Hartenstein, J. prakt. Chem. (2) 7, 312-313 (1873). (5) Lehmann, Bayer (to I.G.), Ger. 715,069, Dec. 16, 1941; Cent. 1942, I 2584; C.A. 38, 2051 (1944).

B.P. 180-182° cor. at 718 mm. (1) 179-181° (3)

[See also 1,1,1,3-tetrachloropropanone-2 (unsym.-tetrachloroacetone) (3:6085).]

Colorless liq. with penetrating odor; produces blisters on skin. — Eas. sol. cold aq., alc., ether, C_6H_6 .

Č with aq. readily yields a crystn. tetrahydrate, m.p. $48-49^{\circ}$ (1) (6), 48° (2), $47-48^{\circ}$ (3) (4) (for crystallographic data see (2), for polymorphism see (5)); this tetrahydrate loses its aq. on distn., on stdg. over H_2SO_4 , or by actn. of dry HCl gas.

[For prepn. of C from phloroglucinol (1:1620) via conversion in AcOH with Cl₂ to 1,1,-3,3,6,6-hexachloro-2,4,6-triketocyclohexane ("hexachlorophloroglucinol") [Beil. VII-854, VII₁-(469)], and treatment of latter with water (yield is almost quant.) (dichloroacetic acid (3:6208) is also formed) see (6); from 2,4,6-triaminophenol [Beil. XIII-569, XIII₁-(211)] (2), from chloroanilic acid (3:4970) (1) (7), from 3,3,5-trichlorocyclopentanetrione-1,2,4 [Beil. VII-852] (4), or from 2,2,5-trichlorocyclopentanedione-3,4-ol-1-carboxylic acid-1 [Beil. X-985] (4) by oxidn. with KClO₃ + HCl (other by-products are also formed and yield is low, e.g., 7% (7)) see indic. refs.; for formn. of C from isopropyl alc. (1:6135) with Cl₂ (8), from chloroacetone (3:5425) with Cl₂ at 50-70° in light (9), or from 1,1-dibromo-3,3-dichloropropanone-2 [Beil. I-658] with alc. HgCl₂ in s.t. at 100° for several hours (3) see indic. refs.]

[\tilde{C} (as tetrahydrate) on reduction with Zn + H₂SO₄ yields (1) acetone (1:5400); \tilde{C} on reduction with Al(OEt)₃, Mg(OEt)₂, or EtOMgCl yields (10) 1,1,3,3-tetrachloropropanol-2 (3:9037).]

C with satd. aq. NaHSO3 readily yields a NaHSO3 cpd. (3).

Č with aq. alk. does not (3) yield chloroform; Č with alk. + aniline does not (3) give phenylisocyanide (carbylamine test). [Dif. from the isomeric unsym.-tetrachloroacetone (3:6085).]

 \bar{C} in abs. ether with dry NH₃ gas adds 1 NH₃ giving (92% yield (2)) 1,1,3,3-tetrachloro-2-aminopropanol-2 [Beil. I-656], ndls. from C₆H₆, m.p. 110-111° dec. with prev. sublimation; this prod. is eas. sol. in cold aq. but on warming the soln. dissociates into its components. — [The action of \bar{C} with aq. NH₄OH or with aniline has not been clarified cf. (3).]

[\bar{C} with excess conc. aq. HCN warmed at 50-60° soon dissolves and after 12 hrs. warming (2) ppts. $\beta,\beta,\beta',\beta'$ -tetrachloro- α -hydroxyisobutyronitrile [Beil. III-318], cryst. from C₆H₆, m.p. 112-114° (2); this prod. with AcOH/H₂SO₄ as directed (2) yields the corresp. $\beta,\beta,\beta',\beta'$ -tetrachloro- α -hydroxyisobutyramide, cryst. from C₆H₆, m.p. 156° (2).]

C with PCl₅ on htg. gives (2) mainly 1,1,2,2,3,3-hexachloropropane (3:6525) accompanied by some 1,1,2,3,3-pentachloropropene-1 (3:6075).

[\tilde{C} with diazotized aniline (4 moles) in pres. of NaOAc yields (11) dichloro-bis-(benzene-azo)methane, yel.-or. cryst. from hot alc., m.p. $81-82^{\circ}$ (11); \tilde{C} with diazotized p-toluidine (4 moles) in pres. of NaOAc yields (11) dichloro-bis-(p-tolueneazo)methane, orange cryst. from C_0H_6 , m.p. $159-160^{\circ}$ (11).] [These prods. are also similarly obtd. (11) from unsymdichloroacetone (3:6085).]

4-(Benzeneazo)-1-phenylpyrazole [Beil. XXV-535]: golden-yel. lfts. from dil. alc. or lgr., ndls. from AcOH, m.p. 126-127° cor. (2), 126° (6). [From Č in abs. alc. (2) or AcOH (6) with excess phenylhydrazine, refluxed for 5 min.]

 \bar{C} when pure is colorless oil, volatile with steam. — Ord. comml. \bar{C} conts. also the isomeric p-dichlorobenzene (3:0980), even as much as 25% (16); and a comml. prod. sold as insecticide conts. 40% \bar{C} + 30% p-dichlorobenzene (3:0980) + 30% trichlorobenzene (17).

[For f.p./compn. data and diagram of system $\bar{C}+p$ -dichlorobenzene (3:0980) (cutectic, m.p. -23.4° , contg. 86.7% \bar{C}) see (10) (11); for f.p./compn. data and diagram of system $\bar{C}+m$ -dichlorobenzene (3:5960) (cutectic, m.p. -45.9° , contg. 48.7% \bar{C}) see (11); for f.p./compn. data on ternary system of all three dichlorobenzenes see (10).]

[For data on densities of solns. of \bar{C} in C_6H_6 (1:6400) and in *n*-hexane (1:8530) see (18); for data on D_{20}^{20} and n_{20}^{20} on system \bar{C} + diethylbenzene (and use of the mixt. in testing fractionating columns) see (19).]

[Č is very spar. sol. aq. (for study of this soly. over range 20-60° see (20).]

[For study and use of \bar{C} as cleaner for metals see (21); for use as solvent for fats and oils (16) and for detn. of oils in seeds (by use of density of resultant extract (22) see indic. refs.; for use for removal of tar or pitch from surfaces coated with cellulose esters see (23); for use as solv. in purification of anthraquinone see (24); for study of toxicity of \bar{C} see (25).]

[For prepn. of Č from o-chloroaniline [Beil. XII-597, XII₁-(297)] via diazotization and use of Cu₂Cl₂ reactn. (yields: 70% (26), 25% (27)) (1) (8) (28) see indic. refs.; from o-phenylenediamine [Beil. XIII-6, XIII₁-(5)] via tetrazotization in AcOH with nitrosylsulfuric acid followed by use of Cu₂Cl₂ reactn. (70.1% yield) see (29); from 1,2-dichlorobenzenesulfonic acid-4 (see below) by distn. from strong H₂SO₄ with superheated steam at 200-240° see (30).]

[For formn. of $\bar{\mathbf{C}}$ from 2-chlorophenol (3:5980) by htg. with PCl₅ (20% yield) see (7); from o-bromonitrobenzene [Beil. V-247, V₁-(131)] with PCl₅ in s.t. at 180° (31) or with NH₄Cl in s.t. at 320° (32) see indic. refs.; from o-dinitrobenzene [Beil. V-257, V₁-(135)] with conc. HCl in s.t. at 250-270° see (33).]

[For formn. of $\bar{\mathbf{C}}$ (together with m- and p-isomers in some cases) from $\mathbf{C}_0\mathbf{H}_0$ with \mathbf{Cl}_2 in pres. of \mathbf{I}_2 (7), AlCl₃ (34) (35), or SnCl₄ (36) see indic. refs.; from chlorobenzene (3:7903) with \mathbf{Cl}_2 + cat. at 600° (11) cf. (37) or with \mathbf{Cl}_2 in pres. of Al/Hg (38), AlCl₃ (gives 30% $\bar{\mathbf{C}}$ (11)) (34), FeCl₃ (gives 39% $\bar{\mathbf{C}}$ (11)), or with $\mathbf{Al}_2\mathbf{S}_2\mathbf{Cl}_3$ (i.e., 2AlCl₃ + $\mathbf{S}_2\mathbf{Cl}_2$) + SO₂Cl₂ (8a) see indic. refs.]

[C with Cl₂ in pres. of Al/Hg (38) or FeCl₃ (39) (40) (41) gives mainly 1,2,4-trichlorobenzene (3:6420), but 1,2,3-trichlorobenzene (3:0990) is also formed (41). — C with Cl₂ in s.t. at room temp. in sunlight as directed (42) adds 3Cl₂ yielding o-dichlorobenzene-hexachloride, m.p. 149° (42).] — [For study of photochem. chlorination of C see (43).]

[\bar{C} with Mg in dry ether does not react (44).] — [\bar{C} with CO + cat. at elev. temps. gives (45) benzoic acid, presumably through intermediate forms. of o-phthalic acid and subsequent loss of CO₂.]

[\bar{C} with isopropyl alc. (1:6135) + BF₃ + P₂O₅ under reflux gives (53% yield (87)) 3,4-dichlorocumene (3,4-dichloro-isopropylbenzene) (87).]

[\bar{C} with CH₃Cl (3:7005) + AlCl₃ yields (30) hexamethylbenzene (1:7265) + esotrichloromesitylene (3:8725). — \bar{C} (3+ moles) with CHCl₃ (1 mole) + AlCl₃ without solv. at 55° for 8 hrs. gives (15% yield on the CHCl₃ (46)) tris-(3,4-dichlorophenyl)methane, white pl., m.p. 160.5-162° (46). — \bar{C} with CCl₄ + AlCl₃ presumably yields 3,4,3',4'-tetrachlorobenzophenone dichloride (not isolated) since the reaction prod. with 95% alc. (46) or AcOH/H₂SO₄ (47) gives 3,4,3',4'-tetrachlorobenzophenone, cryst. from hot alc. or hot acetone, m.p. 141-142° (46), 142° (47) (accompanied in latter case (H₂SO₄) by some 3,4-dichlorobenzoic acid (3:4925), m.p. 203° (47).]

[\bar{C} with acetyl Cl (3:7065) + AlCl₃ gives (yields: 70% (49), 40% (48)) 3,4-dichloro-acetophenone, b.p. 135° at 12 mm. (48), m.p. 76° (48), 74° (49) (corresp. oxime, m.p. 107° (50)). — \bar{C} with chloroacetyl chloride (3:5235) + AlCl₃ gives (50) (85) 3,4-dichloro-phenacyl chloride (3,4, ω -trichloroacetophenone), m.p. 43° (50), 44° (85). — \bar{C} with β -chloro-n-butyric acid (3:0035) + AlCl₃ or cone. H₂SO₄ yields (51) by condens. and subsequent ring closure a mixt. of x,y-dichloro-3-methylindanone-1 cpds.]

[C with phthalic anhydride (1:0725) + AlCl₃ gives (yields: 80% (5), 73% (52) (53), 35% (54)) (55) o-(3,4-dichlorobenzoyl)benzoic acid, m.p. 194.5° cor. (54), 192.5° (5), 191.2° cor. (52), 190° (55); this prod. on ring closure with conc. H₂SO₄ gives a mixt. of two dichloroanthraquinones consisting of 87% (54) (5) 2,3-dichloroanthraquinone [Beil. VII₁-(413)], m.p. 271° cor. (54), 268° (5), and 13% (54) (5) 1,2-dichloroanthraquinone [Beil. VII₁-(411)], m.p. 196.5° cor. (54), 194.5° (5). Note that C reacts with phthalic anhydride much more readily than p-dichlorobenzene (3:0980); after making reactn. mixt. alk. any p-dichlorobenzene (as from use of crude \tilde{C}) may be distilled out with steam (use in sepn. of p-dichlorobenzene from C (86)); note also the claim (86) that under certain conditions C with phthalic anhydride + AlCl₃ is claimed to replace 1 chlorine atom by hydrogen so that an o-(x-chlorobenzoyl) benzoic acid results which on ring closure with 100% H₂SO₄ gives 80% yield 2-chloroanthraquinone (3:4922). — C with 4,5-dichlorophthalic anhydride (3:4830) + AlCl₃ gives (80% yield (56)) 2-(3,4-dichlorobenzoyl)4,5dichlorobenzoic acid, cryst. from C₆H₆, m.p. 183° (56); this prod. with conc. H₂SO₄ ringcloses giving mainly 2,3,6,7-tetrachloroanthraquinone, m.p. 348° (56), accompanied by a little 1,2,6,7-tetrachloroanthraquinone, m.p. 242° (56).]

[Č on partial hydrol. with aq. MeOH alk., alk. carbonates, or best alk. earths in pres. of Cu or Cu salts at elevated temps. under press. gives in excellent yields (57) (58) (59) (60)

(61) (62) (63) (64) (65) o-chlorophenol (3:5980) (some phenol (1:1420) is also formed (62)); if the hydrolysis of \tilde{C} is carried further, especially by use of aq. alk. in pres. of Ba or Sr salts and a reducing agt. (66), pyrocatechol (1:1520) is obtd. cf. (59) (61) (64).] — [For study of kinetics of reactn. of \tilde{C} with NaOMe/MeOH at 175° see (67) (68) (69).]

 $[\bar{C}$ with anhyd. NH₃ in alc. in pres. of CuCl₂ + Cu at 200° under press. yields (70) o-chloroaniline; \bar{C} with conc. aq. NH₄OH in pres. of CuO under press. at 150-200° (71) (72) or with Na in liq. NH₃ (73) gives o-phenylenediamine.] — $[\bar{C}$ with K diphenylamine gives by rearr. on htg. (74) (75) N,N,N',N'-tetraphenyl-m-phenylenediamine [Beil. XIII-42], m.p. 137.5-138° (74) (75).]

[\bar{C} on mononitration, e.g., at 0° with a mixt. of HNO₃ (D=1.52) + conc. H₂SO₄ (75) cf. (15) (4), gives (yields: 95% (15), 67% (75)) (7) (8) (76) mainly 1,2-dichloro-4-nitro-benzene [Beil. V-246, V₁-(131)], cryst. from alc., m.p. 43° (7) (8), 42.5° (4) (reactn. prod. with piperidine is 2-chloro-4-nitropiperidinobenzene, m.p. 47-48° (78)), accompanied by a little (5.2% at -30°, 7.2% at 0° (8)) 1,2-dichloro-4,5-dinitrobenzene (see below).] — [The only other possible mononitro-isomer, viz., 1,2-dichloro-3-nitrobenzene [Beil. V-245, V₁-(130)], m.p. 61°, has been obtd. only by indirect means (77) (76) although prob. present (4) in the oil from the main mononitration product.]

[\tilde{C} on dinitration, e.g., with 4 wt. pts. HNO₃ (D=1.52) + 6 wt. pts. conc. H₂SO₄ at 100° for 1 hr. (79) (28) cf. (80) (or the above 1,2-dichloro-4-nitrobenzene with HNO₃ (D=1.5) + fumg. H₂SO₄ (20% SO₃) 2 hrs. at 100° (78), gives 1,2-dichloro-4,5-dinitrobenzene [Beil. V-265], cryst. from dil. AcOH, m.p. 109-110° (78), 110° (28) (79) (reactn. prod. with piperidine is 1,2-dichloro-4-nitro-5-piperidinobenzene, m.p. 62-64° (78), accompanied (28) by a little 1,2-dichloro-3,5-dinitrobenzene [Beil. V₁-(138)], m.p. 56° (28).] – [All the other possible isomeric σ -dichlorodinitro cpds. are known but have been obtd. only by indirect means: 1,2-dichloro-3,4-dinitrobenzene [Beil. V-264], m.p. 53-55°, 1,2-dichloro-3,6-dinitrobenzene, m.p. 60°, and 1,2-dichloro-4,6-dinitrobenzene, m.p. 56°.]

[None of the four possible 1,2-dichloro-trinitrobenzenes appears to have been reported.] [\bar{C} on monosulfonation, e.g., with fumg. H_2SO_4 in s.t. at 210° for 8 hrs. (7), or at room temp. (30), or at 100° (10), or with H_2SO_4 . H_2O + fumg. H_2SO_4 (60% SO_3) in pres. of Hg at 100° for 1 hr. (81), gives mainly 1,2-dichlorobenzenesulfonic acid-4 [Beil. XI-55, XI₁-(16)] (Na salt less sol. aq. (81)) accompanied by a lesser amt. of 1,2-dichlorobenzenesulfonic acid-3 (Na salt more sol. aq. (81)) (some bis-(dichlorobenyl) sulfone, m.p. 173° (30), may also be formed during sulfonation).] — [\bar{C} sulfonates much more readily than p-dichlorobenzene (3:0980); for use in sepn. see (7) (30); for removal of chlorobenzene from mixt. with dichlorobenzenes via sulfonation of former with 95% H_2SO_4 see (11).]

₱ 1,2-Dichlorobenzenesulfonamide-4 (3,4-dichlorobenzenesulfonamide-1): cryst. from dil. alc., m.p. 134-135° u.c. (83). [From C by treatment as directed (83) with ClSO₂H followed by conv. of the intermediate 1,2-dichlorobenzenesulfonyl chloride-4, m.p. 18-19° (83), with (NH₄)₂CO₃ to the desired sulfonamide.] — [For formn. of 3,4-dichlorobenzenesulfonyl chloride with ClSO₃H and use in sepn. of C̄ from p-dichlorobenzene see (82); for prepn. of the sulfonamide and use as plasticizer see (84).]

3:6060 d,l-2,3-DICHLOROPROPANOL-1
$$CH_2Cl$$
 $C_3H_6OCl_2$ Beil. I - 356 (Glycerol α,β -dichlorohydrin; $H-C-Cl$ $I_1-(181)$ alcohol dichloride) CH_2OH

B.P. 182° at 760 mm. (1)
$$D_4^{20} = 1.3534$$
 (5) 182° (2) (3) (8) 179–181° sl. dec. (4) $D_0^{18} = 1.345$ (4) $n_D^{18} = 1.4875$ (4) 81–81.5° at 13.5 mm. (5) 75–77° at 15 mm. (6)

Colorless visc. liq.; spar. sol. cold aq., pet. ether; misc. with alc., ether, acetone, C_6H_6 . [For prepn. of \bar{C} from glycerol (1:6540) (together with other prods.) see (1); for prepn. from allyl alcohol (1:6145) with Cl_2 + aq. (2) (7) (8) (5) (20% yield) or with Cl_2 in CS_2 (40% yield (9)) see indic. refs.; from allyl chloride (3:7035) by addition of HOCl see (10) (11) (12); from the corresp. acetate (β , γ -dichloro-n-propyl acetate) (3:6220) by alcoholysis using MeOH + HCl (33% yield (4)) (6); from vinyl chloride (3:7004) by reactn. with formaldehyde (30% soln.) + HCl + CaCl₂ see (13).]

 \bar{C} with aq. alk. loses HCl yielding (14) 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358). [For studies of kinetics of this loss of HCl with aq. alk. see (15); for use of Ba(OH)₂ hydrol. as means of detn. of \bar{C} in pres. of 1,3-dichloropropanol-2 (" α -dichlorohydrin") (3:5985) see (16).]

Č with sodium phenolate does *not* give the expected 2,3-diphenoxypropanol-1 but instead (4) (presumably by intermediate formation of epichlorohydrin (3:5358)) the isomeric 1,3-diphenoxypropanol-2, [Beil. VI-149, VI₁-(86)], m.p. 79° (4).

 \bar{C} on oxidn. with conc. HNO₃ (D=1.47) yields (12) (17) (6) (18) α,β -dichloropropionic acid (3:0855), m.p. 50°. [\bar{C} on reductn. with P + HI at 180° yields (8) isopropyl iodide + isopropyl chloride.]

[\bar{C} with SOCl₂ at 100° gives (85% yield (19)) bis-(β,γ -dichloro-n-propyl) sulfite, b.p. 175° at 4 mm., D_0^{23} 7 = 1.501, n_D^{23} = 1.509 (19); \bar{C} with SO₂Cl₂ gives (75% yield (19)) 2,3-dichloropropane-sulfonyl chloride-1, b.p. 122-123° at 15 mm., $D_0^{20.5}$ = 1.582, n_D^{23} = 1.457 (19).]

[\bar{C} with PCl₅ yields (7) 1,2,3-trichloropropane (3:5840); \bar{C} with NaCN gives (20) (presumably by formation and subsequent reaction of epichlorohydrin) 25% yield γ -chloro- β -hydroxy-n-butyronitrile; for reactn. of \bar{C} with NH₃ see (21); for reactn. of \bar{C} with Na₂S, NaSH, etc., yielding thioglycerols see (22).]

- —— β,γ-Dichloro-n-propyl acetate: b.p. 192° (see 3:6220). [For general study of kinetics of esterification of C̄ see (3).]
- ---- $\beta_{,\gamma}$ -Dichloro-n-propyl benzoate: oil, b.p. 180-183° at 24 mm. (4).
- \mathfrak{D} β,γ -Dichloro-n-propyl p-nitrobenzoate: m.p. 37-38° (4), 35.5-37° (23). [From $\tilde{\mathbf{C}}$ + p-nitrobenzoyl chloride + pyridine (23).]
- —— $\beta_{,\gamma}$ -Dichloro-n-propyl 3,5-dinitrobenzoate: unreported.
- $\beta_{,\gamma}$ -Dichloro-n-propyl benzenesulfonate: unreported.
- ---- $\beta_{,\gamma}$ -Dichloro-n-propyl p-toluenesulfonate: unreported.
- $\mathfrak{G}_{,\gamma}$ -Dichloro-n-propyl N-phenylcarbamate: cryst. from lgr., m.p. 72-73° (24), 73-74° (25). [From $\ddot{\mathbf{C}}$ + phenyl isocyanate at 90° (24) or indirectly from $\beta_{,\gamma}$ -dichloro-n-propyl chloroformate with aniline (25).]
- Φ $\beta_{\gamma\gamma}$ -Dichloro-n-propyl $N-(\alpha$ -naphthyl)carbamate: ndls. from alc., m.p. 93° (25).

[Prepd. indirectly from β, γ -dichloro-n-propyl chloroformate with α -naphthylamine

① β,γ -Dichloro-n-propyl N-(β -naphthyl)carbamate: lfts. from alc., m.p. 99° (25). [Prepd. indirectly from β, γ -dichloro-n-propyl chloroformate with β -naphthylamine

3:6075 1,1,2,3,3-PENTACHLOROPROPENE-1 Cl
$$C_3HCl_5$$
 Beil. I - 200 Cl_2C —C.CHCl₂ I_1 -(83) I_2 —B.P. 183° (1) $D_4^{34} = 1.6317$ (1) $n_D^{20} = 1.5313$ (1) 116° at 9 mm. (1)

 $\ddot{C} + Br_2$ in sunlight gives (1) 1,2-dibromo-1,1,2,3,3-pentachloropropane, m.p. 71° (1). Č with powdered KOH in toluene at 100° yields (1) a prod. C₆Cl₈, colorless ndls., m.p. 93-94° (1).

Č shaken with conc. H_2SO_4 , poured onto ice, yields 2,3,3-trichloropropen-2-al-1 $(\alpha,\beta,\beta$ trichloroacrolein) [Beil. I₁-(378)], b.p. 164° (1), m.p. 10° (1). [Oxime, m.p. 101°, converted on fusion into stereoisomer, m.p. 132° (1); phenylhydrazone, yel.-br. ndls., m.p. 97-98° dec. (1).

 \bar{C} with conc. H₂SO₄ for a longer time at 40-50°, poured onto ice, ppts. (1) α,β -dichloroacrylic ac. (3:2265), m.p. 86° (1).

3:6075 (1) Prins, J. prakt. Chem. (2) 89, 419-420 (1914).

3: 6085 1,1,1,3-TETRACHLOROPROPANONE-2
$$C_3H_2OCl_4$$
 Beil. I - 656 (unsym.-Tetrachloroacetone) CH_2 — C — CCl_3 I₁— I₂— B.P. 183° (1) $D_4^{15} = 1.624$ (1) $n_D^{18} = 1.497$ (1) 180–182° (2) 71–72° at 13 mm. (3)

[See also 1,1,3,3-tetrachloropropanone-2 (3:6050).]

Colorless limpid liq.; odor faint by itself but on warming or on dilution with ether shows

lachrymatory props. — \tilde{C} with aq. readily yields (1) (2) (3) (4) a crystn. tetrahydrate, m.p. 46° (1), 39° (2), 65° (3).

[For prepn. of C from isopropyl alc. (propanol-2) (1:6135) with Cl₂ in cold see (1); from acetone (1:5400) with Cl₂ see (2) (4) (5); from chloroacetone (3:5425) with Cl₂ at 50-70° in light see (6); from 1,1,1-trichloropropanone-2 (3:5620) with SOCl₂ at 180° see (3).]

Č reduces NH₄OH/AgNO₃, Fehling's soln., or aq. KMnO₄ instantly in cold (1) but does not give fuchsin-aldehyde test (1).

 $\ddot{\mathbf{C}}$ with NH₄OH (1) yields chloroform (3:5050) and chloroacetamide [Beil. II-199, II₁-(90), II₂-(193)], m.p. 116-117°.

C with aq. KOH yields (1) chloroform (3:5050) together with the salts of both chloroacetic acid (3:1370) and trichloroacetic acid (3:1150). [Dif. from the isomeric sym.tetrachloroacetone (3:6050).]

 $\ddot{\mathbf{C}}$ with aq. KOH + aniline yields (5) phenyl isocyanide (carbylamine reaction). [Dif. from the isomeric sym.-tetrachloroacetone (3:6050).]

3:685 (1) Brochet, Bull. soc. chim. (3) 13, 117-120 (1895); Ann. chim. (7) 10, 134-141 (1897); Compt. rend. 119, 1271 (1894). (2) Cloëz, Ann. chim. (6) 9, 180-182 (1886). [See also chloromaleyl (di)chloride (3:6158).]

Pale green oil (2).

[For prepn. of \bar{C} from d_il -tartaric acid (1:0550) or (less advantageously) d-tartaric acid (1:0525) with PCl₅ (large excess) at 100° (yield from d_il -tartaric acid 80% (1), from d-tartaric acid 48% (9)) (10) (11) (12) (3) see indic. refs. (note that care must be taken to ensure removal of all traces of phosphorus chlorides (9)); from acetylenedicarboxylic acid [Beil. II-801, II₁-(317), II₂-(670)] with PCl₅ in AcCl in s.t. shaken at room temp. for 45 hrs. (yield not stated (6)) or with PCl₅ directly (41% yield (5)) see indic. refs.]

[For formn. of \bar{C} to small extent from chloromaleyl (di)chloride (3:6158) on protracted boilg. see (2); for formn. of \bar{C} from succinyl (di)chloride (3:6200) during actn. of Cl_2 see (13); for formn. of \bar{C} (as an inseparable mixt. with BzCl) from dibenzoyl-d-tartaric anhydride with PCl₅ see (14).]

[Č with Cl₂ in pres. of Fe gives (16) dichloromaleyl (di)chloride (3:6197) q.v. — Č with Br₂ in dark does not react, but in direct sunlight for 5 hrs. adds 82% of theoretical amt. yielding (2) α -chloro- α , β -dibromosuccinyl (di)chloride, b.p. 116–118° at 10 mm. (2), which on hydrolysis with aq. gives (2) α -chloro- α , β -dibromosuccinic acid, hydrated pr. from HCl, m.p. 65–75°, which after drying over conc. H₂SO₄ gives anhydrous form, m.p. 139–140° (2).]

[\bar{C} with 3 N EtOH/KOH (large excess) in freezing mixt. loses HCl and hydrolyzes (or vice versa) and after acidification as directed gives K H acetylenedicarboxylate which with aq. at 100° for 1 hr. loses CO₂ giving (39% yield from \bar{C} (12)) propiolic acid [Beil. II-477, II₁-(208), II₂-(449).]

[C with MeOH under reflux yields (13) dimethyl chlorofumarate (3:6582); C with EtOH yields (1) (9) (15) diethyl chlorofumarate (3:6864); note that C reacts with MeOH or with aniline much more rapidly than the isomeric chloromaleyl (di)chloride (3:6158) (for details and graphs see (2)).]

C (1 mole) with chlorofumaric acid (3:4853) (1 mole) at 125° for 1 hr. gives (11) chloromaleic anhydride (3:0280), m.p. 33°.

[Č with AlCl₃ combines yielding a viscous oil, solidifying in freezing mixt. to yel. cryst., m.p. about 50°; this prod. with water regenerates Č but if first htd. at 100° for several hrs. and then treated with aq. gives (85-87% yield (2)) (3) chloromaleyl (di)chloride (3:6158).]

 $\ddot{\mathbf{C}}$ with excess conc. aq. NH₄OH reacts vigorously yielding (1) (11) chlorofumaric acid diamide, ndls. from alc., m.p. 187° (11).

[\tilde{C} in aq. AcOH (1:4) with hydrazine hydrate as directed gives hydrazine salt of N,N-bis (α -chloro- β -carboxyacryloyl)hydrazine (?), m.p. 218° (9); note that \tilde{C} with NH₂.NH₂.H₂O in ether, pet. eth., or AcOH gives only (9) resinous or amorphous yel. prods.]

Č (1 mole) with p-chloroaniline (4 moles) in dry ether reacts vigorously giving mainly (11) chlorofumaro-di-p-chloroanilide, pale yel. ndls. from alc., m.p. 223° (11), accompanied by a little N-(p-chlorophenyl)chloromaleimide, pl. from alc. mother liquor, m.p. 175° (11). Č on hydrolysis with aq. yields chlorofumaric acid (3:4853), m.p. 193°.

C₈H₅O₂Cl

Colorless liq. with weak odor suggestive both of acetic acid and butyric acid; misc. with aq. alc. or ether; volatile with steam; blisters skin.

[For prepn. of \bar{C} from propionic acid (1:1025) with Cl_2 (7) (8) or with SO_2Cl_2 + dibenzoyl peroxide in CCl_4 (9) see indic. refs.; from α -chloropropionyl chloride (3:5320) by hydrolysis (1) (10) (11) (12) with water see indic. refs.; from α -chloropropionitrile by hydrolysis with conc. HCl see (5); from 2-chloropropanol-1 (3:7917) (4) or from 3-chlorobutanone-2 (α -chloroethyl methyl ketone) (3:7598) (13) (14) by oxidn. with HNO₃ or other oxidn. agts. see indic. refs.]

[\bar{C} on treatment with Cl₂ as specified (15) yields α,β -dichloropropionic acid (3:0855); \bar{C} with SOCl₂ yields (16) α -chloropropionyl chloride (3:5320), b.p. 111°; \bar{C} on reduction with Zn + HCl yields (10) propionic acid (1:1025) [for study of catalytic hydrogenation of \bar{C} or its salts see (17)]; \bar{C} with SO₃ at 170° yields (18) α -chloro- α -sulfopropionic acid [for reactn. of \bar{C} with sulfites see (2)]; \bar{C} with conc. aq. NH₄OH gives (43-46% yield (19)) d₃l-alanine (α -aminopropionic acid) [for behavior of \bar{C} with liq. NH₃ see (20) (21)].]

 \bar{C} on alk. hydrolysis gives (10) (22) lactic acid (1:0400) [for study of rate of hydrolysis of \bar{C} (23) or its sodium salt (24) see indic. refs.].

[C on htg. with pyridine at 100° loses CO₂ and yields (25) ethylpyridinium chloride.]

Č on conversion to salt, treatment with KCN, and subsequent acidification yields (26) methylmalonic acid, m.p. 132° (has been used for ident. of Č (26)).

 \tilde{C} with o-phenylenediamine in 5 N HCl refluxed 3 hrs. gives (yields: 61-64% (35), 55-60% (36)) 2 (α -chloroethyl)benzimidazole, ndls. from hot C_6H_6 , m.p. 134.7-135.4° cor. (35) 134-135° cor. (36).

- Methyl α -chloropropionate: b.p. 132°. (See 3:7908.)
- Ethyl α-chloropropionate: b.p. 147°. (See 3:8125.)
- Φ α-Chloropropionamide: m.p. 80° (27). [From ethyl α-chloropropionate (3:8125) with conc. aq. NH₄OH (27).]
- α-Chloropropion-anilide: lfts. from lgr., m.p. 92° (28) (9). [From α-chloropropionyl chloride (3:5320) + aniline in CHCl₃ (28).] [Note that the reactn. prod. of this compd. with more aniline, viz., α-anilinopropionanilide [Beil. XII-558], has m.p. 126°.]
- **D** Phenylhydrazine α -chloropropionate: m.p. 95° (30). [From \bar{C} + phenylhydrazine (30).]
- \bigcirc α -Phenoxypropionic acid: ndls. from aq., m.p. 115-116° (31), 115° (32). [From sodium α -chloropropionate + sodium phenolate on htg. and evapn. (33).] [Note that the opt. act. forms of this deriv. melt at 87° (32).]

3:6150 1,2,3,4-TETRACHLOROBUTADIENE-1,3
$$C_4H_2Cl_4$$
 Beil. S.N. 12 (Liquid stereoisomer) $HC = C - C = CH$

$$Cl Cl Cl Cl$$

B.P.
$$188^{\circ}$$
 (1) $D_{15}^{15} = 1.516$ (1) $67-68^{\circ}$ at 10 mm. (1) 43° at 1 mm. (1)

[See also the solid stereoisomer (3:0870), m.p. 50°.]

Colorless strongly refractive liq. with agreeable honey-like odor; on stdg. turns brown and evolves HCl.

[For isolation of \bar{C} from the high-boilg, fractn. resulting in the preparation of trichloroethylene (3:5170) from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) see {1}; for prepn. of \bar{C} from 1,1,2,3,4,4-hexachlorobutane (3:3155) with alc. KOH at room temp. see {1}.

C on saturation with Cl2 yields (1) the liquid stereoisomer of 1,1,2,3,4,4-hexachlorobutene-

2 (3:9046), b.p. 97° at 10 mm. (1). [Note that \tilde{C} does not (1) yield octachlorobutane (3:2000).]

C with Br₂ yields 1,4-dibromo-1,2,3,4-tetrachlorobutene-2, long colorless doubly refracting ndls., m.p. 105° (1).

C does not react with conc. HNO₃, but with fumg. HNO₃ or even with NO₂ gas C reacts vigorously pptg. 1,4-dinitro-1,2,3,4-tetrachlorobutene-2, colorless cryst. from AcOH, m.p. 131° (1). [Note that this prod. cannot be recryst. from alc. since it reacts yielding ethyl nitrite and a yel. viscous oil (1).]

3:6150 (1) Muller, Huther, Ber. 64, 589-600 (1931); C.A. 25, 3956 (1931).

B.P. M.P. 189.3° at 760 mm. (1) 12.7° (1)
$$D_4^{20} = 1.602$$
 (3) $n_D^{20} = 1.5126$ (3) 186.3° at 760 mm. (1) 11-12° (2) 185.2° at 730 mm. (1) $D_4^{18} = 1.6049$ (3) $n_D^{18} = 1.51362$ (3) 104.0-105° at 50 mm. (2) 82.2-82.5° at 26 mm. (3) $D_4^{17} = 1.6044$ (3) $n_D^{17} = 1.51375$ (3) 71.5° at 10 mm. (1)

[See also chlorofumaryl (di)chloride (3:6105).]

Č is generally formulated in the unsymmetrical structure shown above (for discussion see (1) (2)); note, however, that the position of the chlorine atom attached to the carbon bearing the double bond is frankly assumed and may be on the other such carbon.

Note also that \bar{C} appears to exist also in a labile form, m.p. 4.8° (1), which readily changes to the higher-melting (stable) variety; \bar{C} on supercooling and inoculation with the labile form cryst, in the latter.

Č from pet. ether cryst. as needles; Č has disagreeable odor (1) and is far more lachrymatory than the isomeric chlorofumaryl (di)chloride (3:6105) (2).

[For prepn. of \tilde{C} from chlorofumaryl (di)chloride (3:6105) by combination with AlCl₃, htg. at 100° for several hrs., and subsequently decomposing with ice water (yield as high as 85-87% but varies according to nature of AlCl₃ used) see (1) (2).]

[C on hydrogenation in dry ether in pres. of Pt black yields (4) n-butyric acid (1:1035) and other prods.]

[\tilde{C} with AlCl₃ gives a cpd., red-brown ndls., m.p. abt. 100° (1); on htg. at 180-225° this prod. decomposes yielding (1) α,β -dichloroacryloyl chloride (see under 3:2265), b.p. 147.3° at 733 mm., phosgene (3:5000), CO, HCl, and other prods.]

C on protracted boilg. is converted (1) to chlorofumaryl (di)chloride (3:6105).

[Č reacts with MeOH and with aniline much more slowly than the isomeric chlorofumaryl (di)chloride (3:6105) (for details and graphs see (1) cf. (2)).]

3:6158 (1) Ott, Ann. 392, 256-265, 278-285 (1912). (2) Dann, Davies, Hambly, Paul, Semmens, J. Chem. Soc. 1933, 15-21. (3) von Auwers, Schmidt, Ber. 46, 482 (1913). (4) Ott., Ber. 46, 2173-2175 (1913).

3:6162
$$\alpha,\alpha$$
-DICHLOROPROPIONIC ACID Cl $C_3H_4O_2Cl_2$ Beil. II - 250 II_1 — II_2 -(228) Cl_3 —C—COOH II_1 — II_2 -(228) Cl_3 —C C

Colorless liq. — Very eas. sol. aq. or alc.; from aq. solns. can be salted out with NaCl. — Volatile with steam without hydrolysis. — Insol. conc. HCl.

[For prepn. of \bar{C} from corresp. acid chloride, viz., α,α -dichloropropionyl chloride (3:5372), by hydrolysis see (3); from α,α -dichloropropionitrile monomer [Beil. II-251] (1) (4) (19), α,α -dichloropropionitrile dimer [Beil. II-252] (5), or α,α -dichloropropionitrile trimer [Beil. XXVI-38] (6) (7) by hydrolysis with H₂SO₄ see indic. refs.; from α,α -dichloropropionanilide (see below) by hydrolysis with conc. HCl in s.t. at 140° see (2); for formn. of \bar{C} from propionic acid with Cl₂ under certain conditions see (26).]

 \overline{C} is reduced by Zn + dil. H_2SO_4 giving (1) propionic acid (1:1025).

 \bar{C} on keeping gradually splits off some HCl (2). — \bar{C} with alc. KOH on boilg. either loses HCl giving (8) α -chloroacrylic acid (3:1445) or by some obscure mechanism gives (9) cf. (10) (11) β -ethoxyacrylic acid [Beil. III-369], m.p. 110°.

 \bar{C} as a monobasic acid forms corresp. salts; e.g., NH₄ \bar{A} (1); KA.6H₂O (1); Ca \bar{A}_2 .3H₂O (1); Ba \bar{A}_2 .H₂O (1); Zn \bar{A}_2 .H₂O (1) (12); Ag \bar{A}_3 , spar. sol. aq. (1); note that this dry Ag \bar{A}_3 at 60° decomposes violently giving (12) AgCl and a mixed anhydride of \bar{C} with pyruvic acid, viz., CH₃.C(Cl₂).CO.O.CO.CO.CO.H₃; however, Ag \bar{A}_3 on warming with aq. gives (12) AgCl + pyruvic acid (1:1040) and/or (1) α -chloroacrylic acid (3:1445).

 \tilde{C} with aq. Ag₂O or Ag₂CO₃ on protracted htg. gives (13) (12) pyruvic acid (1:1040), but use of excess Ag₂O (14) (1) cf. (15) leads to AcOH (1:1010) + CO₂ + H₂O. — \tilde{C} with aq. Ba (OH)₂ on boilg. or \tilde{C} with aq. in s.t. at 120–150° gives (14) (16) pyruvic acid (1:1040).

[\bar{C} with finely divided Ag in C_6H_6 on refluxing 40–70 hrs. gives (17) (18) (19) α,α' -dimethylmaleic anhydride [Beil. XVII-445], m.p. 95°, and α,α' -dichloro- α,α' -dimethylsuccinic acid [Beil. II-668], m.p. 185°.]

[$\bar{\mathbb{C}}$ (3 moles) with PCl₃ (1 mole) gives (3) (20) α,α -dichloropropionic acid anhydride [Beil. II-251], b.p. 196-200° (20), 190-192° (3). — $\bar{\mathbb{C}}$ (3 moles) with PCl₃ (2 moles) (3) or with SOCl₂ refluxed for 10 hrs. (21) gives α,α -dichloropropionyl chloride (3:5372).

C with alcohols in pres. of dry HCl gives (1) the corresp. esters (see also below).

- Methyl α,α-dichloropropionate: b.p. 144-146° (7), 143-144 u.c. (1). [From C with MeOH + dry HCl (1) (7); for study of kinetics of hydrolysis see (22).]
- Ethyl α,α-dichloropropionate: b.p. 160° (23), 156-157° (1) (6), 83-85° at 53 mm. (2).
 [From C with EtOH + dry HCl (1) or from α,α-dichloropropionyl chloride (3:5372) with EtOH (23); note that this ester with aq. in s.t. at 130° gives (16) (14) undergoes hydrolysis yielding pyruvic acid (1:1040) and ethyl pyruvate (1:3308) or with aq. Ag₂O gives (15) Ag acetate.]
- Φ α,α-Dichloropropionamide: lfts. from dil. alc., m.p. 117-118° (2) (24), 117° (12), 116-117° (3), 116° (23) (5) (20), 115-116° (4) (6) (7). [From ethyl α,α-dichloropropionate (above) (3) (23), from methyl α,α-dichloropropionate (above) (7), or from α,α-dichloropropionyl chloride (3:5372) (3) with conc. aq. NH₄OH.]
- D α.α-Dichloropropion-N-ethylamide: m.p. 51-52° (2). [From C with EtNH₂.]
- α,α-Dichloropropionanilide: m.p. 101° (2). [Reported only by indirect means (2).]
 α,α-Dichloropropion-p-toluidide: m.p. 84-86° (25). [Reported only by indirect means (25).]

[See also dichloromaleic acid (3:3634) and dichloromaleic anhydride (3:3635).]

Colorless mobile lachrymatory liq. with penetrating camphoraceous odor but *not* fumg. in moist air. — Insol. aq. but volatile with steam without hydrolysis. — Soluble in org. solvents.

Although C has not been separated into the completely pure desmotropic forms (A) and (B), their presence is clearly evidenced (2). The relative proportion of the two forms varies with the age of the sample and other conditions, but the above data on density and refraction indicate the extremes so far realized (for much further detail see (2)).

[For prepn. of ord. \bar{C} (mixt. of (A) and (B)) from succinyl (di)chloride (3:6200) with Cl₂ at 145° in pres. of Fe (81% yield) see (2) (note that some dichloromaleic anhydride (3:3635) is also formed, that in absence of Fe the reactn. is very slow, and that use of I₂ in place of Fe lowers yield of \bar{C} to 54% (2)); from chlorofumaryl (di)chloride (3:6105) with Cl₂ in pres. of Fe see (1); from dichloromaleic anhydride (3:3635) with PCl₅ see (1); from dibromofumaryl (di)chloride [Beil. II₁-(303)] with AlCl₃ at 100° see (3).]

Ord. Č with 60% of its wt. of AlCl₃ spontaneously evolves ht.; after further htg. at 100° and pouring into aq. the ethereal extract yields (2) a prod. which reacts as substantially pure *unsym*. form (B).

Ord. \bar{C} is not affected by ord. treatment with boilg. aq. or boilg. aq. KOH (2), although it is attacked by alc. KOH (1). — \bar{C} on very protracted (168 hrs.) boilg. with aq. slowly dissolves giving (2) an acidic soln. which on extraction with ether followed by drying and evapn. of this solvent gives (80% yield) dichloromaleic anhydride (3:3635).

[For study of rate of reactn. of C with MeOH or with aniline see (2).]

[For condens. of \bar{C} with 1-aminoanthraquinone in prepn. of dyestuffs see (2) (4).]

Ord. \bar{C} (2 g.) in C_6H_6 (150 ml.) treated with 4 moles aniline (3.4 g.) in C_6H_6 (30 ml.) immediately ppts. aniline hydrochloride; after stdg. for $\frac{1}{2}$ hr., then removing this ppt., the filtrate leaves on evapn. a mixt. (m.p. 165-185°; yield 67-83% (2)) of two different dianilides, which can be separated by recrystn. from hot alc.: the dianilide from the sym. dichloride (A) is white, has m.p. 193°, and with alc. KOH is much more slowly hydrolyzed than its isomer and during such hydrolysis shows no transient color; the dianilide from the unsym. dichloride (B) is yellow, has m.p. 170°, and with hot 8% alc. KOH readily hydrolyzes with development of a transient cherry-red coloration. — Note that, although the white dianilide is somewhat more readily sol. in hot alc. than the yellow isomer, it also separates first on slow cooling; note also that on hydrolysis of the anilides with alc. KOH the presence of aniline is readily detected but (presumably because of further attack by the alkali) no dichloromaleic acid can be recovered in either case.

3:6197 (1) Vandevelde, Bull. acad. roy. Belg. (3) **37**, 680-700 (1899); Cent. **1900**, I 404. (2) Leder, J. prakt. Chem. (2) **130**, 255-288 (1931). (3) Ott, Ann. **392**, 271 (1912). (4) Leder, Ger. 558,248, Sept. 3, 1932; Cent. **1932**, II 3789.

Note that \tilde{C} may react in either sym. (above) or unsym. form acc. to circumstances. [For discussion of structure see (1) (5) (7) (9) (10); in the liquid only the sym. form (\tilde{C}) exists (9).] — \tilde{C} is sol. in C_6H_6 , but insol. in pet. ether (7).

[For prepn. of $\bar{\mathbb{C}}$ from succinic acid (1.0530) with PCl₅ (yield: 85% (8) (12)) (13) (14) (4) (5) see indic. refs. (note that neither PCl₃ + ZnCl₂ (8) nor SOCl₂ (16) give $\bar{\mathbb{C}}$); for prepn. of $\bar{\mathbb{C}}$ from succinic anhydride (1.0710) with PCl₅ (4) (6), with PCl₃ + Cl₂ (17), or with SOCl₂ + ZnCl₂ at 200-240° (18) (35) see indic. refs.; for formn. of $\bar{\mathbb{C}}$ from the trimer of β -aldehydopropionic acid with PCl₅ see (19).]

 $[\bar{C} \text{ with } Cl_2$ + Fe at 145° gives (81% yield (20)) dichloromaleyl dichloride (3:6197) cf. (21); \bar{C} with Br₂ yields (22) (23) mixt. of d_{ν} and $meso-\alpha_{\nu}\alpha'$ -dibromosuccinyl dichlorides; \bar{C} with Br₂ + Fe yields (24) dibromomaleic anhydride [Beil. XVII-435, XVII₁-(233)], m.p. 118°.]

[\bar{C} on reduction with Na/Hg + AcOH in ether (25) or with H₂ + Pd (26) (15) gives (54% yield (26)) γ -butyrolactone (1:5070), b.p. 206°.]

[\bar{C} with AlCl₃ + C₆II₆ yields (27) γ , γ -diphenyl- γ -butyrolactone [Beil. XVII-367], m.p. 90° (arising from reactn. of \bar{C} in the *unsym*. form), 1,2-dibenzoylethane [Beil. VII-773, VII₁-(401)], m.p. 144° (arising from reactn. of the *sym*. form), and β -benzoylpropionic acid [Beil. X-696, X₁-(330)], m.p. 116°.]

[\bar{C} on distn. or htg. with succinic acid (1:0530) (30) (31), or on htg. (31) with anhydrous oxalic acid (1:0535) or on protracted boiling with Na in xylene (32), or on htg. with diethyl succinate (1:3756) + $ZnCl_2$ (33), yields succinic anhydride (1:0710), m.p. 120°.]

 \ddot{C} with conc. aq. NH₄OH (7) or with NH₃ gas in C₆H₆ reacts mainly in the *unsym*. form (7) yielding the hygroscopic *unsym*. succindiamide [Beil. XVII-410] with at most 5% of sym.-succindiamide, m.p. 260°; \ddot{C} with aniline in C₆H₆ (7) (34), however, gives 90% yield (7) sym.-succindianilide, m.p. 230°.

[For behavior of C with diethyl sodio-malonate see (35) (36).]

Č on hydrolysis yields succinic acid (1:0530) q.v., m.p. 185°.

[See also ethyl γ -chloroacetoacetate (3:6375).]

30 mm. (6)

Colorless oil with penetrating odor; vapor is strong lachrymator. — \bar{C} can be preserved for some time but on very long stdg. (several years) decomposes (8) with formn. of oxalic acid (1:0445). — \bar{C} is spar. sol. aq., eas. sol. alc., ether.

[For prepn. of \bar{C} from ethyl acetoacetate (1:1710) with SO₂Cl₂ (yields: 85% (7), 55% (6)) (2) or with Cl₂ in diffused light at room temp. (75% yield (9)) or in gas phase at 76–102° and 7 mm. press. (68% yield (40)) see indic. refs.; from the copper enolate of ethyl acetoacetate in CHCl₃ with Cl₂ (67% yield (10)) cf. (11); from ethyl sodioacetoacetate with *p*-toluenesulfonyl chloride in dry ether or lgr. (12); or from ethyl β -(chlorimino)-*n*-butyrate [Beil. III-656] on distillation with dil. H₂SO₄ (13) see indic. refs.]

[\bar{C} can be further chlorinated: e.g., \bar{C} (1 mole) with SO₂Cl₂ (1 mole) gives (1) (2) ethyl α,α -dichloroacetoacetate [Beil. III-663, III₁-(233), III₂-(427)], b.p. 205-207° at 726 mm., 91° at 11 mm. (1), $D_{16,5}^{16} = 1.293$ (14), $n_{17}^{17} = 1.4492$ (1).]

 \bar{C} on hydrolysis with boilg. dil. H_2SO_4 undergoes ketonic splitting yielding (15) chloro-acetone (3:5425) + CO_2 + EtOH (note that this does not distinguish \bar{C} from ethyl γ -chloro-acetoacetate (3:6375) which yields same prods.)

[\bar{C} with alc. NaOC₂H₅ yields (9) ethyl acetate (1:3015), ethyl α -ethoxyacetoacetate, and traces of ethyl chloroacetate (3:5700); \bar{C} with sodium phenolate (free from alc. or aq.) on htg. gives (16) ethyl α -phenoxyacetoacetate (not further described) which in cold conc. H₂SO₄ loses H₂O and ring-closes to 2-carbethoxy-3-methylcoumarone [Beil. XVIII-309], tbls. from C₆H₆, m.p. 51°, b.p. 290° (16); note dif. in behavior of \bar{C} with these reagents as compared with ethyl γ -chloroacetoacetate (3:6375).]

[$\ddot{\mathbf{C}}$ with diethyl sodiomalonate yields in alc. (7) ethyl acetate (1:3015), ethyl chloroacetate (3:5700), triethyl ethane-1,1,2-tricarboxylate [Beil. II-813, II₁-(321), II₂-(681)], and tetraethyl propane-1,2,2,3-tetracarboxylate [Beil. II-862, II₁-(333), II₂-(701)] but in toluene yields (7) triethyl 3-hydroxybuten-2-tricarboxylate-1,1,2 [Beil. III₂-(509)]; note dif. from behavior of ethyl γ -chloroacetoacetate (3:6375).]

[For behavior of Cwith KCN see (4); with ethyl sodiocyanoacetate see (17); with NH₃ in dry ether see (18).]

Note that \tilde{C} is capable of displaying keto enol tautomerism as is shown in the following reactions.

C with FeCl₃ soln. gives intense violet coloration (10) (4).

Č forms a series of metallic salts of the enolic form; these are in general insol. aq. but sol. in org. solvents: e.g., Č in ether on shaking with aq. Cu(OAc)₂ (19) or NH₄OH/CuSO₄ (20) gives Cu(C₆H₃O₂Cl)₂, green tbls. from C₆H₆, m.p. 169-170° (19) (note that this m.p. is

alm. ident. with corresp. deriv. from the isomeric ethyl γ -chloroacetoacetate (3:6375)); for corresp. Mg, Cu, or Ni enolates see (20).

[$\bar{\mathbf{C}}$ with phenols in pres. of conc. $\mathbf{H}_2\mathbf{SO}_4$ or $\mathbf{P}_2\mathbf{O}_5$ undergoes condensation and ring closure with loss of $\mathbf{H}_2\mathbf{O}$ giving the corresp. substituted coumarins: e.g., $\bar{\mathbf{C}}$ with *m*-cresol (1:1730) in conc. $\mathbf{H}_2\mathbf{SO}_4$ at 0° gives (6) 3-chloro-4,7-dimethylcoumarin, ndls. from alc., m.p. 135° (6); $\bar{\mathbf{C}}$ with *p*-cresol (1:1410) similarly (6) (or m small yield (21) with $\mathbf{P}_2\mathbf{O}_5$) gives 3-chloro-4,6-dimethylcoumarin, ndls. from AcOH, m.p. 160° (6), 158° (21): for corresp. reactn. of $\bar{\mathbf{C}}$ with α -naphthol (1:1500) (22) (6), with β -naphthol (1:1540) (23), with 6-chloro-m-cresol (4-chloro-3-methylphenol) (3:1535) (24) see indic. refs. — This type of condensation also occurs with polyhydric phenols: e.g., $\bar{\mathbf{C}}$ with resorcinol (1:1530) + conc. $\mathbf{H}_2\mathbf{SO}_4$ at 0° (25) or with $\mathbf{P}_2\mathbf{O}_5$ in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with $\mathbf{P}_2\mathbf{V}_5$ in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with $\mathbf{P}_2\mathbf{V}_5$ in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with $\mathbf{P}_2\mathbf{V}_5$ in alc. (26) gives 3-chloro-7-hydroxy-4-methylcoumarin, cryst. from alc. with $\mathbf{P}_2\mathbf{V}_5$ in corresp. behavior of $\bar{\mathbf{C}}$ with orcinol (1:1525) (22) (25), with pyrogallol (1:1555) (22) (25), see indic. refs.; many other cases are known. — Note, however, with particular care that $\bar{\mathbf{C}}$ with sodium salts of these phenols reacts in a different manner yielding substituted coumarone derivs. (cf. case of sodium phenolate in fifth paragraph).]

 \bar{C} with aq. solns. of diazonium salts behaves quite differently from the isomeric ethyl γ -chloroacetoacetate (3:6375): e.g., \bar{C} in alc. with aq. benzenediazonium sulfate in pres. of NaOAc (2 moles) yields (27) (28) (4) ethyl α -chloro- α -(phenylhydrazono)acetate [Beil. XV-270], yel. lfts. or pl. from alc., m.p. 80-81° (28) (4), 70-71° (27) (for use of this reactn. on mixts. of \bar{C} with the isomer see (4)).

 \tilde{C} with excess hydrazine hydrate is reduced with evolution of N₂ (1); \tilde{C} with phenylhydrazine (2 moles) condenses and ring-closes yielding (29) (30) 4-(benzeneazo)-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV₁-(319)], or.-red. ndls. from alc., AcOH, or CHCl₃, m.p. 156-157° (note, however, that in pres. of other the reactn. with phenylhydrazine takes a different course yielding (31) ethyl β -(benzeneazo)-crotonate [Beil. XVI-27], red ndls. from alc., m.p. 50-51°).

[\bar{C} with thioacetamide on warming yields (32) 5-carbethoxy-2,4-dimethylthiazole [Beil. XXVII-318], cryst. from ether, m.p. 50-51° (32). — \bar{C} with NH₄SCN (33) or better Ba-(SCN)₂ (34) in alc. gives (55% yield (34)) 5-carbethoxy-2-hydroxy-4-methylthiazole [Beil. XXVII-338], lfts. from alc., m.p. 128° (33), 127-129° (34); note that this prod. may be regarded as merely the isomeric ethyl α -(thiocyano)acetoacetate (35). — \bar{C} with NH₄dithiocarbamate (from NH₄OH + CS₂) in alc. eliminates NH₄Cl giving an intermediate, m.p. 115-121°, according to mode of htg. (38) but which on fusion ring-closes with loss of aq. to 5-carbethoxy-2-mercapto-4-methylthiazole [Beil. XXVII-339], ndls. from alc., m.p. 150° (38), 141° (39).]

[Č with urea in alc. contg. a little aq. HCl gives on stdg. 5 months (36) 5-carbethoxy-2-hydroxy-4-methylimidazole [Beil. XXV-216], ndls. from aq. or tbls. from alc., m.p. 218° (36). — Č (1 mole) with thiourea (1 mole) at 90° reacts vigorously eliminating H₂O and giving (alm. quant. yield (37)) as the hydrochloride 2-amino-5-carbethoxy-4-methylthiazole [Beil. XXVII-338]; addn. of alk. sets free the base, ndls. from ether/alc., m.p. 175° (37) (13).]

```

[See also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150).]

See Note 1.

C when pure is a colorless liq. which does not fume in moist air and which dissolves in

aq. without opalescence. — Ordinary comml. samples of Č may contain also chloroacetic acid (3:1370) and trichloroacetic acid (3:1150) as well as decompn. products from these or from Č itself, cf. (30) (31).

MISCELLANEOUS PHYSICAL PROPERTIES OF C

Adsorption of \tilde{C} . [For studies of adsorption of \tilde{C} by activated carbon, charcoal, etc., see (32) (33) (34) (35) (36) (39); by silica gel see (33); by cellulose (viscose) see (37); by hide powder see (38).]

Distribution of \tilde{C} between solvents. [For studies and data on distribution of \tilde{C} between aq. + ether at 25° (40) (41); $aq. + C_6H_6$ at 15° (42) (43) (44) (45); aq. + nitrobenzene (43); aq. + toluene (43); aq. + c-nitrotoluene (43) (47); $aq. + CHCl_3$ (3:5050) (43); $aq. + CCl_4$ (3:5100) (43) (46); aq. + EtBr (43) (46); aq. (contg. $MgSO_4$) + di-n-butyl ether (1:7950) (48); aq. + clive oil (49); acetone + glycerol (50) see indic. refs.]

Binary systems contg. \tilde{C} . [For f.p./compn. data on systems \tilde{C} + trichloroacetic acid (3:1150) (25); \tilde{C} + AcOH (1:1010) (25); \tilde{C} + crotonic acid (1:0425) (25); \tilde{C} + benzoic acid (1:0715) (25); \tilde{C} + o-toluic acid (1:0690) (25); \tilde{C} + m-toluic acid (1:0705) (25); \tilde{C} + p-toluic acid (1:0705) (25); \tilde{C} + phenylacetic acid (1:0665) (25); \tilde{C} + cinnamic acid (1:0735) (25); \tilde{C} + 2,6-dimethylpyrone (24); \tilde{C} + azobenzene (19); \tilde{C} + urea (51); \tilde{C} + ethyl carbamate (urethane) (51) see indic. refs.]

PHYSIOLOGICAL BEHAVIOR OF C

[For study of toxicity of C see (52); for action of C on human skin see (53) (54).]

PREPARATION OF C

FROM VARIOUS CHLORO COMPOUNDS

From chloral hydrate. [For prepn. of \bar{C} from chloral hydrate (3:1270) with aq. NaCN + CaCO₃ (yields: 88–92% (55), 90% (15)) or with aq. NaCN (60–65% yield (16)) or with K₃Fe (CN)₆ (63) see indic. refs.; cf. also (56) (57); note here also the closely related matter of conversion of anhydrous chloral (3:5210) with alcohols + KCN (58) to the corresponding alkyl dichloroacetates, e.g., with MeOH to methyl dichloroacetate (3:5655) or with EtOH to ethyl dichloroacetate (3:5850), etc.; also conversion of chloral hydrate (3:1270) in ether with KCN + conc. aq. NH₄OH to (65–78% yield (59)) cf. (58) α,α -dichloroacetamide (see also below).]

From trichloroacetic acid. [For prepn. of \bar{C} from trichloroacetic acid (3:1150) by partial reduction with Zn + aq. (13), with Cu powder in aq. (80% yield (14)) or C_6H_6 + aniline (75-85% yield (8)) cf. (60), or by electrolytic reduction (80% yield (61)) see indic. refs.]

From chloroacetic acid. [For prepn. of \bar{C} from chloroacetic acid (3:1370) with Cl_2 (1), or Cl_2 in pres. of I_2 (62), see indic. refs.]

From dichloroacetaldehyde. [For prepn. of C from dichloroacetaldehyde (3:5180) by oxidn. with HNO₃ see (2).]

From other misc. chloro compounds. [For formn. of \bar{C} from ethyl dichloroacetate (3:5850) with HCl gas (100% yield (11)); from dichloroacetyl chloride (3:5290) by hydrolysis or by disproportionation with AcOH (acetyl chloride (3:7065) also being formed (64)); from β,β,β -trichloro- α -hydroxypropionic acid (trichlorolactic acid) [Beil. III-286, III₁-(111), III₂-(210)] or its ethyl ester with excess aq. Ba(OH)₂ (65); from β,β -dichloro- α -acetoxyacrylonitrile [Beil. III₁-(135), III₂-(254)] with boilg. aq. (66) or from α,β,β -trichloro- α -acetoxypropionitrile [Beil. III-288, III₁-(112)] with 33% H₂SO₄ (66); from 2,2,4,4,6,6-hexachlorocyclohexantrione-1,3,5 (hexachlorophloroglucinol) [Beil. VII-854,

 VII_1 -(469)] with aq. (sym.-tetrachloroacetone (3:6050) is also formed) (67); from unsym.-dichloroacetone (3:5430) by oxidn. with HNO₃ + air (68); from 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with air in ultra-violet light in pres. of water (21) cf. (69); from pentachloroethane (3:5880) by partial hydrolysis with 88-97% $\rm H_2SO_4$ at 168° (90% yield (70)) see indic. refs.]

From miscellaneous non-chlorinated compounds. [For formn. of \tilde{C} from AcOH with Cl₂ (71) in presence of I_2 (62) see indic. refs.; from acetylene with HOCl at 75-80° see (72); from ethyl acetoacetate (1:1710) with aq. bleaching powder (yield 60%) see (73); from phloroglucinol (1:1620) with aq. Cl₂ see (74) (75); from pyrrole with NaOCl see (76).]

CHEMICAL BEHAVIOR OF C

BEHAVIOR AS AN ACID

Acid strength of $\bar{\mathbf{C}}$. $\bar{\mathbf{C}}$ in aq. soln. is a strong acid (ionization const. at 25° is $K=5.14\times 10^{-2}$ (77) cf. (78) (18), at 18° $K=5.15\times 10^{-2}$ (45); for studies of activity coefficient of $\bar{\mathbf{C}}$ in aq. and in salt solns, see (18) (48). — For tests on corrosion of metals by $\bar{\mathbf{C}}$ see (16)].

[Studies of acid strength of \tilde{C} in other solvents include the following: in aq. MeOH (79) (81), in aq. EtOH (79) (80), in abs. EtOH (82), in n-BuOH (5) (83), in C₆H₆ (84), in chlorobenzene (85), in formamide (86), in acetonutrile (87).]

 \bar{C} on titration gives Neut. Eq. = 129.

Salts of C. This topic cannot be exhaustively treated here but following examples are cited.

Salts with inorganic bases. [NH₄ \bar{A} (88); hydroxylamine salt, HONH₃ \bar{A} , cryst. from C₆H₆/EtOH, m.p. 116.0–116.5° (89); Na \bar{A} (on electrolysis gives (90) H₂, CO₂, CO, and also (91) dichloromethyl dichloroacetate; K \bar{A} , lfts. from alc. (11), on dry distn. gives (92) \bar{C} + KCl + CO₂ + carbon; Ca \bar{A} ₂, ndls. from abs. alc. (93); Ca \bar{A} ₂.3H₂O (93); Cu \bar{A} ₂ (88); Cu \bar{A} ₂.4H₂O (88); Cd \bar{A} ₂.H₂O (94); Mn \bar{A} ₂.1½ H₂O (94); Co \bar{A} ₂.3H₂O (94); note that all the foregoing salts are sol. aq.]

[Inorg. salts of \bar{C} which are sparingly sol. aq. include the following: AgA (93); Th(OH)₂ \bar{A}_2 (96); (UO) \bar{A}_2 .2H₂O (97).]

Salts with organic bases (amines). [Aniline dichloroacetate, m.p. 122-123° (8) (98) cf. (30) (159) (note that this prod. or its components at 140° for 24 hrs. gives (98) dichloroacetanilide, m.p. 118°). — o-Toluidine dichloroacetate, m.p. 132.5° (98), 140° (99) (note that this prod. or its components at 140° for 18 hrs. gives (98) dichloroaceto-o-toluidide, m.p. 133°, but depressing m.p. of the salt to as low as 112°). — p-Toluidine dichloroacetate, m.p. 138° (98) (note that this prod. or its components on htg. gives (98) dichloroaceto-p-toluidide, m.p. 154°). — Piperazine bis-(dichloroacetate), m.p. 181° cor. (100). — Semicarbazide dichloroacetate, m.p. 108° (101). — For salts of C with other org. amines see (30) (99).]

Esterification of \tilde{C} . [For this see the text of methyl dichloroacetate (3:5655), ethyl dichloroacetate (3:5850), n-propyl dichloroacetate (3:6000), isopropyl dichloroacetate (3:5890); for study of direct esterification of \tilde{C} with various butyl and amyl alcs. without cat. see (102).]

Conversion of \tilde{C} to corresp. acid chloride. \tilde{C} with PCl₃ (103), with HCl gas + P_2O_5 (104), with SOCl₂ (poor yield apparently due to much forms. of dichloroacetic acid anhydride (3:6430) (105) (106) (107) (108), with BzCl (3:6240) (73% yield (111)), or with benzotrichloride (3:6540) (109) (110) gives dichloroacetyl chloride (3:5290), b.p. 108°.

Addition reactions of \tilde{C} with org. cpds. \tilde{C} in pres. of suitable cat. adds to olefins yielding corresp. esters [e.g., \tilde{C} with propylene + BF₃ as directed gives (39.5% yield (112)) isopropyl dichloroacetate (3:5890); \tilde{C} with 2-methylbutene-2 (trimethylethylene) (1:8220) at 18°

shows slight tendency toward forms. of corresp. ester in C₆H₆, CHCl₃ or CS₂ but none in alc. or ether (113)].

[\bar{C} with ethylene oxide (1:6105) in dry ether at 0° gives (15% yield (114)) cf. (115) β -hydroxythyl dichloroacetate (3:9107).]

BEHAVIOR OF C AS DICHLORO COMPOUND

Reduction. [\tilde{C} in alc. KOH soln. with $H_2 + Pd/CaCO_3$ splits off all its halogen as HCl (116). — \tilde{C} with Zn + water on htg. is slowly reduced to chloroacetic acid (3:1370) but reaction is much less energetic than that of trichloroacetic acid (3:1150) under same conditions (13).]

Hydrolysis of halogen atoms of \bar{C} or its salts. [\bar{C} with aq. in s.t. at 100° is slowly or in pres. of NaOH or Ba(OH)₂ rapidly decomposed (93) cf. (117). — For study of kinetics of hydrolysis of \bar{C} see (118) (119). — Note, however, that Ag \bar{A} on htg. with aq. (93), or \bar{C} (or its salts) on hydrolysis at elevated temp. and press. (120), or salts of \bar{C} htd. with aq. solns. of NaOAc or NaOBz (121), gives glyoxylic acid, OHC—COOH [Beil. III-594, III₁-207, III₂-(385)], m.p. 98°, very sol. aq. — For a method of detn. of \bar{C} in pres. of chloroacetic acid (3:1370) and trichloroacetic acid (3:1350) based on this hydrolysis see (1221.)

Behavior of \tilde{C} with alkoxides. $[\tilde{C} \text{ (as KA)}]$ with excess MeOH/NaOMe refluxed under H₂, and the solution then further esterified with MeOH/HCl, gives (62% yield (123)) cf. (124) methyl dimethoxyacetate, b.p. 60-61° at 12 mm., $D_4^{18} = 1.0962$, $n_D^{18} = 1.4045$ (124); this ester upon alk. hydrolysis gives (85.7% yield (124)) dimethyoxyacetic acid (glyoxylic acid dimethylacetal) as a sirup.]

[C with excess EtOH/NaOEt under reflux followed by acidification and esterification as above gives (50% yield (125)) (126) ethyl diethoxyacetate [Beil. III-601, III₁-(210), III₂-(389)], b.p. 199° (127), 94-98° at 19 mm. (125), 83-85° at 13 mm. (125).]

[Č in excess EtOH/NaOEt with Na phenolate refluxed 14 hrs., then acidified and esterified as above, gives (61% yield (128)) ethyl diphenoxyacetate [Beil. VI-170], oil, b.p. 240° at 53 mm. (129), 166-168° at 0.8 mm. (128). — However, Č with phenol in aq. NaOH on htg. and acidification gives (130) (131) diphenoxyacetic acid, ndls. from pet. ether or aq. AcOH, m.p. 91° (129) (130).]

Condensation with hydrocarbons. \bar{C} with aromatic hydrocarbons on htg. condenses with elimination of 2 HCl giving diarylacetic acids [e.g., \bar{C} with naphthalene at 180° for 60–100 hrs. gives {132} di-(α-naphthyl)acetic acid [Beil. IX-720, IX₁-(313)], cryst. from CCl₄, m.p. 224° (133), 223° u.c. (134); for analogous behavior of \bar{C} with other hydrocarbons see {132}].

Behavior of \tilde{C} with RMgX compounds. [\tilde{C} with C_6H_6MgBr (large excess) in ether soln. followed by usual hydrolysis gives (34% yield (135)) α,α,β -triphenylethylene glycol, ndls. from C_6H_6 , m.p. 163° (135).]

Behavior of \tilde{C} with hydroxylamine. [\tilde{C} (1 mole) with NH₂OH.HCl (1 mole) + aq. KOH (4 moles) at 60° for 4 hrs. gives (136) isonitrosoacetic acid (glyoxylic acid oxime) [Beil. III-599, III₁-(208), III₂-(389)], cryst. from dry ether, m.p. 138° (136) (note that this prod. forms with water a monohydrate, m.p. about 70° (137)).]

Behavior of C with aromatic amines. (See also salt formation above.)

With aniline. The products of reaction of \bar{C} on htg. with aniline are disputed [on one hand \bar{C} (1 mole) with aniline (4 moles) at 100°, then evapd. with NaOAc, is claimed (138) (139) to give 4,4'-diaminodiphenylacetic acid [Beil. XIV-540, XIV₁-(625)], m.p. about 195° (140); on the other hand, the prod. is regarded by some (141) (142) as a mixt. of two stereoisomeric forms of 2,2'(?)-diaminostilbene- α , α '-dicarboxylic acids [Beil. XIV-573]].

With o-toluidine. [C (1 mole) with o-toluidine (4 moles) at 100° gives (140) (143) 4,4′-diamino-3,3′-dimethyldiphenylacetic acid [Beil. XIV-543, XIV₁-(627)], ndls. from alc.,

m.p. 239-240° (143) dec. (140), accompanied by some 7-methylisatin-3-(o-tolylimide) [Beil. XXI-512], yel. lfts. from alc., m.p. about 225° dec. (138).]

With p-toluidine. [Č (1 mole) with p-toluidine (4 moles) at 100° in aq. or alc. soln. gives (144) (145) 5-methylisatin-3-(p-tolylimide) [Beil. XXI-510, XXI₁-(401)], goldenyel. ndls. or lfts. from alc., m.p. 259° (144) (145).]

Behavior of \tilde{C} with urea. \tilde{C} with urea (2 moles) in pres. of NaOEt condenses to give (146) 5-ureidohydantoin (allantoin) [Beil. XXV-474, XXV₁-(692)], m.p. by ord. htg. in cap. tube is 228-230° (147), by rap. htg. in bath already at 228° is 233-234° (147).

Behavior of \bar{C} with arythydrazines. \bar{C} with arythydrazines in alc. KOH yields a mixt. of the two stereoisomeric arythydrazones of glyoxylic acid [e.g., \bar{C} with phenylhydrazone in dil. alc. KOH refluxed 2 hrs. gives (148) a mixt. of the α -glyoxylic acid phenylhydrazone, m.p. abt. 138° with decompn. at 142–143°, and the β -glyoxylic acid phenylhydrazone, m.p. 128–129° dec. (rap. htg.) (148); for analogous behavior of \bar{C} with other arythydrazines see (148)].

- Color test with NH₄OH/Cu₂Cl₂ reagent.
 C on shaking in filled stoppered bottle with conc. aq. NH₄OH contg. Cu₂Cl₂ gives dark blue color within 3 min. (149); note, however, that the same behavior is shown by trichloroacetic acid (3:1150).
- Methyl dichloroacetate: oil, b.p. 143° (see 3:5655).
- --- Ethyl dichloroacetate: oil, b.p. 158° (see 3:5850).
- Benzyl dichloroacetate: oil, b.p. 179° at 60 mm. (150). [From C with benzyl alcohol (1:6480) with HCl gas (150).]
- —— Phenyl dichloroacetate [Beil. VI-153, VI₁-(87)]: m.p. 48° (151), b.p. 247.5° cor. (151). [From dichloroacetyl chloride (3:5290) + AlCl₃ in CS₂ (prod. m.p. 33° was probably impure (152)).]
- ---- p-Tolyl dichloroacetate: m.p. 58° (151). [Prepd. indirectly from α,β-dichlorovinyl ethyl ether (3:5440) with p-cresol (1:1410) (151).]
- --- p-Nitrobenzyl dichloroacetate: oil, unsuitable as (160) (161).
- ---- Phenacyl dichloroacetate: oil (153).
- --- p-Chlorophenacyl dichloroacetate: m.p. 93.0-93.8° (153).
- --- p-Bromophenacyl dichloroacetate: m.p. 98.2-99.3° (153).
- --- p-Iodophenacyl dichloroacetate: unreported.
- --- p-Phenylphenacyl dichloroacetate: unreported.
- © S-Benzylthiuronium dichloroacetate: m.p. 178-179° (154). [Note that for corresp. salts from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) the values are respectively 159-160° and 148-149° (154).]
- S-(p-Chlorobenzyl)thiuronium dichloroacetate: unreported.
- --- S-(p-Bromobenzyl)thiuronium dichloroacetate: unreported.
- α,α-Dichloroacetamide: cryst. from C₆H₆, m.p. 99.4° (155), 98.5-99° (58), 98.5° (156), 97.5-99.5° (59). [From ethyl dichloroacetate (3:5850) with aq. NH₄OH (155) or in other indirect ways, e.g., from chloralammonia with KCN + aq. NH₄OH (93% yield (58)), or from chloral hydrate (3:1270) with KCN + aq. NH₄OH (65-78% yield (59)).] [Note that dichloroacetamide forms with bromo-chloro-acetamide or with chloro-iodo-acetamide an unbroken series of mixed crystals.]
- \bigcirc α,α-Dichloroacetanilide: colorless ndls. from alc. or by sublimation, m.p. 118° (98), 117.7° (156). [From \ddot{C} with aniline at 140° for 24 hrs. (98) or from dichloroacetyl chloride (3:5290) with aniline in C_6H_6 (157) or acetone (157).] [Note that this prod. forms with α-bromo-α-chloroacetanilide, m.p. 116.8° (157), a series of mixed cryst. and with α-chloro-α-iodoacetanilide, m.p. 142.3°, a cutectic, m.p. 105.2° (157).] [Note also that aniline dichloroacetate (see also above) has m.p. 122–123° (98).]

- \bigcirc α, α -Dichloroacet-o-toluidide: cryst. from 50% alc. or by sublimation, m.p. 133° (98). [From \ddot{C} + o-toluidine at 140° for 18 hrs. (98); note that the salt o-toluidine dichloroacetate has same m.p. 132.5° as the α, α -dichloroacet-o-toluidide but that the m.p. of a mixture of the two compds. is depressed to below 112° (98).]
- α,α-Dichloroacet-p-toluidide: pl. from alc. or by sublimation, m.p. 154° (98).
 [From C + p-toluidine at 148° for 18 hrs. (98); note that the corresp. salt, p-toluidine dichloroacetate, has m.p. 138° (98).]
- ---- α,α-Dichloroacet-N-benzylamide: m.p. 96.2° (156), 94.8-95.6° cor. (158), 94.2-95.0° u.c. (158). [From ethyl dichloroacetate (3:5850) (158) cf. (162) or dichloroacetyl chloride (3:5290) (156) with benzylamine; note, however, that the corresp. derivs. from chloroacetic acid (3:1370) and from trichloroacetic acid (3:1150) have almost the same m.p.'s, viz., 93.0-93.6° cor. and 93.6-94.4° cor., respectively (158).]

MISCELLANEOUS PHYSICAL PROPERTIES OF C

BINARY SYSTEMS CONTAINING C

 $\ddot{\mathbf{C}}$ + inorganic compounds. \ddot{C} + $AlCl_3$: m.p. 93° (22), 95° (26); for prepn. from $\ddot{\mathbf{C}}$ + $AlCl_3$ in CS₂ see (26); for thermal anal. (eutectic with $\ddot{\mathbf{C}}$ has m.p. -7.5° and conts. 87.3 wt. % $\ddot{\mathbf{C}}$) see (22); for conductivity of AlCl₃ in $\ddot{\mathbf{C}}$ see (27); for study of mol. wt. in C₆H₆ see (28).

 $\bar{C} + AlBr_3$: m.p. 90° (22); for thermal anal. (eutectic with \bar{C} has m.p. -5° and conts. 77.8 wt. % \bar{C} while eutectic with AlBr₃ has m.p. abt. 7–8° and conts. 21 wt. % \bar{C}) see (22); see also (30).

 $-\bar{C} + FeCl_3$: scarlet red hygroscopic ndls. (31); for conductivity see (28).

 $\ddot{C} + SbCl_3$: for thermal anal. (eutectic with \ddot{C} has m.p. -23° and conts. 55 wt. % \ddot{C}) see (32).

 $\bar{C} + SbCl_5$: for prepn. see (34); for conductivity in liq. SO₂ see (33).

 $\bar{C} + SbBr_3$: for thermal anal. (eutectic with \bar{C} has m.p. -6° and conts. 68 wt. % \bar{C}) see (32).

 $\ddot{\mathbf{C}}$ + organic compounds. \ddot{C} + C_6H_6 : for thermal anal. (eutectic has m.p. -26.8° and conts. 63.6 wt. % $\ddot{\mathbf{C}}$) see (35). — \ddot{C} + p-xylene: for thermal anal. (eutectic has m.p. -18.5° and conts. 67.2 wt. % $\ddot{\mathbf{C}}$) see (35). — \ddot{C} + mesitylene: for thermal anal. (eutectic has m.p. abt. -70° and conts. abt. 20 wt. % $\ddot{\mathbf{C}}$) see (35). — \ddot{C} + biphenyl: for thermal anal. (eutectic has m.p. -8° and conts. 81.8 wt. % $\ddot{\mathbf{C}}$) see (35). — \ddot{C} + diphenylmethane: for thermal anal. (eutectic has m.p. -15° and conts. 66.7 wt. % $\ddot{\mathbf{C}}$) see (35).

 \ddot{C} + chlorobenzene: for thermal anal. (eutectic has m.p. -54.2° and conts. 19.3 wt. % \ddot{C}) see (35). $-\ddot{C}$ + nitrobenzene: for thermal anal. (eutectic has m.p. -20.5° and conts. 50 wt. % \ddot{C}) see (35).

PREPARATION OF C

Note that comml. \bar{C} is often contaminated with various chlorobenzoyl chlorides (e.g., o-chlorobenzoyl chloride (3:6540), m-chlorobenzoyl chloride (3:6550), p-chlorobenzoyl chloride (3:6550), etc.), with traces of benzaldehyde (1:0195), or with benzoic acid (1:0715) + HCl from hydrolysis. For removal of BzOH + HCl from \bar{C} by shaking its C_6H_6 soln. with cold aq. 5% NaHCO₃ see (12); by treatment with metallic oxides or carbonates see (36).

From benzoic acid. [For prepn. of \tilde{C} from benzoic acid (1:0715) with PCl₅ (70% yield (37)) (10) (38), with PCl₃ (39) (40) in pres. of ZnCl₂ (77% yield (37)) or in pres. of a little aq. at 100° under press. (41), with SOCl₂ (90% yield (37)) (42), with SCl₂ in CS₂ (43), with SiCl₄ directly (23% yield (44)) or in C₆H₆ (77% yield (44)), with POCl₃ + alkali chloride at elev. temp. (45), or with dry HCl + P₂O₅ at 200° (46) see indic. refs.]

[For prepn. of \bar{C} from benzoic acid (1:0715) with NaCl + Na or K pyrosulfate at 200° (47), or with Na chlorosulfonate (48) cf. (49), see indic. refs.]

[For prepn. of \bar{C} from benzoic acid (1:0715) with other organic acyl chlorides such as carbonyl chloride (phosgene) (3:5000) at 140-200° (50) or in pres. of tertiary bases (such as pyridine) or their salts (51), with oxalyl (di)chloride (3:5060) (98% yield (15)), with p-toluenesulfonyl chloride in pyridine (52), or with α,β -dichloroethyl ethyl ether (3:5640) (53), see indic. refs.]

From salts of benzoic acid. Note that with salts of benzoic acid more or less forms. of benzoic anhydride (1:0595) may occur.

[For prepn. of \bar{C} from NaOBz with POCl₃ (2) (54), with SCl₂ at room temp. (55) cf. (43), with SO₂ + Cl₂ (56), with Na chlorosulfonate (48) cf. (49), or with benzenesulfonyl chloride (57) see indic. refs.]

[For prepn. of C from AgOBz with carbonyl chloride (3:5000) in s.t. at 100° see (58).]

From dibenzoyl peroxide. [For prepn. of \bar{C} from dibenzoyl peroxide (1:4930) with oxalyl (di)chloride (3:5060) refluxed in dark for 24 hrs. (70% yield (59)), with PCl₅ in pet. ether (60), with AlCl₃ in CHCl₃ at 0° (61) or in C₆H₆ at 100° (62), or with FeCl₃ in C₆H₆ at 100° (62) see indic. refs.]

From other benzoic acid derivatives. [For formn. of \bar{C} from benzamide with dry HCl or AcCl at 140° see (63); from methyl benzoate (1:3586) with PCl₅ at 160-180° (64) or from ethyl benzoate (1:3721) with PCl₅ in s.t. at 140° (65) see indic. refs.; from α,β -dichloroethyl benzoate or from α -chloroethyl benzoate on htg. in pres. of traces of ZnCl₂ see (66); from benzoic anhydride (1:0595) with PCl₃ + Cl₂ (67) or with carbonyl chloride (3:5000) (68) see indic. refs.]

From benzaldehyde. [For formn. of \bar{C} from benzaldehyde (1:0195) with SO₂Cl₂ (5 moles) on distn. (69), with S₂Cl₂ in s.t. at 150° (107), with POCl₃ in C₆H₆ (70), with NOCl (71), with EtOCl (3:7022) (72), with ter-AmOCl (3:9287) (8.5% soln. in CCl₄) at room temp. for 15 hrs. (73), or with Cl₂ (91) (105) (106) see indic. refs.]

From benzotrichloride. [For prepn. of \bar{C} from benzotrichloride (3:6540) by partial hydrolysis with limited amt. of aq. in pres. of H₂SO₄ or FeCl₃ (74), with aq. vapor over tin phosphate at 240° (75), with ord. comml. ZnCl₂ at 120° (76) in pres. of limited aq. (77) (note that pure ZnCl₂ fails to react but addn. of 1 mole aq. or initial use of tech. ZnCl₂ gives \bar{C} (76)), with pure ZnO at 100° (76), with BzOH in boilg. nitrobenzene (78) or in pres. of ZnCl₂ (80), with NH₄OBz at 200–210° as directed (79), or with EtOH in pres. of FeCl₃ or Fe (81) see indic. refs.]

Note that benzotrichloride (3:6540) on heating with carboxylic acids or anhydrides, especially in pres. of ZnCl₂, is often employed to prepare a mixture of \bar{C} with the acid chloride corresponding to the acid or anhydride so employed, particularly in cases where the two acyl chlorides are readily separable. [E.g., note that benzotrichloride (3:6540) with phthalic anhydride (1:0725) (81) (82) or phthalic acid (1:0820) (83) + ZnCl₂ at 110-120° gives (96% yield (82)) \bar{C} + (93% yield (82)) sym.-phthalyl (di)chloride (3:6900); benzotrichloride with AcOH (1:1010) in pres. of an acid cat. gives (84) (85) (86) (87) \bar{C} + acetyl chloride (3:5295), for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5235), fumaryl (di)chloride (3:575), and terephthalyl (di)chloride (3:2205). Similarly, benzotrichloride (3:6540) with salts of sulfonic acids yields \bar{C} + the corresp. arylsulfonyl chlorides; e.g., benzotrichloride with sodium β -naphthalenesulfonate gives (88) 90% yield \bar{C} + 80% yield β -naphthalenesulfonyl chloride.]

From benzal (di)chloride. [For formn. of \tilde{C} from benzal (di)chloride (3:6327) with O_2 in u.v. light (89), with air in pres. of Ni at 160° (90), or with BzOH (1:0715) + Cl_2 at 125-175° (91) see indic. refs.]

From miscellaneous sources. [For formn. of \bar{C} from benzyl alc. (1:6480) with Cl₂ (92) or with SOCl₂ at 180° (103), from benzyl acetate (1:3751) with Cl₂ at 150–170° (104), from thiobenzoyl chloride + O₂ at 100–120° (93), from benzonitrile with NOCl at 180° (94), from tolan (diphenylacetylene) with NOCl at 150–200° (95), from dibenzoyltartaric anhydride + PCl₅ (3 moles) in s.t. at 130° for 3 hrs. (note that chlorofumaryl dichloride is also formed) (96), from N,N-dibenzoylaniline (dibenzanilide) with dry HCl at 250–270° (note that benzanilide is also formed) (97), from α -chloro- α -nitro-phenylacetamide on dry htg. (98), from phthalic anhydride (1:0725) + HCl gas + CrCl₃ or ZnCl₂ at 290–300° under press. (99), or from C₆H₆ (1:7400) with carbonyl chloride (phosgene) (3:5000) + AlCl₃ (100) (101), or with oxalyl (di)chloride (3:5060) + AlCl₃ (102) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis. [\bar{C} in N₂ through porcelain tube at 550-600° (108) or over Ni at 420° (109) cf. (110) gives CO, chlorobenzene (3:7903), and other products; \bar{C} over finely divided Cu at 420-450° gives (110) benzoic anhydride (1:0595) + HCl; \bar{C} over BaCl₂ at 420-450° gives (110) benzoic anhydride (1:0595) and other products. For study of effect of radium radiation at 2-12° over 7-8 month period see (13).]

Reduction. [C with H_2 in boilg. xylene in pres. of PtO_2 + trace of thiourea (111), $Pd/BaSO_4$ (112), or powd. Ni (112), or \tilde{C} over Pd at 200-230° (113) cf. (114) gives (yields: 96% (111), 87-89% (113)) benzaldehyde (1:0195); for study of purification of xylene as solvent for cat. reduction of \tilde{C} see (115); for study of influence of various other solvents see (116) (112).]

[\bar{C} with H_2 in pres. of NiCl₂ at 270-280° gives (110) benzene, toluene, biphenyl + HCl; \bar{C} with copper hydride is claimed (117) to yield benzaldehyde but this could not be confirmed (118). \bar{C} with chromous acetate in 50% KOH gives (very small yield (119)), benzyl alc. (1:6480), while \bar{C} with LiH in high-boilg. pet. ether at 130° gives (presumably by subsequent condensation of the intermediate benzaldehyde) 65% yield (120) benzyl benzoate (1:4422).]

[$\tilde{\mathbf{C}}$ with Na/Hg + stream of dry HCl gives (121) benzyl alc. (1:6480); $\tilde{\mathbf{C}}$ with Na/Hg in dry ether gives (122) (123) (124) benzyl alc. (1:6480), benzoic acid (1:0715), benzil (1:9015), α,α' -dibenzoxystilbene ("isobenzil") [Beil. IX-138], and α,α' -dibenzoxydibenzyl [Beil. IX-136]; $\tilde{\mathbf{C}}$ with Na in moist ether gives (125) benzyl alc. (1:6480), benzoic acid (1:0715), and benzyl benzoate (1:4422).]

Oxidation. [C on oxidn in pres. of hydrocarbon peroxides and various oxidn cat. is claimed (126) to give dibenzoyl peroxide (1:4930); see also below under behavior of C with Na₂O₂.

Chlorination. [\bar{C} on monochlorination with Cl₂ at 35° in pres. of FeCl₃ gives (10) cf. (127) mainly a mixt. of chlorobenzoyl chlorides [83.5% m- (3:6590) + 14.5% o- (3:6640) + 2.0% p- (3:6550)] accompanied by a small amt. of dichlorobenzoyl chlorides; for extensive study of effect of using higher proportion of Cl₂ under otherwise same conditions see (128). Note, however, that \bar{C} with 3 moles Cl₂ in s.t. gives (129) (130) a mixt. of addn. products, such as 1,2,3,4,5,6-hexachlorohexahydrobenzoyl chloride, substitution products, and materials formed by both addition and substitution (130).]

Sulfonation. [C cannot be sulfonated without accompanying hydrolysis of the acyl chloride function (131) (132) (133) (134) (137); the end prod. of these sulfonation processes is, therefore, not m-sulfobenzoyl chloride (apparently still unknown cf. (135)) but rather m-sulfobenzoic acid [Beil. XI-384, XI₁-(98)]. However, C added to conc. H₂SO₄ at 0-40° gives (136) a cryst. addn. prod. C.H₂SO₄ which on stdg. loses HCl forming benzoyl hydrogen sulfate [Beil. IX₁-(94)] but shows no transformation into m-sulfobenzoic acid even after 6 months over dry alkali even though HCl is lost completely (136). At 100° conversion of benzoyl hydrogen sulfate occurred very slowly and the prod. consisted of o-sulfobenzoic acid (not meta) (136).]

BEHAVIOR OF C WITH OTHER INORGANIC REAGENTS

 \bar{C} with HF. [\bar{C} with HF as directed (138) (139) or with dry KHF₂ in Cu retort (140) (141) (142), with ZnF₂ at 195° (11) (143), with AgF in s.t. at 190° for 6 hrs. (144), or with 3 moles SbF₃ (145) gives (yields: 67-80% (140), 76% (145), 69% (11)) benzoyl fluoride, b.p. 161.5° at 745 mm. (142), 159° (139), 156° (146), 155-156° at 760 mm. (11), 155° (138), 154-155° (143), 151° u.c. at 736 mm. (141), 145° (144). Note, however, that \bar{C} with KF in anhydrous formic acid gives (147) formyl fluoride, b.p. 26° at 750 mm. (147), while \bar{C} with KF in AcOH gives (147) acetyl fluoride, b.p. 20-22° (147).]

 $\ddot{\mathbf{C}}$ with HBr. [$\ddot{\mathbf{C}}$ with dry HBr gas at 100° gives (148) benzoyl bromide [Beil. IX-195, IX₁-(95)], b.p. 218-219° cor. at 760 mm. (149), 215.0° at 741 mm. (150), 90-91° at 12 mm. (16), m.p. +8.1° (150), $D_{2}^{40}=1.5461$ (150), $n_{D}^{20}=1.5900$ (150).]

 \bar{C} with HI. [\bar{C} with excess HI at ord. temp. (148) (16), or \bar{C} with Mg + I₂ in dry ether (151), gives benzoyl iodide [Beil. IX-195, IX₁-(95)], b.p. 109-109.5° at 10 mm. (148) cf. (16). Note that \bar{C} with KI does not (152) give benzoyl iodide.]

 \bar{C} with metals. $[\bar{C}$ with Na in dry ether stood 10 days at room temp. gives (86% yield (153)) (154) ethyl benzoate (1:3721) but \bar{C} with Na/Hg in dry ether causes the reaction to take a more complicated course (see above under reduction of \bar{C}). \bar{C} with Na vapor gives (155) cf. (154) benzil (1:9015). \bar{C} with K in xylene refluxed 2 days gives (153) benzoic anhydride (1:0595).]

[For behavior of \bar{C} with Zn in dry ether or in di-isoamyl ether at 20–32° see (156). For behavior of \bar{C} with finely divided Cu or Ni at elevated temps. see above under pyrolysis of \bar{C} .]

C WITH VARIOUS METAL OXIDES OR SALTS

 \bar{C} with Na₂O₂. [\bar{C} with Na₂O₂ in water at 5° (157) cf. (159) or \bar{C} with 30% H₂O₂ + aq. NaOH (158) cf. (159) gives (yields: 91% (157), 60–70% (158)) benzoyl hydrogen peroxide

(perbenzoic acid) [Beil. IX-178, IX₁-(93)], m.p. 42°. For other methods for prepn. of perbenzoic acid such as from dibenzoyl peroxide with NaOCH₃ in MeOH/CHCl₃ (160) or with NaOC₂H₅ in EtOH/toluene (161), or from benzaldehyde in acetone with air (162), see indic. refs. For study of Na perbenzoate (157) and its use in purification (163) of perbenzoic acid see indic. refs.]

[Č with Na₂O₂ in aq. at 0° (164) (165) or in aq. acetone (166), or \tilde{C} with aq. H₂O₂ + NaOH (167) or aq. H₂O₂ + iron-free Ca(OH)₂ (168), or \tilde{C} with aq. BaO₂.8H₂O (169) (170) (171), or \tilde{C} with perbenzoic acid (see preceding paragraph) + aq. NaHCO₃ (172) gives dibenzoyl peroxide [Beil. IX-179, IX₁-(93)], m.p. 105°. For review of prepn. and properties of this prod. see also (173).]

 \bar{C} with misc. salts. \bar{C} on warming with various inorganic salts yields benzoic anhydride. [E.g., \bar{C} with NaNO₂ (174) cf. (175) (176), with KNO₃ (177), with Pb (NO₃)₂ (178), with nitrates of other heavy metals (179), with Na₃PO₄.12H₂O in aq. soln. at 60° (180), with K₂S₂O₅ in pyridine (181), with Na₂SO₃ in pyridine (183) in pres. of C₆H₆ (181) cf. (182), or with BaO at 140–150° (184) gives benzoic anhydride (1:0595), m.p. 42°. For other methods of conversion of \bar{C} to benzoic anhydride see above under pyrolysis of \bar{C} and below under behavior of \bar{C} with organic acids and their salts.]

 $\tilde{\mathbf{C}}$ with NaN₃. [$\tilde{\mathbf{C}}$ with NaN₃ in aq. acetone at 0° (185), or in dry ether (186), gives (54.6% yield (185)) benzoyl azide (benzazide) [Beil. IX-332], m.p. 32° (185). Note that although this prod. readily explodes on htg. (187) (188) yet in inert solvents such as C_6H_6 (194) it smoothly decomposes into N₂ and phenyl isocyanate (for study of mechanism see (189)); under certain circumstances the latter may be hydrolytically split to aniline cf. (190). For studies on decomposition of benzoyl azide by ultrasonic waves see (185) (193).]

Hydrolysis of C

 \bar{C} with cold aq. is slowly and with warm aq. rapidly hydrolyzed (105) to benzoic acid (1:0715) and HCl. [For study of rate of hydrolysis of \bar{C} in ether with aq. at 20-22° (195) or at 0° (148), in 50% aq. acetone at 0° in pres. of H₂SO₄ (196) cf. (198), in various other organic solvents immiscible with aq. (197) or with BaBr₂.2H₂O at 158° (199) see indic. refs.]

 \bar{C} with aq. alkali on warming readily yields (105) alkali benzoate + alkali chloride. Note that \bar{C} in 50% aq. pyridine hydrolyzes much faster than in aq. NaOH or aq. Na₂CO₃ (39) (use in determination of atomic weight of carbon by hydrolysis of \bar{C} and pptn. of AgCl (39)). Note that rate of hydrolysis of \bar{C} is 2000 times as fast (200) as that of benzyl chloride (3:8535).

[Note that \tilde{C} in Ac₂O soln. behaves as an acid (201) and can be titrated (202) with NaOAc in Ac₂O.]

BEHAVIOR OF C WITH VARIOUS INORGANIC SULFUR COMPOUNDS

With H_2S . [The behavior of \bar{C} with H_2S is disputed; on one hand \bar{C} in dry pyridine treated with H_2S at 5° and subsequently acidified is claimed (203) to give thiolbenzoic acid, C_6H_6 .CO.SH [Beil. IX-419, IX₁-(169)] (see next paragraph); on the other hand \bar{C} refluxed in dry pyridine in stream of H_2S is claimed (204) to yield dithiobenzoyl oxide (C_6H_6 .CS)₂O, colorless cryst. from hot alc., m.p. 112°.]

With KSH. [Č with cold alc. KSH (from satn. of alc. KOH with H_2S) gives (205) (206) (207) (209) (8) salt of thiolbenzoic acid, C_0H_5 .CO.SH [Beil. IX-419, IX₁-(169)], m.p. 24° (207) (208), b.p. 98.0–98.6° at 11–12 mm. (8), 61.0–61.3° at 0.05 mm. (8). Note, however, that this product is readily oxidized (dehydrogenated) to dibenzoyl disulfide (see below) by air or mild oxidizing agents, e.g., I₂ (209). \ddot{C} with NaSH (35% aq. soln.) in stream of air followed by H_2O_2 as directed (210) (211), with alc. Na₂S₂ at 5–10° (212), with $K_2S.5H_2O$

in acetone followed by I_2/KI oxidn. (213), or with HSMgBr followed by air oxidn. (208) gives (65-70% yield (210)) dibenzoyl disulfide [Beil. IX-424], cryst. from 1,2-dichloroethane (3:5130) (210) (211) (212), m.p. 128-129° (210) (211) (212); this prod. has considerable pharmaceutical interest as an antipruritic; for hydrolysis to benzoic acid as method of detn. see (210) (214).]

Behavior of C with Various Inorganic Nitrogen Compounds

With NH₃. [C̄ with conc. aq. NH₄OH (215), with dry NH₃ (105), with liq. NH₃ (216), with solid (NH₄)₂CO₃ (217), or with KNH₂ in dry ether (218) gives benzamide [Beil. IX-195, IX₁-(96)], m.p. 130°; note that either the (NH₄)₂CO₃ (219) or KNH₂ (218) methods may give also small amounts of N-benzoylbenzamide (dibenzamide) [Beil. IX-213, IX₁-(104)], m.p. 148°, and/or N,N-dibenzoylbenzamide (tribenzamide) [Beil. IX-214, IX₁-(104)], m.p. 207-208°. However, C̄ with NH₃ gas over Al₂O₃ at 490-500° gives (220) benzonitrile [Beil. IX-275, IX₁-(121)], b.p. 191°, m.p. -13°.]

With NH₂OH. [C in C₆H₆ with free NH₂OH (221), or C in C₆H₆ with NH₂OH.HCl + pyridine (221), or C in ether with NH₂OH.HCl + Na₂CO₃ (221), gives benzohydroxamic acid (N-benzoylhydroxylamine) [Beil. IX-301, IX₁-(128)], cryst. from EtOAc, m.p. 128°. Note that C with aq. NH₂OH solns. (222) also gives side reactions which diminish yield and increase difficulty of purification of prod.; also that C with NH₂OH.HCl in toluene gives (222) benzohydroxamic acid benzoate (dibenzohydroxamic acid) [Beil. IX-303, IX₁-(128)] and other products. For alternative method of prepn. of benzohydroxamic acid from ethyl benzoate (1:3721) with NH₂OH.HCl + MeOH/KOH see (223); for review of utility of hydroxamic acids in org. qual. anal. see (224); for study of formn. of benzohydroxamic acid and its FeCl₃ color reaction as method of detn. of hydroxylamine see (230).]

With NH₂.NH₂. [\ddot{C} (1 mole) with N₂H₄.H₂O (2 moles) in ether gives (225) benzhydrazide (N-benzoylhydrazine) [Beil. IX-319, IX₁-(129)], m.p. 112°, but this prod. is usually better obtd. from reaction of N₂H₄.H₂O with MeOBz (1:3586) (226) or EtOBz (1:3721) (227) (225). \ddot{C} (1 mole) with N₂H₄.H₂SO₄ (0.5 mole) + aq. NaOH (2.3 moles) as directed gives (66-75% yield (228)) N,N'-dibenzoylhydrazine [Beil. IX-324, IX₁-(131)], ndls. from AcOH (228) or EtOH (229), m.p. 237-238° (229).]

BEHAVIOR OF C WITH ORGANIC REACTANTS

BEHAVIOR OF C WITH HYDROCARBONS

With cycloalkanes. [\bar{C} with cyclohexane (1:8405) + AlCl₃ gives (19% yield (231)) phenyl 2-methylcyclopentyl ketone, b.p. 160-162° at 36 mm., $D_4^{18} = 1.0255$, $n_D^{18} = 1.5380$, accompanied by much benzaldehyde (1:0195) presumably formed from \bar{C} by the hydrogen corresp. to coupling of 2 moles of cyclohexane.]

With alkenes. [\bar{C} with ethylene + AlCl₃ in special apparatus as directed gives (87–92% yield (232)) phenyl β -chloroethyl ketone (β -chloropropiophenone) (3:1115); cf. also (233).]

With cycloalkenes. [\bar{C} with cyclohexene (1:8070) + AlCl₃ in CS₂ gives by addition phenyl 2-chlorocyclohexyl ketone (234), which on dehydrochlorination in the pres. of AlCl₃ (234) or with alc. KOH (235) gives (40% yield (235)) phenyl cyclohexenyl ketone (tetrahydrobenzophenone), b.p. 147° at 8 mm., $D_{42}^{22} = 1.070$, $n_{D}^{22} = 1.5595$ (235).]

With alkynes. [For behavior of C with heptyne-1 (1:8085) in pres. of AlCl₃, ZnCl₂, SnCl₄, BF₃, etc., see (236).]

With aromatic hydrocarbons. [\bar{C} with C_6H_6 in pres. of AlCl₃ gives (yields: 74% (237), 71–74% (238)) (240) (241) (242) (243) (244) (245) benzophenone (1:5150), but best (239) prepn. of latter is from $C_6H_6+CCl_4$ (3:5100) + AlCl₃. — For studies of substitution for

AlCl₃ of FeCl₃ (237) (238) (246) (247) (248), FeCl₃ + AlCl₃ (249), GaCl₃ (250), TlCl₃ (251), WCl₆ (252), UCl₄ (252), ZrCl₄ (253), Cr powder (254), ZnCl₂ (238), SbCl₃ (255) (256), or SbBr₃ (257) see indic. refs. — \bar{C} with C₆H₆ in liq. HCl at 200° and 250 pounds press. (258) or in pres. of P₂O₅ in s.t. at 180-200° (259) (260) gives small yield of benzophenone (1:5150). — \bar{C} with C₆D₆ + AlCl₃ in CS₂ gives (261) phenyl pentadeuterophenyl ketone, b.p. 160° at 15 mm. (corresp. oxime, m.p. 140°, does *not* depress m.p. of ordinary benzophenone oxime).]

[C with toluene in pres. of AlCl₃ gives (262) (263) (264) mainly phenyl p-tolyl ketone (1:5160) together with some phenyl o-tolyl ketone [Beil. VII-439, VII₁-(234)]. For studies of substitution for AlCl₃ of FeCl₃ (263), FeCl₃ + AlCl₃ (265), or SbCl₃ (255) (256) see indic. refs.]

[For reaction of C in pres. of AlCl₃ with o-xylene (1:7430) (262), m-xylene (1:7420) (262) (266) (267), p-xylene (1:7415) (262), ethylbenzene (268) (266) (269), see indic. refs.] [Č with biphenyl (1:7175) in pres. of AlCl₃ gives (yields: 75% (270), 60% (271)) (272) (273) (274) (275) (276) (242) phenyl p-xenyl ketone (p-phenylbenzophenone) [Beil. VII-521, VII₁-(290)], scales from alc., m.p. 106° cor. (270), 106° (272) (273), 102-103° (275), 102° (271), 101-102° (242), 101° (276); b.p. 413° at 758 mm. (271), 419-420° at 744 mm. (274), 258° at 10 mm. (276) (corresp. oxime exists in two stereoisomeric forms (277), m.p. 200° and 173°, usual mixt. having m.p. 193-194° (278), 186-187° (271); corresp. 2,4-dinitrophenylhydrazone, m.p. 217-217.5° (271); for use of P₂O₅ (instead of AlCl₃) in prepn. of p-phenylbenzophenone (above) see (279). Note that the isomeric o-phenylbenzophenone, m.p. 86-87°, has been prepared indirectly (280)]

[\bar{C} with naphthalene (1:7200) in pres. of AlCl₃ in CS₂ (281) (282) (283) (284) (285) (286) or without solvent at 150° (286), or in liq. SO₂ (287), or \bar{C} with naphthalene in pres. of ZnCl₂ at 125° (286) cf. (288) (289) or of P₂O₅ (289) (279) (259) (260), gives (yields: 85% (282), 52% (287)) mainly phenyl α -naphthyl ketone (1-benzoylnaphthalene) [Beil. VII-510, VII₁-(283)], pr. from alc., m.p. 75.5-76° (276), 75.5° (282), 75-76° (281), 75° (283), b.p. 386° at 764 mm. (284), 222° at 8 mm. (276); note that this prod. is usually accompanied by some phenyl β -naphthyl ketone (2-benzoylnaphthalene) [Beil. VII-511, VII₁-(283)], ndls. from alc., m.p. 82° (276) (289), 81-83° (281), b.p. 398° at 754 mm. (284), 225° at 8 mm. (276).]

[For reaction of \tilde{C} with anthracene (1:7285) + AlCl₃ in CS₂ (277) (290) (291) (292) (293), or in nitrobenzene at -10° (294), or without AlCl₃ in boiling nitrobenzene (295) giving (yields: 85% (277), 78% (290)) 9-benzoylanthracene (α -anthraphenone) [Beil. VII-538], cryst. from EtOAc, m.p. 145.5-146° (277), see indic. refs.; note, however, that for prepn. of this prod. use of benzoic anhydride (1:0595) (rather than \tilde{C}) is preferred (296). — For reaction of \tilde{C} with phenanthrene (1:7240) + AlCl₃ in CS₂ (297) (298) or in nitrobenzene (298) see indic. refs.]

With heterocyclic parent nuclei. The behavior of \tilde{C} with furan (1:8015) in the pres. of Friedel-Crafts cat. has apparently not been reported [however, the prod. to be expected, viz., phenyl α -furyl ketone [Beil. XVII-348, XVII₁-(186)], b.p. 285° at 759 mm. (299), 186° at 46 mm. (299), 164° at 19 mm. (299), $D_{-}^{20} = 1.1732$ (300), $D_{10}^{19} = 1.1839$ (299), $D_{-}^{20} = 1.6055$ (299), 1.5798 (300), has been obtd. (49% yield (301)) from benzoic anhydride (1:0595) with furan (1:8015) + SnCl₄ in C₆H₆, and from furoyl chloride (3:8515) with C₆H₆ in pres. of AlCl₃ (299).]

[Č with thiophene in pres. of AlCl₃ (302), SnCl₄ (303) (304), P_2O_5 (305), or α -thienyl-mercuric chloride (306) cf. (307) (308) gives (yields: 89-90% (302), 82.5% (304)) phenyl α -thienyl ketone [Beil. XVII-348, XVII₁-(187)], m.p. 56° (305) (307), 55.5-56° (306), 55-56° (302), 55° (303) (304).]

BEHAVIOR OF C WITH ORGANIC HYDROXYL COMPOUNDS

Č with organic OH or SH compounds (or their metallic salts) gives in general the corresponding benzoates. With phenols, however, there is also the additional possibility (according to the conditions employed) of either direct nuclear benzoylation or Fries rearrangement of the benzoate esters to give phenolic ketones.

Esterification of alcohols or phenols with \bar{C} in presence of aqueous alkali comprises a general procedure first discovered by Lossen (309) and later developed and extended by Schotten, Baumann, and others. The reaction is not restricted to the use of benzoyl chloride but covers acid haldes in general, e.g., acetyl chloride, p-nitrobenzoyl chloride, 3,5-dinitrobenzoyl chloride, benzenesulfonyl chloride, etc.

For detailed quantitative study of the influence of conditions on the Schotten-Baumann reaction see (310); for study of its application to p-nitrobenzoyl chloride (311) or of 3,5-dinitrobenzoyl chloride (312) in the derivatization of alcohols in dilute aqueous solution see indic. refs.; for study of substitution of the acyl halide by the corresponding anhydride see (313).

Note that in general the yield of ester is improved by use of low temperature (0°-25°) (310), by use of relatively concentrated solutions of both the hydroxyl compound and the alkali (310), and sometimes by additions of NaOAc or other salts. (311).

With monohydric alcohols. C with monohydric alcs. gives the corresponding alkyl benzoates.

[E.g., \bar{C} with MeOH (1:6120) gives methyl benzoate (1:3586), b.p. 199.6°, m.p. -12.5° (for study of rate of reaction at 0° and 25° see (18)). $-\bar{C}$ with EtOH (1:6130) gives ethyl benzoate (1:3721), b.p. 213.2°, m.p. -34.2° (for study of rate of esterification at 0° (17) or at 25° in various solvents (314) see indic. refs. $-\bar{C}$ with n-PrOH (1:6150) gives n-propyl benzoate (3:3917), b.p. 231°. $-\bar{C}$ with isopropyl alc. (1:6135) gives isopropyl benzoate (1:3766), b.p. 218.5° (for study of rate of esterification at 25° (6) or at 30° (11) (315) see indic. refs.).

[Č with n-BuOH (1:6180) gives n-butyl benzoate (1:4104), b.p. 250.3°, m.p. -22.4° . — Č with isobutyl alc. (1:6165) gives isobutyl benzoate (1:4006), b.p. 242.2° cor. — Č with sec-BuOH (1:6155) gives (yields: 75% (316), 66% (317), 20% (318)) sec-butyl benzoate [Beil. IX-112, IX₁-(63)], b.p. 234.5–235.5° cor. at 757 mm. (317), 148–151° at 50 mm. (317), 115–117° at 20° (319), 112–116° at 14 mm. (318), $D_4^{25} = 0.9945$ (°17), $D_1^{21.3} = 1.4933$ (319). — Č with ter-BuOH (1:6140) in pres. of pyridine gives (yields. 86% (320), 80% (321) (322)) ter-butyl benzoate [Beil. IX₁-(64)], b.p. 112° at 18 mm. (321), 91–92° at 8 mm. (323), 91.3° at 7.5 mm. (320), 96° at 2 mm. (322); $D_4^{25} = 0.9928$ (322); $D_2^{25} = 1.4896$ (322) (321), $D_2^{25} = 1.4910$ (320).]

[$\tilde{\mathbf{C}}$ with n-AmOH (1:6205) gives n-amyl benzoate [Beil. IX₁-(64)], b.p. 138-139° at 15 mm. (316), 137-138° at 15 mm. (324). — $\tilde{\mathbf{C}}$ with isoamyl alc. (1:6200) gives isoamyl benzoate (1·4166), b.p. 262.3° cor. at 760 mm. — $\tilde{\mathbf{C}}$ with neopentyl alc. (1:5812) gives (325) neopentyl benzoate, b.p. 235-237° at 740 mm., 110-111° at 10 mm., $D_{25}^{25} = 0.9817$, $n_{D}^{25} = 1.4875$ (325).]

C reacts with other alcohols and thiols similarly, but details cannot be tabulated here.

With phenols. \bar{C} can react with phenols in either or both of two modes; on one hand it can benzoylate the phenolic OH yielding the corresponding phenol benzoates (a list of the melting points of 88 phenols of Order 1 is given on page 638 of Vol. I of this series (326); for study of effect of structure on rate of benzoylation of various monohydric phenols see (329)); on the other hand \bar{C} may under certain conditions effect the direct nuclear benzoylation of phenols. Since the phenolic ketones thus formed may also be more or less readily obtained by catalyzed rearrangement of the phenol benzoates, the chemistry of the phenol

benzoates and their rearrangement products is so voluminous that it cannot here be given detailed discussion. [For extensive reviews of the Fries rearrangement (327) (328) of phenol esters (including the benzoates) see indic. refs.]

With enols (or their metallic derivatives). With methyl acetoacetate. [\bar{C} with the Na enolate of methyl acetoacetate (1:1705) gives (330) methyl α -benzoylacetoacetate, b.p. 136-137° at 2 mm. (corresp. Cu enolate, blue-green ndls. from dioxane, m.p. 226-228°; corresp. semicarbazone, prepd. by indirect means, m.p. 166° (331)).]

With ethyl acetoacetate. [\bar{C} with the Na enolate of ethyl acetoacetate (1:1710) gives (yields: 74.8% (332), 67% (333), 63–75% (334) cf. (335) (337) ethyl α -benzoylacetoacetate [Beil. X-817, X₁-(396)], b.p. 202° at 50 mm. (335), 177–181° at 20 mm. (334), 175–176° sl. dec. at 12 mm. (337), 169° sl. dec. at 11 mm. (338), 165–167° at 10 mm. (333) (corresp. Cu enolate, m.p. 224° (336), 221–222° (339)). Note that this prod. upon cleavage of the acetyl group, e.g., with aq. NH₄OH + NH₄Cl, gives (77–78% yield (334)) (332) ethyl benzoylacetate (1:1778), for alternative prepn. of which see (340). — Note, however, that two forms of the isomeric ethyl O-benzoylacetoacetate are known (341); a liq. form, b.p. 153–155° at 3 mm., prepd. from ethyl acetoacetate (1:1710) with \bar{C} + pyridine, and a solid form, m.p. 42°, prepd. from the Cu enolate of ethyl acetoacetate (1:1710) with \bar{C} in ether (for much further detail see (341)).]

With acetylacetone. [C with the Na enolate (342) or K enolate (343) of acetylacetone (1:1700) in ether gives (50% yield (343)) C-benzoylacetylacetone (α -benzoyl- α -acetylacetone) [Beil. VII-865, VII₁-(474)], m.p. 35° (342), 34-35° (343), b p. 167° at 22 mm. (342), accompanied by some of the higher-melting form, m.p. 103° (342), 102-103° (343), of its benzoate [Beil. IX-156]; note that the lower-melting form, m.p. 66-67° (344), is obtd from α -benzoyl- α -acetylacetone (above) with \bar{C} in pyridine (344).]

With benzoylacetone. [Č with Na enolate of benzoylacetone (1:1450) under various conditions gives (345) (346) (347) cf. (348) α,α -dibenzoylacetone [Beil. VII-872, VII₁-(480)] (q.v. for constants of various enol and keto forms) and/or the corresp. benzoate [Beil. IX-157], m.p. 87-88° (349).]

With dibenzoylmethane. [C with Na enolate of dibenzoylmethane (1:1480) gives (45% yield (350)) (351) (352) (353) tribenzoylmethane [Beil. VII-877, VII₁-(485)] (q.v. for constants of various forms) and/or the corresp. benzoate [Beil. IX-158], m.p. 121-122° (351).]

BEHAVIOR OF C WITH ETHERS

With aliphatic ethers. Acyl chlorides with aliphatic ethers do not react even at elevated temperatures (354) although acid bromides (e.g., acetyl bromide (355)) or acyl iodides (e.g., benzoyl iodide (356)) are able to effect cleavage into alkyl halides and alkyl esters. However, when acyl chlorides are heated with aliphatic ethers in the presence of certain metallic salts, cleavage of the ethers is more or less readily effected. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

[Č with diethyl ether (1:6110) on htg. in pres. of ZnCl₂ (354) (357) (358) (359) (360), SnCl₄ (358), ZrCl₄ (358), TiCl₄ (358) (362), SbCl₅ (358), FeCl₃ (358) (361), AlCl₃ (358) (362), or SbCl₅ (358) gives ethyl benzoate (1:3721); note, however, that use of BF₃, CuCl₂, and SnCl₂ gives only traces while SiCl₄, PCl₅, PCl₅, BCl₃, AsCl₃, or MgCl₂ achieves no cleavage (358) of the ether. Note that by extension of the ZnCl₂ method to use of 3,5-dinitrobenzoyl chloride a procedure for the identif. of ethers as the corresp. alkyl 3,5-dinitrobenzoates has been described (363) cf. (364).]

With phenol ethers. With phenol ethers where no phenolic OH remains to interfere, C reacts in the pres. of suitable cat. in the Friedel-Crafts sense. Although the topic cannot here be pursued exhaustively, several examples are cited in the following text.

[\bar{C} with methyl phenyl ether (anisole) (1:7445) + AlCl₃ in CS₂ solution (81% yield (365)) (366) (367) cf. (368) (360) or without other solvent (369) gives mainly p-anisyl phenyl ketone (p-methoxybenzophenone) (1:5170), m.p. 62° (366) (367) (370), 61-62° (365) (369), 61° (371), b.p. 354-355° at 729 mm. (371); this prod. is accompanied by some o-anisyl phenyl ketone (o-methoxybenzophenone) (1:5142), m.p. 39°, which is separable from the main prod. only by repeated recrystallization from lgr. (b.p. 40-60°) and alc. (369).]

[\bar{C} with ethyl phenyl ether (phenetole) (1:7485) + AlCl₃ in CS₂ soln. (yields: 83% (372), 73% (374)) (369) (366) (373) or without other solvent (369) gives mainly p-phenetyl phenyl ketone (p-ethoxybenzophenone) [Beil. VIII-159, VIII₁-(569)], m.p. 47-48° (374), 47° (369) (372), 46.5° (373), 38-39° (366), b.p. 245-250° at 25 mm. (374), 227° at 21 mm. (373), 215-225° at 15 mm. (373) (corresp. oxime, m.p. 135-136° (374)), accompanied by some o-phenetyl phenyl ketone (o-ethoxybenzophenone) which (although not further characterized) is liq. and readily separable.]

[\bar{C} with diphenyl ether (1:7125) + AlCl₃ in CS₂ (375) (376) (374), or \bar{C} with diphenyl ether (1:7125) + HgCl₂ at 150–160° (377) (27% yield), or \bar{C} with phenyl 4-chloromercuriphenyl ether at 150° (377), gives (yields: 97% (375), 95% (374), 70% (377)) p-phenoxy-benzophenone [Beil. VIII-159], m.p. 71° cor. (375), 70–71° (374), 66° (377) (corresp. oxime, m.p. 124° (374)); for further benzoylation of this prod. to bis-(p-benzoylphenyl) ether, m.p. 163–164°, see (376).]

[Č with methyl α -naphthyl ether (1:7630) + AlCl₃ in CS₂ (378) or in nitrobenzene (379) gives (84% yield (379)) 4-benzoyl-1-methoxynaphthalene, m.p. 82–83° (378), 81–82° (379); for high-press. hydrogenation of this prod. giving (84–86% yield) 4-benzyl-1-methoxynaphthalene, m.p. 83–84°, see (379). — Č with methyl β -naphthyl ether (1:7180) + AlCl₃ in CS₂ gives (85% yield (380)) 1-benzoyl-2-methoxynaphthalene, m.p. 125° cor.; not that use of 1,1,2,2-tetrachloroethane as solvent is much less satisfactory (381). — Č with ethyl α -naphthyl ether (1:7635) + AlCl₃ in CS₂ gives (366) (382) 4-benzoyl-1-ethoxynaphthalene [Beil. VIII-207, VIII₁-(586)], m.p. 74–75° (366), accompanied (383) by some 4-benzoylnaphthol-1 and other products. — The presumably analogous reaction of Č with ethyl β -naphthyl ether (1:7135) + AlCl₃ appears not to have been studied, and the expected 1-benzoyl-2-ethoxynaphthalene is unreported.]

Behavior of \bar{C} with Acids (or Their Salts)

With sodium formate. [C with NaOOCH on htg. (384) gives BzOH (1:0715), CO, + HCl.]

With acetic acid. [\bar{C} with AcOH (1:1010) refluxed in pres. of charcoal (385), or in pres. of a tertiary base (386) even at ord. temp., or \bar{C} with NaOAc on warming (387) cf. (388) (389) gives the mixed anhydride, CH₃.CO.O.CO.C₆H₅ [Beil. IX-163], accompanied by various other products. Note, however, that \bar{C} with AcOH (1:1010) at 100° for 3 hrs. gives (70% yield (147)) acetyl chloride (3:7065) while \bar{C} with Ac₂O (1:1015) at 100° for 1 hr. gives (77% yield (147)) acetyl chloride (3:7065) accompanied by benzoic anhydride (1:0595). For prepn. of acetic-benzoic anhydride by other means, e.g., from benzoic acid (1:0715) with ketene (390), and for study of its use in Friedel-Crafts type reactions (391), see indic. refs.]

With benzoic acid. [C with benzoic acid (1:0715) in s.t. at 160-200° for 12 hrs. (392), or at 220° under reduced press. (397), or with pyridine (389) (393), or C with NaOBz shaken with aq. (394) or htd. at 130° (395), gives benzoic anhydride (1:0595), m.p. 42°, b.p. 360°; for other modes of formn. of this prod. from C see above under behavior of C with various inorganic salts; for prepn. (72-74% yield) of benzoic anhydride (1:0595) from benzoic acid (1:0715) by use of acetic anhydride (1:1015) see (396).]

With HCN. [Č with dry HCN in pyridine + ether (398) (399) cf. (406), or Č with HgCN (400) (401) (403) (404), AgCN (402), or CuCN (12), gives (yields: 78% (399), 60-65% (12)) benzoyl cyanide (phenylglyoxylic acid nitrile) [Beil. X-659, X₁-(314)], m.p. 34° (401), 32.5-34° (403), 32-33° (12), b.p. 208-209° at 745 mm. (12), 207-210° (402), 206-208° (404), 123° at 42 mm. (401), 99° at 19 mm. (405). Note that by the HCN/pyridine method (398) (399) (406) or by reaction of Č with aq. KCN (402) dimeric benzoyl cyanide [Beil. XIX-362], m.p. 99-100° (402), 95-96° (406), is also formed; further that benzoyl bromide with AgCN gives (402) a trimeric benzoyl cyanide, m.p. 195°.]

With cyanate or thiocyanate salts. [\bar{C} with K cyanate (407), KSCN (408), or NH₄SCN (409) gives benzonitrile [Beil. IX-275, IX₁-(121)], \bar{B} .p. 191.3° at 760 mm., but \bar{C} with Pb(SCN)₂ at 160° (410), at 120° (413), or refluxed in C₆H₆ (411) (412) gives benzoyl isothiocyanate [Beil. IX-222, IX₁-107], b.p. 119° at 10 mm. (412), $D_4^{18.3} = 1.2142$ (412), $n_B^{18.5} = 1.6382$ (412).]

BEHAVIOR OF C WITH ORGANIC NITROGEN COMPOUNDS

Č reacts with primary and secondary amines to replace one of the amino hydrogen atoms by the benzoyl radical. The molecule of HCl thus split out will, of course, convert a second molecule of amine to its hydrochloride. In order to avoid this waste of amine, the benzoylation may be effected in the presence of aqueous alkali (Schotten-Baumann reaction) or of pyridine (Einhorn reaction). Since the number of amino compounds which undergoes benzoylation is legion, the present text will be restricted to a relatively few important cases.

With aliphatic primary amines. [C with aq. CH₃NH₂ (414) in pres. of alk. (415) gives N-methylbenzamide [Beil. IX-201, IX₁-(97)], cryst. from alc. (416), aq. (417), or $\lg r./C_6H_6$ (418), m.p. 82° (416), 80-81° (418) (419), 79.8° (417), 79° (414), 78° (415), b.p. 291° at 765 mm. (419), 167° at 11 mm. (420). — \bar{C} with aq. $C_2H_5NH_2$ (414) gives N-ethylbenzamide [Beil. IX-202, IX₁-(97)], ndls. from aq., m.p. 71° (419), 70° (421), 69° (417), 68-69° (414), 67° (420), b.p. 285° at 745 mm. (419). — \bar{C} with $n-C_3H_7NH_2$ presumably yields $N-(n-C_3H_7NH_2)$ propyl)benzamide [Beil. IX-203, IX₁-(97)], cryst. from alc. or C₆H₆, m.p. 84.5° (419), 83° (422), b.p. 294-295° sl. dec. (422), but this product has been reported only by other methods (419) (422). — \bar{C} with $n-C_4H_9NH_2$ presumably gives N-(n-buty) benzamide but this product has been characterized only as an oil cf. (423). — C with isobutylamine + aq. NaOH (416) cf. (424) gives N-(isobutyl) benzamide [Beil. IX-203, IX₁-(97)], ndls. from C_6H_6 , CHCl₃, alc., or lgr.), m.p. 57-58° (416), 57° (419), 55° (424), 54° (422), b.p. 295-296° sl. dec. at 760 mm. (419), 173-178° at 13 mm. (416). — C with sec-C₄H₉NH₂ should give N-(secbutyl)benzamide but the d,l-form of this product is unreported; note that its dextrorotatory form has been reported as m.p. 92° (425) or 86-88° (426); the levorotatory form as m.p. 88-89° (425). — \bar{C} with $ter-C_4H_9NH_2$ in other (427) (428) gives N-(ter-butyl) benzamide [Beil. IX₁-(97)], ndls. from ether/ C_6H_6 , m.p. 136.5° (428), 135.5° (427), 134-135° (429), 134° (430). Note that dibenzoylation does not occur and that N-methyldibenzamide [Beil. IX₁-(104), m.p. 94-95° (435), and N-ethyldibenzamide [Beil. IX-214], m.p. 101-102° (436), have been prepared only by indirect means.

With aliphatic secondary amines. [\bar{C} with $(CH_3)_2NH$ in ether (431), in aq. (414), or in aq. NaOH (405) gives N,N-dimethylbenzamide [Beil. IX-201, IX₁-(97)], cryst. from CS₂/pet. ether (405), m.p. 43° (405), 41-42° (431), 41° (414), b.p. 272-273° (420), 265-266° (432), 132-133° at 15 mm. (432). — \bar{C} with $(C_2H_5)_2NH$ in ether (431) gives N,N-diethylbenzamide [Beil. IX-202], liquid, b.p. 280-282° cor. (431), 278-282° (433), 173-175° at 35 mm. (434). — Note that the analogous N,N-dialkylbenzamides to be expected from reaction of \bar{C} with di-n-propylamine, di-isopropylamine, di-n-butylamine, di-isobutylamine, di-sec-butylamine, and di-n-butylamine have not been characterized.]

With aromatic primary amines. See below under @'s.

With aromatic secondary amines. \bar{C} with aromatic secondary amines gives the corresponding N-benzoyl derivatives but note that these same products are frequently also obtained by reaction of \bar{C} with the appropriate tertiary amines.

[Č with N-methylaniline (437), or Č with N,N-dimethylaniline at 190° (438), gives N-benzoyl-N-methylaniline (N-methylbenzanilide) [Beil. XII-269], scales from lgr., m.p. 63° (438), 59° (437), b.p. 331-332° (439). — Č with N-ethylaniline (not actually reported) or Č with N,N-diethylaniline at 200° (438) gives N-benzoyl-N-ethylaniline (N-ethylbenzanilide) [Beil. XII-270], cryst. from ether + lgr., m.p. 54° (440), 52° (441), 60° (438).]

[\bar{C} with N-methyl-o-toluidine should yield N-benzoyl-N-methyl-o-toluidine (N-methyl-benzo-o-toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 65-66°, and \bar{C} with N-ethyl-o-toluidine should yield N-benzoyl-N-ethyl-o-toluidine (N-ethyl-benzo-o-toluidide) [Beil. XII-796], pr. from ether/lgr., m.p. 71-72°, but both these products have been reported only by indirect means (442). — The analogous products to be expected from \bar{C} with N-methyl (or N-ethyl)-m-toluidine, or \bar{C} with N-methyl (or N-ethyl)-p-toluidine, have not been characterized in the literature.]

[$\bar{\mathbf{C}}$ with N-methyl-α-naphthylamine should yield N-benzoyl-N-methyl-α-naphthylamine [Beil. XII-1234], cryst. from $\mathbf{C_6H_6/lgr.}$, m.p. 121°, but this prod. has actually been reported only from $\bar{\mathbf{C}}$ with N,N-dimethyl-α-naphthylamine at 170–190° (438). — Similarly, $\bar{\mathbf{C}}$ with N-methyl-β-naphthylamine + aq. alk. yields (443) N-benzoyl-N-methyl-β-naphthylamine [Beil. XII-1287, XII₁-(539)], ndls. from pet. eth., m.p. 84° (443); this prod. is also claimed (438) from N,N-dimethyl-β-naphthylamine at 170–180° but the m.p. of 169° is not in accord with the later work under mild conditions and presumably represents an isomeric material. — The analogous benzoyl derivatives of N-ethyl-α-naphthylamine and of N-ethyl-β-naphthylamine are unreported.]

[C with diphenylamine on warming (444) in ether soln. (445) gives N-benzoyldiphenylamine (N,N-diphenylbenzamide) [Beil. XII-270, XII₁-(201)], cryst. from alc., m.p. 180° (435), 179-180° (446), 177° (447).]

 $\bar{\mathbf{C}}$ with heterocyclic secondary amines. $\bar{\mathbf{C}}$ with piperidine [Beil. XX-6, XX₁-(5)] directly (536) or better in aq. NaOH (537) (538) (539) gives (87-91% yield (537)) N-benzoyl-piperidine [Beil. XX-46, XX₁-(15)], m.p. 49° (540), 48° (538), 44° (537); b.p. 320-321° (541), 240-244° at 130 mm. (537), 195° at 25 mm. (541), 180-184° at 20 mm. (537), 172-174° at 12 mm. (537); not volatile with steam (538). [Note that this prod. with PBr₅ (542) (543) (544) (545) (546), with PBr₃ + Br₂ (547), or with PCl₃ + Br₂ (548) comprises an important method of preparation of pentamethylene dibromide (1,5-dibromopentane).]

Č with morpholine [Beil. XXVII-5] in ether gives (549) N-benzoylmorpholine, eas. sol. aq., pr. from dry ether, m.p. 74-75° (549).

Č with aromatic diamines. [Č with o-phenylenediamine [Beil. XIII-6, XIII₁-(5)] in aq. NaOH (448), or Č with o-phenylenediamine hydrochloride in aq. soln. (449), gives N,N'-dibenzoyl-o-phenylenediamine [Beil. XIII-21, XIII₁-(8)], ndls. from AcOH, m.p. 301° (450), about 300° dec. (451). — Note that this prod. on htg. above m.p. (450), or on htg. with conc. HCl in s.t. at 200° (449), gives 2-phenylbenzimidazole [Beil. XXIII-230, XXIII₁-(61)], m.p. variously reported around 290°, which latter, although stable toward Č at 260° (452), yet with Č + aq. NaOH in cold (450) reverts to N,N'-dibenzoyl-o-phenylenediamine (above). — Note that N-benzoyl-o-phenylenediamine [Beil. XIII-20, XIII₁-(8)], m.p. 140° (453), has been reported only by indirect means (453) (454); on htg. 2 hrs. at 140° followed by a few minutes at 280° (455) it gives 2-phenylbenzimidazole (see above). — Note finally that 1-benzoylbenzimidazole [Beil. XXIII-133, XXIII₁-(35)], m.p. 93-94° (456), 91-92° (450), on htg. with Č (457), or benzimidazole itself with Č + aq. NaOH (450), both give N,N'-dibenzoyl-o-phenylenediamine (above).]

[C with hydrochloride of m-phenylenediamine [Beil. XIII-33, XIII₁-(10)] on htg. gives

(458) N, N'-dibenzoyl-m-phenylenediamine [Beil. XIII-46], ndls. from AcOH, m.p. 240° (458) (460); for behavior of this prod. with PCl₅ see (459). — Note that N-benzoyl-m-phenylenediamine (benz-m-aminoanilide) [Beil. XIII-46], m.p. 125°, has been reported only by indirect means (461) (462) (464).]

[Č with p-phenylenediamine [Beil. XIII-61, XIII₁-(18)] + aq. NaOH (448) cf. (463) gives N,N'-dibenzoyl-p-phenylenediamine [Beil. XIII-98], m.p. above 300° (448) cf. (460); for behavior of this prod. with PCl₅ see (459). — Note that N-benzoyl-p-phenylenediamine (benz-p-aminoanilide) [Beil. XIII-98, XIII₁-(31)], m.p. 128° (452) (464), has been reported only by indirect means (452) (464).]

Č with aminophenols. Č with o-aminophenol [Beil. XIII-354, XIII₁-(108)] gives according to circumstances one of the two possible monobenzoyl derivatives, viz., o-(benzoylamino)phenol [Beil. XIII-372, XIII₁-(115)] (or its ring-closure product, 2-phenylbenzoxazole-1,3 [Beil. XXVII-72, XXVII₁-(235)]), or the dibenzoyl derivative, viz., o-benzoylaminophenyl benzoate [Beil. XIII-373], as more fully described below. Note, however, that the other monobenzoyl derivative of o-aminophenol, viz., O-benzoyl-o-aminophenol or o-aminophenyl benzoate, known only as its hydrochloride, m.p. 149° (465), has been prepared only by indirect means (465) viz., from O,N-(dibenzoyl)-o-aminophenol, and on heating, or even on recrystn., loses HCl giving (465) 2-phenylbenzoxazole-1,3.

[$\bar{\mathbb{C}}$ (1 mole) with o-aminophenol (2 moles) in dry ether (466) gives o-(benzoylamino)-phenol (N-benzoyl-o-aminophenol), tbls. from MeOH (465), lfts. from $\mathbb{C}_6\mathbb{H}_6$, m.p. 169–171° u.c. (465), 169° (467), 167° (468) (corresp. acetate, m.p. abt. 140° (469) cf. (470); corresp. benzoate, m.p. 182° (470) (also below); corresp. benzenesulfonate, m.p. 90.5–91.0 (471)). — Note that this prod. on htg. above m.p. loses $\mathbb{H}_2\mathbb{O}$ with ring closure yielding (468) 2-phenyl-benzoxazole-1,3, m.p. 103° (see below). — Note also that o-(benzoylamino)phenyl benzoate (above) with $\bar{\mathbb{C}}$ in nitrobenzene refluxed 12 hrs. gives (479) o-(dibenzoylamino)phenyl benzoate, m.p. 170.5–171.5° (479).]

[C with o-aminophenol on warming, followed by distn. of reaction product (472), or C with o-aminophenol hydrochloride (468) (473) gives 2-phenylbenzoxazole-1,3, ndls. from dil. alc., lfts. from dil. HCl or dil. H₂SO₄, m.p. 103° (468) (472) (473) (474), volatile with steam, b.p. 314-317° (472) (corresp. B.PkOH, m.p. 104° (477), corresp. MeI quaternary salt, m.p. 196° dec. (478)).

[$\ddot{\mathbf{C}}$ (2 pts.) with o-aminophenol in aq. NaOH (448) or in pyridine + CHCl₃ (465), or $\ddot{\mathbf{C}}$ with o-aminophenol hydrochloride in $\mathbf{C}_6\mathbf{H}_6$ at 100° (468), or $\ddot{\mathbf{C}}$ + aq. NaOH with o-formylaminophenol (480), o-(acetylamino)phenol (481), or o-(benzoylamino)phenol (467), gives O,N-dibenzoyl-o-aminophenol (o-benzoylaminophenyl benzoate), ndls. from alc. (480) or EtOAc (465), m.p. 185° (467), 183–184.5° (480), 182–183° (482), 181–182° (476), 180° (481), 179° u.c. (465). — Note that this prod. on boilg. with aq. BaCO₃ (468) or for 2 days with alc. HCl (483) hydrolyzes at the ester leakage giving o-(benzoylamino)phenol, m.p. 169° (above).]

[Č with m-aminophenol [Beil. XIII-401, XIII₁-(128)] in pyridine + ether (484) cf. (485) gives m-(benzoylamino)phenol [Beil. XIII-416], ndls. from toluene, m.p. 174° (485) (486), 173° (484). — Note that the isomeric G-benzoyl-m-aminophenol (m-aminophenyl benzoate) is unreported. — Č with m-aminophenol in aq. NaOH gives (486) O,N-dibenzoyl-m-aminophenol (m-(benzoylamino)phenyl benzoate) [Beil. XIII-416], pr. from C₀H₆ or scales from abs. alc., m.p. 153° (486); this product with boilg. alc. KOH splits at the ester linkage giving (486) m-(benzoylamino)phenol (above), m.p. 174°.]

[C with p-aminophenol [Beil. XIII-427, XIII₁-(143)] in aq. NaOH (487), in pyridine (488), in alc. (489), or in ether + aq. NaOH (490) gives p-(benzoylamino)phenol (N-benzoyl-p-aminophenol) [Beil. XIII-469, XIII₁-(165)], cryst. from AcOH, m.p. 216-217° (487), 214-215° (489) (for review of earlier confusion see (487)). — Note that the isomeric O-

benzoyl-p-aminophenol (p-aminophenyl benzoate) [Beil. XIII-440], m.p. 153-154° (491) (492), 148° (465), has been reported only by indirect means. — Č with p-aminophenol on htg. (472), or in aq. NaOH (448) (487) (488) or in pyridine (488), or Č with p-aminophenol hydrochloride (489) gives O,N-dibenzoyl-p-aminophenol (p-(benzoylamino)phenyl benzoate) [Beil. XIII-470, XIII₁-(165)], cryst. from MeOH, EtOH, AcOH, or xylene, m.p. 235° (487) (467), 233-234° (489), 231° (472).]

The acylation of aminophenols (especially of the ortho series) and the relationships of the various multiple and mixed acyl derivatives have been extensively studied by Raiford ((493)-(511), incl.), Nelson ((512)-(517), incl.), and Bell (518) (519); the cited papers are arranged in chronological sequence for each worker.

Č with tertiary amines. Č with certain tertiary amines especially in dry ether solution (520) forms addition products; these are presumably quaternary ammonium salts but have been very inadequately studied cf. (524).

[\bar{C} with Me₂N in ether at 0° or in C₆H₆ at 80° fails to react (525). — \bar{C} with Et₂N in dry ether gives an immediate ppt. which increases on stdg. but appears to be a mixture of the expected addn. prod., \bar{C} . Et₂N, with triethylamine hydrochloride (520). — \bar{C} with triamylamine in dry ether after stdg. 2 months yields (520) long needles, m.p. 117°, whose analysis is in accord with "nearly pure" addn. prod., \bar{C} . (C₅H₁₁)₂N.]

[\bar{C} with N,N-dimethylaniline in dry ether in sunlight gives gradually hygroscopic crystals probably comprising the expected addn. prod., $\bar{C}.C_8H_{11}N$, (520). — \bar{C} with N,N-diethylaniline in dry ether gives (520) a crystn. prod. containing 71% of the expected $\bar{C}.C_{10}H_{16}N$.]

[\bar{C} with pyridine in dry ether gives (520) a ppt. apparently contg. only 31% of the expected addn. prod., $\bar{C}.C_5H_5N.-\bar{C}$ with pyridine in C_6H_6 gives (521) pyridine hydrochloride, m.p. 144°. — For study of \bar{C} with pyridine in pres. of Zn dust giving the free radical N-benzoylpyridinium see (522); for study of \bar{C} with pyridine + N,N-dimethylaniline + Cu powder at 100° for 5 hrs. giving 4-(p-dimethylaminophenyl)pyridine see (523).]

Note that \bar{C} with pyridine in pres. of various inorganic salts gives benzoic anhydride; for further details see text above under behavior of \bar{C} with miscellaneous inorganic salts.

 $\bar{\mathbf{C}}$ with arylhydrazines. $\bar{\mathbf{C}}$ (1 mole) with phenylhydrazine (2 moles) [Beil. XV-67, XV₁-(23)] in dry ether gives (526) N'-benzoyl-N-phenylhydrazine (also known as sym.-benzoyl-phenylhydrazine or β-benzoylphenylhydrazine) [Beil. XV-255, XV₁-(67)], pr. from alc., m.p. 168° (526) (527). [Note that the isomeric N-benzoyl-N-phenylhydrazine (also known as asym.-benzoyl-phenylhydrazine or α-benzoyl-phenylhydrazine) [Beil. XV-250, XV₁-(65)], m.p. 70°, has been obtained only by indirect means, e.g., from $\bar{\mathbf{C}}$ with sodio-phenylhydrazine (528) or from N-chlorobenzanilide with NaNH₂ (529). However, $\bar{\mathbf{C}}$ with phenylhydrazine hydrochloride in boilg. C_6H_6 (530) (531), or $\bar{\mathbf{C}}$ with dry K phenylhydrazine-β-sulfonate on htg. (526), or $\bar{\mathbf{C}}$ with α-benzoyl-phenylhydrazine in ether (532), or $\bar{\mathbf{C}}$ with β-benzoyl-phenylhydrazine on htg. (526), gives N,N'-dibenzoyl-N-phenylhydrazine (also called α,β-dibenzoyl-phenylhydrazine) [Beil. XV-261, XV₁-(68)], pr. from alc., m.p. 177–178° (526) (530); note that this prod. on hydrolysis with alc. NaOH gives (533) β-benzoyl-phenylhydrazine (above).]

 \tilde{C} with p-nitrophenylhydrazine [Beil. XV-468, XV₁-(130)] presumably gives N'-benzoyl-N-(p-nitrophenyl)-hydrazine [Beil. XV-479, XV₁-(140)], ndls. from alc., m.p. 193° (534), although this prod. is actually reported (534) only from benzoic anhydride (1:0595) with p-nitro-phenylhydrazine.

Č with 2,4-dinitrophenylhydrazine [Beil. XV-489, XV₁-(146)] in alc. suspension on warming gives (535) N'-benzoyl-N-(2,4-dinitrophenyl)-hydrazine [Beil. XV-492], or.-red lfts. from alc., m.p. 206-207° (535).

 \tilde{C} with diazomethane. [\tilde{C} added slowly to excess CH₂N₂ in ether at 0° gives (550) (551) (552) (553) ω -diazoacetophenone [Beil. VII-362, XXIV-142]; this product may be caused

to undergo the Wolff rearrangement giving (554) phenylacetoacetic acid derivs. (e.g., amide or anilide (554)), or may be caused to react with HCl to give phenacyl chloride (3:1212): for comprehensive survey and review of the behavior of acyl halides with diazomethane see (555).]

Č with miscellaneous nitrogen compounds. [For studies on the behavior of Č with indigo see (556) (557) (558) (559) (560) (561) (562) (563).]

BEHAVIOR OF C WITH ORGANOMETALLIC COMPOUNDS

Behavior of Č with Grignard reagents. Č with excess RMgX compounds in ether reacts in general to give the corresponding tertiary alcohols. Although extensive discussion of this reaction is manifestly infeasible here, the following examples are cited.

[C̄ with excess MeMgI gives (564) dimethyl-phenyl-carbinol [Beil. VI-506, VI₂-(477)]. — C̄ with EtMgI gives (93% yield (565)) diethyl-phenyl-carbinol [Beil. VI-548, VI₁-(269), VI₂-(506)]. — C̄ with n-PrMgBr gives (81% yield (565)) di-n-propyl-phenyl-carbinol [Beil. VI₁-(273), VI₂-(513)]. — C̄ with C₆H₅MgBr as directed gives (91.5% yield (565)) triphenylcarbinol [Beil. VI-713, VI₁-(349), VI₂-(686)] (1:5985) accompanied by (7% yield (565)) biphenyl (1:7175); for study of limiting reaction of C̄ with C₆H₅MgBr to formation of diphenyl ketone (benzophenone) (1:5150) see (566); note also that C̄ with C₆H₅MgBr in presence of CoCl₂ takes a different course yielding (567) benzoic acid, ethyl benzoate, biphenyl, benzophenone, phenylbenzoin, tetraphenylethylene oxide, and stilbene dibenzoate.]

[For interference of C with the Gilman color test for RMgX compounds see (568).]

[For study of relative reactivity of \bar{C} as compared with various other organic compounds in competition for C_6H_5MgBr see (569).]

Behavior of \tilde{C} with other miscellaneous organometallic compounds. This topic cannot be treated extensively, but the following examples, mainly from the recent literature, will serve as lead references.

- [$\bar{\mathbf{C}}$ with $\mathbf{C_6H_5Li}$ gives (570) no benzophenone and only 42% yield triphenylcarbinol (1:5985). $\bar{\mathbf{C}}$ with Na phenylacetylene (571) (572) or Ag phenylacetylene (572) gives (74% yield (571)) phenyl phenylethynyl ketone (benzoyl-phenylacetylene) [Beil. VII_498, VII_1-(275)].]
- $[\bar{C} + \text{EtCu} (573)]$ in ether gives (22% yield (573)) ethyl phenyl ketone (propiophenone) (1:5525). \bar{C} with C_6H_5Cu (573) in ether gives (55% yield (573)) benzophenone (1:5150).]
- $[\bar{C} + Et_2Hg \text{ gives (small yield (574)) propiophenone (1.5525).} --\bar{C} \text{ with (C_6H_6)_2Hg}$ in C_6H_6 gives (575) benzophenone (1:5150). -- \bar{C} with excess di-p-tolyl mercury in CCl₄ fails (576) to react.]
- [\bar{C} with Me₂Be gives (577) dimethyl-phenyl-carbinol [Bed. VI-506, VI₂-(477)]. \bar{C} with Me₂Cd gives (85% yield (578)) methyl phenyl ketone (acetophenone) (1:5515). \bar{C} with Et₂Cd gives (50% yield (578)) ethyl phenyl ketone (propiophenone) (1:5525). \bar{C} with (C₆H₅)₂Cd gives (57% yield (578)) diphenyl ketone (bezophenone) (1:5150). \bar{C} with Me₂Zn gives (579) methyl phenyl ketone (acetophenone) (1:5515). \bar{C} with Et₂Zn (580) (581) or with EtZnI (582) gives ethyl phenyl ketone (propiophenone) (1:5525).]
 - **D** Benzamide: cryst. from hot aq., m.p. 130°. [For methods of prepn. see above text under behavior of \tilde{C} with various inorganic nitrogen compounds.]
 - Benzanilide: lfts. from alc., m.p. 160°. [From C with aniline directly (583), in ether contg. dry K₂CO₃ (584), in C₆H₆ (585), in toluene (586), in pyridine (or other tertiary amines) (587), in dil. aq. HCl (588), in AcOH/aq. NaOAc (589), or aq. NaOH. For study of rate of reaction of C with aniline in aq. at various temperatures 0-60° (590),

- in C_6H_6 at 25° (591) cf. (585), in hexane at 25° (592), or in CCl₄ at 25° (592) see indic. refs. Note that \bar{C} with aniline hydrochloride in boilg. C_6H_6 gives almost quant yield (530) benzanilide.]
- Benz-o-toluidide: ndls. from AcOEt/acetone, m.p. 145-146° (594) (595), 144.3-144.6° cor. (586), 142-143° (593), 142° (587). [From C with o-toluidine (593) (594) in pres. of dil. (4%) aq. NaOH (595), or in pyridine (or other tertiary bases) (75% yield (587)), or in boilg. toluene (586).]
- Benz-m-toluidide: cryst. from dil. alc., m.p. 126° (587), 124.3-124.7° cor. (586), 125° (596). [From C with m-toluidine (596) in pyridine (or other tertiary bases) (80% yield (587)) or in boilg. toluene (586).]
- Benz-p-toluidide: ndls. from alc., m.p. 158° (597), 157.7-158.2° cor. (586), 157° (587).
 [From C with p-toluidine (598) (599) in pyridine (or other tertiary bases) (85% yield (587)) or in boilg. toluene (586).]
- Benz-α-naphthalide: ndls. from alc. or AcOH, m.p. 161-162° (600), 159-160° (601) cor. (608), 159° (587), 156° (602), 155-156° (603). [From C with α-naphthylamine (604) (602) in aq. NaOH (603), pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/aq. NaOAc (589). For mol. cpd. of benz-α-naphthalide with 1,3,5-trinitrobenzene, viz., C. C₆H₃(NO₂)₃, yel. ndls. from alc. soln. of components, m.p. 131-132° (605); see indic. refs. For behavior of C with α-naphthylamine in pres. of ZnCl₂ at 175-180° yielding 1-benzoylamino-4-benzoylamphthalene, m.p. 178°, 1-benzoylamino-2,4-dibenzoylnaphthalene, m.p. 224-226°, etc., see (606) (607).]
- D Benz-β-naphthalide: ndls. from C_6H_6 or AcOH, m.p. 162–163° (609), 162° (587), 161° (612), 157° (610), 156.5–157° cor. (608). [From \bar{C} with β-naphthylamine (611) (610) in ether + K₂CO₃ (612), in pyridine (or other tertiary bases) (80% yield (587)), or in AcOH/ag. NaOAc (589).]
- Benzhydrazide: m.p. 112°. [See above text under behavior of C with various inorganic nitrogen compounds, specifically with NH₂.NH₂.]
- β-Benzoylphenylhydrazine (N-Anilinobenzhydrazide): pr. from alc., m.p. 168°.

 [See above text under behavior of C with organic nitrogen compounds, specifically with arylhydrazines.]
- —— β-Benzoyl-p-nitrophenylhydrazine (N-(p-nitroanilino)benzhydrazide): ndls. from alc., m.p. 193°. See above text under behavior of C̄ with organic nitrogen compounds, specifically with arythydrazines.

$$D_4^{20} = 1.2686$$
 (5) $n_D^{20} = 1.5510$ (5) 198-200° (2) 198° at 760 mm. (3) 197-199° at 757 mm. (4) 54-56° at 8 mm. (5)

[For prepn. of \bar{C} from 6-chloro-2-aminotoluene [Beil. XII-836, XII₁-(389)] via diazotization and use of Cu₂Cl₂ reactn. (70% yield (2)) (1) (3) see indic. refs.; from 2,6-dichlorotoluenesulfonic acid-4 (itself obtd. by chlorination of p-toluenesulfonyl chloride and subsequent hydrolysis) by hydrolysis in conc. H₂SO₄ with superheated steam (yield 42-50% (5)) (4) (6) together with 2,3,6-trichlorotoluene (3:0625) as by-product (5) (6) see indic. refs.; for formn. of \bar{C} (together with other isomers) from toluene with Cl₂ in pres. of MoCl₅ (7) (8) (9), from o-chlorotoluene (3:8245) with Cl₂ in pres. of Fe (9) or Al/Hg (10), or from 2,6-dichlorobenzaldehyde hydrazone by Wolff-Kishner reduction (32-80% yield (19)) see indic. refs.]

\[C\] with Cl₂ in pres. of Al/Hg yields (11) 2,3,6-trichlorotoluene (3:0625); C\] at its b.p. in u.v. light treated with Cl₂ yields (5) 2,6-dichlorobenzyl chloride (3:0410) cryst. from lgr. or ether, m.p. 39-40° (5).]

[C with Br₂ at 170° in sunlight (2) yields (2) (12) 2,6-dichlorobenzyl bromide which on oxidn. with alk. KMnO₄ yields (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p. 143-144°.]

 $\bar{\mathbb{C}}$ on mononitration in cold with 2 pts. fumg. HNO₃ (11) or with mixt. of 2 pts. conc. HNO₃ (D=1.4) + 3 pts. conc. H₂SO₄ at 100° (3) yields 2,6-dichloro-3-nitrotoluene [Beil. V-332], ndls. from alc. + AcOH, m.p. 53° (3), 52-53° (11), 50° (13); note that the other possible isomer, viz., 2,6-dichloro-4-nitrotoluene, m.p. 65° (14), 63-64° (15), has been obtd. only by other means. — $\bar{\mathbb{C}}$ on dinitration with mixt. of 7 pts. fumg. HNO₃ (D=1.5) and 3½ pts. conc. H₂SO₄ at 100° yields (3) 2,6-dichloro-3,5-dinitrotoluene [Beil. V-345], ndls. from alc., m.p. 121-122° (3), 121° (4) (14); note that the isomeric 2,6-dichloro-3,4-dinitrotoluene, m.p. 130-131° (14), 129-130° (16), has been obtd. only by other means.

Č is extremely resistant to oxidn. either with dil. HNO₃ (9) (1) (3), aq. alk. KMnO₄ (4) (12), acid KMnO₄ (12), KMnO₄ in acetone (4), CrO₃ in H₂SO₄ or AcOH (12), or K₂Cr₂O₇ in H₂SO₄ (12); by conversion of Č with Br₂ to 2,6-dichlorobenzyl bromide (see above) and oxidn. of this with alk. KMnO₄ (2) (12) 2,6-dichlorobenzoic acid (3:4200), m.p. 143-144°, is obtd. in 57% yield (12).

Č on sulfonation with fumg. H₂SO₄ (3) yields 2,6-dichlorotoluenesulfonic acid-3 (corresp. sulfonyl chloride, m.p. 60° (3) (13), corresp. sulfonamide, m.p. 204° (3) (13), 199-201° u.c. (17)); Č on treatment with chlorosulfonic acid in CHCl₃ as directed (17) cf. (18) yields 2,6-dichlorotoluenesulfonyl chloride-3, m.p. 54-56° u.c. (17), 60° (3) (13) (18).

For f.p./compn. diagram of system: $\bar{C} + 3,4$ -dichlorotoluene (3:6355) see (1); the eutectic conts. 48% \bar{C} and freezes about -38° (1).

[For prepn. of \bar{C} from 2-chloro-4-aminotoluene [Bcil. XII-988, XII₁-(435)] via diazotization and use of Cu₂Cl₂ reaction (yield: 72% (5), 30% (6)) see indic. refs.; similarly from 4-chloro-2-aminotoluene [Beil. XII-835, XII₁-(389)] see (2); from 2,4-diaminotoluene [Beil. XIII-124, XIII₁-(40)] via tetrazotization and use of CuCl₂ reaction (yield: 75% (7), 57% (16), 45% (4)) (3) see indic. refs.; from toluene + AlCl₃ + SO₂Cl₂ at 70° (68% yield) see (10).]

[For formn. of \bar{C} (58% together with 42% 3,4-dichlorotoluene (3.6355) from p-chlorotoluene (3.8287) with Cl_2 in pres. of Fe see (1); for formn. of \bar{C} (together with other isomers) from toluene with Cl_2 in pres. of FeCl₃ or MoCl₅ (8) or by electrolysis in conc. HCl/AcOH soln. (9) see indic. refs.; from p-chlorotoluene (3.8245) or p-chlorotoluene (3.8287) with Cl_2 in pres. of FeCl₃ or MoCl₅ (8) or Al/Hg (11) see indic. refs.; from potassium salt of 2,4-dichlorotoluenesulfonic acid-5 (12), sodium salt of 2,4-dichlorotoluenesulfonic acid-6 (12), or the sodium salt or amide of 2,4-dichlorotoluenesulfonic acid-3 (12) by hydrolysis in H_3PO_4 with steam at 240° see indic. refs.]

[C with Cl₂ in pres. of Fe (13) or of Al/Hg (14) yields 2,4,5-trichlorotoluene (3.2100) together with other isomers; C with Br₂ at 180-200° yields (15) 2,4-dichlorobenzal dibromide which upon hydrolysis with conc. H₂SO₄ as directed gives 92% overall yield 2,4-dichlorobenzaldehyde (3:1800), m.p. 74.5° (15) (for similar reaction with Cl₂ see (5)).]

[C with AlCl₃ + phthalic anhydride gives (60% yield (16)) (17) o-(2,4-dichloro-5-methyl)benzoyl-benzoic acid, cryst. from hot toluene, m.p. 140° (16); this prod. htd. 2 hrs. at 100° with 20 pts. conc. H₂SO₄ + 0.2 pt. H₃BO₃ ring-closes yielding 2,4-dichloro-1-methylanthraquinone, yel. cryst. from CHCl₃, m.p. 155° (16).]

 \bar{C} on mononitration, e.g., with cold mixt. of 2 pts. conc. HNO₃ (D=1.42) + 3 pts. conc. H₂SO₄ (2), yields (2) (8) 2,4-dichloro-5-nitrotoluene [Beil. V-332, V₁-(163)], long hard ndls. from alc., m.p. 54-55° (2), 55° (18), 53° (8), 49-50° (19); \bar{C} on dinitration, e.g., with 7 pts. fumg. HNO₃ (D=1.5) + 3½ pts. conc. H₂SO₄ (2), yields (2) (8) (10) 2,4-dichloro-3,5-dinitrotoluene [Beil. V-345, V₁-(169)], ndls. from MeOH, m.p. 104° (2) (18) (10)

 \tilde{C} on oxidn. with dil. HNO₃ in s.t. at 130-150° (2) (6) (12), with alk. KMnO₄ (70% yield (25)), with Na₂Cr₂O₇ + H₂SO₄ (60% yield (20)), or on electrolytic oxidn. (6.5% yield (21)) gives 2,4-dichlorobenzoic acid (3:4560), m.p. 164°.

 \ddot{C} on sulfonation with fumg. H₂SO₄ yields (2) (22) 2,4-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 72° (22), 71° (2) (24), corresp. sulfonamide, m.p. 176° (2) (22); 175–176° u.c. (23)); \ddot{C} on treatment with chlorosulfonic acid in CHCl₃ as directed (23) cf. (24) yields 2,4-dichlorotoluenesulfonyl chloride, m.p. 71–72° u.c. (23), 71° (24).

3:6327 BENZAL (DI)CHLORIDE CHCl₂
$$C_7H_6Cl_2$$
 Beil. V - 297 (Benzylidene (di)chloride, α,α -dichlorotoluene; α,ω -dichlorotoluene) V_2 -(232)

B.P. [207° cor. (1)]
$$-16.0^{\circ}$$
 to -16.2° cor. (9) $D_4^{14} = 1.2557$ (1) -16.1° cor. (10) $n_D^{20} = 1.5503$ (8) 205.2° at 760 mm. (2) -16.4° (11) 1.5502 (13) 205.15° at 760 mm. (3) -17.0° (12) 205° (37) -17.4° (2) $D_4^{0} = 1.2699$ (4) $n_D^{19.4} = 1.5515$ (14) 203.5° (5) See Note 2. See Note 3. (5) See Note 2. See Note 3. (6) 118° at 60 mm. (7) Note 1. The b.p. of 214° given by (15) appears without 104–105° at 30 mm. (8) See Note 1. (9) $D_4^{135.5} = 1.2122$ (4); $D_4^{79.2} = 1.1877$ (4); $D_4^{135.5} = 1.2127$ (4).

Note 3. The value of n_{20}^{20} for mixtures of \bar{C} with benzyl chloride (3:8535) ($n_{20}^{20} = 1.5391$ (13)) is a linear function of their composition (13).

[See also benzyl chloride (3:8535) and benzotrichloride (3:6540).]

Ordinary comml. \bar{C} , usually obtd. by chlorination of toluene, frequently conts. benzyl chloride (3:8535) and benzotrichloride (3:6540), which are difficult (if not impossible) to remove by distillation methods. For purification of \bar{C} by repeated fractional freezing see (5); for patent on purification of \bar{C} from inorganic contaminants see (16). The best approach to pure \bar{C} is from benzaldehyde by action of PCl₅ (see below).

 \overline{C} is insol. aq.; sol. alc., ether, or below -20° in equal vol. of pet. ether (17).

[For a method for quant. detn. of $\bar{\mathbf{C}}$ in mixtures with benzyl chloride (3:8535) and benzotrichloride (3:6540) see (18); for a rapid combustion method for detn. of chlorine in $\bar{\mathbf{C}}$ see (19).]

PREPARATION OF C

From benzaldehyde. [For prepn. of \bar{C} from benzaldehyde (1:0195) with PCl₅ (yield: 80-85% (20)) (21) in CHCl₃ (9), with POCl₃ in C₆H₆ (22), with SOCl₂ (23) (24), with COCl₂ (3:5000) in s.t. at 120-130° (25), with oxalyl (di)chloride (3:5060) in s.t. at 130-140° for 2 hrs. (26), or with succinyl (di)chloride (3:6200) in s.t. at 100° (27) see indic. refs.]

From toluene. [For prepn. of \overline{C} from toluene (1.:7405) with SO₂Cl₂ (2 moles) in presence of a trace of dibenzoyl peroxide refluxed for 6 hours (90% yield (8)), with SOCl₂ in s.t. at 230-250° (28), with PCl₅ in s.t. at 190-195° for 2 hours (29), or with NOCl at 350° (30) see indic. refs.]

[For studies of formn. of C from toluene (1:7405) with Cl₂, especially in light, see the scientific papers (13) (31) (32) (33) and patents (34) (35) (36).]

From other sources. [For formn. of \tilde{C} from benzyl chloride (3:8535) with Cl_2 (37) (38), with NOCl at 150° (39), or with PbCl₄.2NH₄Cl (40) see indic. refs.; from various benzyl ethers by cleavage with PCl₅ see (41); from α -chlorobenzyl chloroformate [Beil. VII-211] by loss of CO_2 on distn. see (42); or from benzaldazine with NOCl see (43).]

CHEMICAL BEHAVIOR OF C

Pyrolysis. [Č passed over red-hot Pt wire gives (44) HCl and both cis (3:1380) and trans (3:4210) tolane dichlorides $(\alpha, \alpha'$ -dichloro- α, α' -diphenylethylenes).]

Reduction. [\bar{C} with H_2 in pres. of Pd/CaCO₃ (45) or Ni (46) in alc. KOH loses all its halogen as HCl (use in quant. detn.) but the corresp. org. reduction prod. has not been characterized. — \bar{C} with H_2 in pres. of colloidal Pd in dil. alc. gives (47) toluene (1:7405), benzyl chloride (3:8535), and α -stilbene dichloride (3:4854). — \bar{C} in MeOH/KOH with hydrazine hydrate in pres. of Pd gives (19% yield (48)) α -stilbene dichloride (3:4854).]

Hydrolysis. C upon hydrolysis yields benzaldehyde (1:0195) and HCl; frequently the reaction is so executed that the benzaldehyde reacts further according to the nature of the environment; examples of both types of reaction are cited below.

[\bar{C} with aq. in s.t. at 140–160° (1), with aq. in pres. of ferric salts (49) or metallic Fe (50) below 100°, with 50% aq. acetone at 72° (59), with conc. H_2SO_4 (2 moles) at 50° subsequently poured into aq. (51), with H_3BO_3 (1 mole) at 130–160° (52) (note that benzyl chloride (3:8535) is unaffected while benzotrichloride (3:6540) gives benzote acid (1:0715)), with boilg. aq. K_2CO_3 (53), with moist NiCO₃ at 120° or moist CoCO₃ at 60° for 3 hrs. (60), with aq. Na₂SO₃ at 110° (54), with ZnO in C_6H_6 followed by aq. (55), with anhydrous formic acid (56) (57), or with anhydrous oxalic acid at 130° (58) gives (yields: 85% (52), 82% (58), 79% (51), 76% (60), 75% (59), 70% (54), 30% (55)) benzaldehyde (1:0195).]

[For study of kinetics of hydrolysis of \bar{C} at 30° and 60° in aq. acetone either directly or in pres. of H_2SO_4 or KOH see (61), with aq. or KOH in 95% alc. see (62): for study of influence of substituents on hydrolysis of \bar{C} see (61) (63) (64).]

[\bar{C} with AcOH + ZnCl₂ gives (65) benzaldehyde (1:0195) + acetyl chloride (3:7065) + HCl. — \bar{C} with anhydrous alkali acetate at 180–200° for 10–20 hrs. gives (66) cinnamic acid (1:0735). — \bar{C} with AgOAc (32) (1) (67) or with PbO in AcOH (68) gives benzal diacetate [Beil. VII-210, VII₁-(119)], m.p. 45–46°.]

Alcoholysis. [C̄ with EtOH + ZnCl₂ gives (65) benzaldehyde (1:0195) + ethyl chloride (3:7015) + HCl; an analogous reaction occurs with C̄ + ZnCl₂ + aromatic alcohols (69). — C̄ with sodium alcoholates under ord. press. gives the corresp. benzaldehyde acetals: e.g., C̄ with MeOH/NaOMe at 100° for 15 hrs. gives (15% yield (70)) (67) benzaldehyde dimethylacetal [Beil. VII-209], b.p. 194-196°; C̄ with EtOH/NaOEt at 100° for 24 hrs. gives (33% yield (70)) (67) benzaldehyde diethylacetal [Beil. VII-209, VII₁-(119)], b.p. 222°. — However, C̄ with sodium alcoholates under press. in s.t. gives (70) benzaldehyde (1:0195) together with the corresp. alkyl chlorides.]

Substitution. Chlorination. [C with Cl₂ in pres. of I₂ gives (32) p-chlorobenzal (di)chloride (3:6700). — Note, however, that C with excess liquid Cl₂ in s.t. in sunlight gives (71) an addn. prod., viz., benzal (di)chloride hexachloride, m.p. 153° (71); also that C with NOCl at 150° substitutes in the side chain giving (39) benzotrichloride (3:6540). — Note further that C with SO₂Cl₂ + dibenzoyl peroxide does not react even when refluxed for 20 hrs. (8); cf. prepn. of C from toluene by this method (above).]

Bromination. [C with Br₂ in pres. of metallic beryllium gives (72) p-bromobenzal (di)-bromide, b.p. 170-171° at 19 mm. (72). — C with Br₂ at 120-140° gives (57) benzodichloride bromide, C₆H₅CCl₂Br, b.p. 88-94° at 1 mm., and benzochloride dibromide, C₆H₅OClBr₂, b.p. 98-103° at 1 mm.]

Sulfonation. [\tilde{C} with SO₃ does not sulfonate but instead undergoes hydrolysis: e.g., \tilde{C} with sulfuric acid monohydrate at 35° gives (73) a mixt. of benzaldehyde-sulfonic acids in the ratio 10% o-+30% m-+60% p-, although these products cannot be isolated as such.] Nitration. [All three isomeric mononitro derivatives of \tilde{C} are known, viz., o-nitrobenzal

(di)chloride [Beil. V-332, V_{1} -(163)], m.p. 27.5° (63), 26–26.5° (61), 25.7° (11); *m*-nitrobenzal (di)chloride [Beil. V-332, V_{1} -(163), V_{2} -(254)], m.p. 64.5–65° (61), 64.5° (11); *p*-nitrobenzal

(di)chloride [Beil. V-332, V₁-(163), V₂-(255)], m.p. 43.0–43.5° (61), 43° (63), 42.8° (11); however, they are best prepared by reaction of the corresp. nitrobenzaldehydes with PCl₅ (74) (75). — For thermal anal. of mixtures of the three nitrobenzal (di)chlorides see (11). — For study of the mononitration of \bar{C} with anhydrous HNO₃ in Ac₂O at 20° giving about 23% o-+34% m-+43% p- see (11) cf. (76). — Note that neither dinitro nor trinitro derivatives of \bar{C} have been reported.]

Behavior with other inorganic reactants. \bar{C} with metals. $[\bar{C}$ with Na on htg. gives {1} stilbene (1:7250). For behavior of \bar{C} with Na in liq. NH₃ giving dibenzyl, benzylamine, and other products see (80). — \bar{C} with equal wt. of Cu powder at 100° for 12 hrs. couples with loss of 2 Cl giving (77) α -stilbene dichloride (3:4854). — \bar{C} on boiling with Cu in aq. Na₂CO₃ for 24 hrs. gives (78) benzaldehyde-copper, 2C₆H₅ CHO Cu, green cryst., decg. about 220° without melting. — \bar{C} with Cu in pyridine reacts vigorously (79), but the products have not been characterized.]

C with inorganic salts [C with AlCl₃ in pet. eth. or CS₂ evolves HCl and resinifies (37); C with yery small amt. AlCl₃ at -15° gives (small yield (81)) phenyl-m-dichloromethyl-phenylchloromethane, b.p. 285° at 750 mm.]

[Č with SbF₃ on htg. gives (82) (83) benzal (di)fluoride [Beil. V-290, V₁-(149), V₂-(224)], b.p. 139.95° (83), $D_{-}^{20} = 1.13572$ (84), $n_{D}^{20} = 1.45775$ (84)]

[C with alc. Na₂S under N₂ gives (85) cf. (86) monomeric thiobenzaldehyde, but this cannot be isolated since it immediately undergoes polymerization to β-trithiobenzaldehyde and/or other reactions. — C with alc. NaSH refluxed 3-4 hrs. gives (86) dibenzyl disulfide [Beil VI-465, VI₁-(229), VI₂-(437)], m.p. 69-70° (86).]

[\bar{C} with conc. aq. NH₄OH on stdg 4 months at ord temp. (87), or \bar{C} with alc. NH₄OH in s.t. at 100° (88), or \bar{C} with alc. NH₄OH + trace of Zn dust at room temp. (88), gives hydrobenzamide [Beil. VII-215, VII₁-(120)], m p. 110°, doubtless through intermediate hydrolysis to benzaldehyde since this can sometimes (88) be isolated.]

Behavior with organic reactants. \bar{C} with hydrocarbons [\bar{C} with C_6H_6 in pres. of AlCl₃ (37) (89), Cr (90), BeCl₂ at 130–140° for 20 hrs. (91), or Zn dust (92) undergoes Friedel-Crafts reaction giving (yields: 28 7% (91), 19.5% (90), 13 4% (37)) triphenylmethane (1:7220) frequently accompanied (37) (89) by other products such as diphenylmethane (1:7120) and triphenylchloromethane (3:3410). — \bar{C} with $C_6H_6+Al+H_6Cl_2$ at 50–55° gives (93) cf. (89) 9, 10-diphenyl-9, 10-dihydroanthracene [Beil. V-745, V₂-(681)], m.p. 164° (89), 159° (93).]

[\bar{C} with toluene in pres. of BeCl₂ refluxed 3 hrs. gives (73% yield (91)) phenyl-di-p-tolylmethane (4,4'-dimethyl-triphenylmethane) [Beil V-712, V₁-(352), V₂-(623)], accompanied by other products. — \bar{C} with toluene + Al + HgCl₂ at 60-70° for 2 hrs. gives (93) a hydrocarbon C₂₈H₂₄, m.p. 185°, possibly having the structure 9,10-di-p-tolyl-9,10-dihydroanthracene.]

[\bar{C} with o-xylene (1:7430) + AlCl₃ in acetylene tetrachloride (3:5750) as solvent gives (very small yield (94)) 2,3,6,7-tetramethyl-9,10-diphenylanthracene, m.p. 312°; note that this product has composition $C_{30}H_{26}$ and is not a dihydroanthracene deriv.]

[For use of \tilde{C} + conc. H_2SO_4 as a color test for various aromatic hydrocarbons see (95) (96).]

 \bar{C} with phenols. [\bar{C} with phenol at 120° for 10 hrs. condenses with loss of HCl giving (87% yield (70)) 4,4'-dihydroxy-triphenylmethane (leucobenzaurin) [Beil. VI-1042, VI₁-(1010)], ndls. from aq. alc. or from CHCl₃, m.p. 160-161° (corresp diacetate, m.p. 115° (97)): this prod. is also obtd. from benzaldehyde (1:0195) by condensation with phenol (1:1420) in pres. of H₂SO₄ (yields: 25% (98), 22% (99)) or H₃PO₄ (100): note that the isomeric benzaldehyde diphenylacetal is unreported. For formn. of resin from \bar{C} with phenol see (101).]

[\tilde{C} with 2 moles β -naphthol (1:1540) on htg. condenses with loss of HCl + H₂O giving (97% yield (102)) (103) 9-phenyl-1,2,7,8-dibenzoxanthene [Beil. XVII-98], pr. or tbls. from AcOH, m.p. 190-191° (103), 190° (102); this prod. is also obtd. from benzaldehyde (1:0195) by condensation with β -naphthol in AcOH in s.t. at 200° for 2 days (104) or in pres. of H₂SO₄ (104) at 100°; see also under benzaldehyde (1:0195) for use as test for latter.]

 \bar{C} with amines. [\bar{C} with aniline (2 moles) in pres. of Zn dust (92) or BeCl₂ at 120–125° for 2 hrs. (91) condenses giving (54% yield (91)) 4,4'-diamino-triphenylmethane [Beil. XIII-274, XIII₁-(89)], cryst. from C₆H₆ with 1 mole solvent, m.p. 106° (106), 104–105° (92), cryst. from dry ether without solvent, m.p. 139–140° (106), 139° (107) (corresp. diacetyl deriv., m.p. 233–234° (108) (109)); this compound is also obtd from benzaldehyde (1:0195) by condensation with 2 moles aniline in various ways, e.g., see (108) (106) (107).]

[Č with N,N-dimethylaniline (2 moles) in pres. of ZnCl₂ at 100° (110) condenses giving 4,4'-bis-(dimethylamino)-triphenylmethane (leuco-Malachite Green) [Beil. XIII-275, XIII₁-(89)], cryst. from C_6H_6 or alc. in 3 forms, mp. 102° (111) (112), m.p. 93–94° (111), 92–93° (112), and 77° (112) cf. (111); thus prod is also obtd from benzaldehyde (1:0195) by condensation with 2 moles N,N-dimethylaniline in various ways, e.g., with ZnCl₂ at 100° (113) (112), or with POCl₃ (alm. 100% yield (114))

[For study of reactivity of C toward pyridine or piperidine see (115).]

 \bar{C} with other nutrogenous reactants. [\bar{C} (excess) with thiourea at not above 150° gives (116) (117) a salt, $C_9H_9N_3S_2$ HCl, m.p. 236° (117), regarded as 4,6-di-imino-2-phenyl-1,3,5-dithiazane (117). — For analogous behavior of \bar{C} with N-phenylthiourea and with N-(p-tolyl)-thiourea see (117) [

[C with Zn salt of o-aminophenyl mercaptan in AcOH/NaOAc refluxed 30 min. in current of H₂S gives (low yield (118)) 2-phenylbenzothiazole, m.p. 114° cor]

 \bar{C} with organometalic reactants. [\bar{C} with MeMgI gives (22% yield (119)) α -stilbene dichloride (3:4854) + ethane but no isopropylbenzene (cumene) or sym.-dimethyldiphenylethane; however, \bar{C} with MeMgCl gives (120) no α -stilbene dichloride but instead a mixture of four other compds., viz., isopropylbenzene (cumene) (1:7440), 1-chloro-1,2-diphenylpropane, and two forms of 2,4-diphenylbutane.]

[\bar{C} with C_6H_6MgBr gives (119) cf. (121) triphenylmethane (1:7220) + α -stilbene dichloride (3:4854) + biphenyl (1:7175) |

[C with Me₂Zn gives (122) isopropylbenzene (cumene) (1:7440).]

[C does not react with Hg di-p-tolyl even on refluxing in toluene for 300 hrs. (123).]

- ₱ Hydrolysis to benzaldehyde: C on boilg. with 10% K₂CO₃ soln. gives benzaldehyde (1:0195); after acidification with HCl the benzaldehyde may be detected with fuchsin aldehyde reagent. (Dif. from pure benzyl chloride (3:8535) or pure benzotrichloride (3:6540).)
- **©** Benzaldehyde phenylhydrazone: m.p. 156° u.c. (From \bar{C} with 3 moles phenylhydrazine refluxed in alc. for 2 hrs. (55% yield {124}); note that from the mother liquor small amounts of an isomeric (γ) benzaldehyde phenylhydrazone, m.p. 154–155°, are obtd. (124).]
- Benzaldehyde semicarbazone: m.p. 219-220° u.c. (124). [From Č (3.2 g.) with semicarbazide hydrochloride (4.4 g.) + Na₂CO₃ (2.1 g.) refluxed a few hrs. in alc. and the ppt. recrystd. from hot aq. (124); note that the m.p. of this prod. varies somewhat with rate of htg. cf. (1:0195).]

B.P. 208° M.P. 63°

61-62° at 3 mm. (8)

See 3:1400. Division A: Solids.

[For prepn. of \tilde{C} from 2-chloro-3-aminotoluene [Beil. XII-870, XII₁-(404)] via diazotization and use of Cu_2Cl_2 reaction (alm. quant. yield (2), 64% (8)) see indic. refs.; for formn. of \tilde{C} (together with other dichlorotoluenes) from toluene or o-chlorotoluene (3:8245) with Cl_2 in pres. of FeCl₃ or $MoCl_5$ see (3) (4), from o-chlorotoluene + Cl_2 + Al/Hg see (4).]

[$\bar{\mathbf{C}}$ with Cl₂ in pres. of Al/Hg gives (70% yield (5)) 2,3,4-trichlorotoluene (3:0425), m.p. 41°.] [$\bar{\mathbf{C}}$ with Br₂ at 180–200° gives (8) 2,3-dichlorobenzal (di)bromide (not isolated) which on hydrolysis with conc. H₂SO₄ gives (71% yield (8)) 2,3-dichlorobenzaldehyde (3:1480).]

 \bar{C} on mononitration with conc. HNO₃ (6) or cold mixt. of 2 pts. conc. HNO₃ + 3 pts. conc. H₂SO₄ (2) yields 2,3-dichloro-4-nitrotoluene [Beil. V-332], ndls. from alc. + AcOH, m.p. 50.5-51.5° (2), 51° (6); \bar{C} on dinitration with mixt. of 7 pts. fumg. HNO₃ + 3.5 pts. conc. H₂SO₄ yields (2) 2,3-dichloro-4,6-dinitrotoluene [Beil. V-345], cryst. from AcOH or alc., m.p. 71-72° (2).

C on oxidn. with alk. KMnO₄ (6) or with dil. HNO₃ for some hrs. in s.t. at 140° (2) (6) yields 2,3-dichlorobenzoic acid (3:4650), m.p. 166° (6), 163° (2).

Č on sulfonation with 2 pts. 10% oleum at 50° gives (7) mixt. of 89% 2,3-dichlorotoluene-sulfonic acid-6 (corresp. sulfonyl chloride, m.p. 51-52° (7), corresp. sulfonamide, m.p. 228° (7)) and 11% 2,3-dichlorotoluenesulfonic acid-5 (corresp. sulfonyl chloride, m.p. 87° (7), corresp. sulfonamide, m.p. 185° (7)).

Oil with fragrant odor. - Insoluble aq.

[For prepn. of C from sym.-heptachloropropane (3:6860) by loss of HCl in presence of AlCl₃ in CCl₄ at 60-70° (83% yield) see (3); from asym.-heptachloropropane (3:0200) by htg. at 250-420°, especially in presence of ZnCl₂ or CuCl (4) (with latter tetrachloroethylene (3:5460), is also formed (4) (5)), or by htg. with ale KOH at 50-60° (90% yield (6)) (1); from heptachloro-n-butyraldehyde [Beil. I₁-(346)] by actn. of 2 moles NaOEt see (7).]

 \tilde{C} with AlCl₃ + 1 mole trichloroethylene (3:5170) in CH₂Cl₂ (3:5020) or CHCl₃ (3:5050) at 30-37° gives (82% yield (6)) 1,1,2,3,3,4,5,5,5-nonachloropentene-1, colorless liq. with cedar-like odor, b.p. 128° at 2-3 mm., 86° at 0.2 mm., $D_2^{20} = 1.812$, $n_2^{20} = 1.5703$ (6); with excess trichloroethylene (3:5170) prod. is mixt. consisting exclusively of two dodecachloroheptenes, $C_7H_2Cl_{12}$, one m.p. 94-96°, the other, m.p. 58-62° (6).

 \bar{C} with AlCl₃ + 1,2-dichloroethylene (3:5030) in CH₂Cl₂ soln. yields (8) a single 1,1,2,3,-3,4,5,5-octachloropentene-1, b.p. 145-147° at 11 mm., 113-113.5° at 2 mm., $D_{21}^{21} = 1.749$, $n_{21}^{21} = 1.5607$ (8). [This product with conc. H₂SO₄ gives (80% yield (8)) a mixt. of pentachlorobutenecarboxylic acids (8).]

Č forms with AlCl₃ at 80° a yel. cryst. addn.-prod. sparingly sol. in CCl₄ but regenerating Č upon treatment with aq. (8).

 \tilde{C} on cautious warming with conc. H₂SO₄ (9) (10) (2) (11) or on boilg. with an aqueous suspension of BaCO₃ (2) yields α,β,β -trichloroacrylic acid (3:1840) spar. sol. cold aq., eas. sol. hot aq., pr. from CS₂, m.p. 76° (2).

Č does not add Br₂ (10), but Č in sunlight adds Cl₂ yielding (10) octachloropropane (3:4450) q.v.

 \bar{C} with alc. NaOEt yields (1) triethyl ortho- α,β,β -trichloroacrylate, b.p. 236-237°, $D_4^{20}=1.2183$, $n_D^{20}=1.4649$ (1). [This ortho ester on htg. with 2 vols. conc. HCl yields (1) ethyl α,β,β -trichloroacrylate, b.p. 192-194°, $D_4^{20}=1.3740$, $n_D^{20}=1.4839$ (1), which can be hydrolyzed by conventional methods to α,β,β -trichloroacrylic acid (see above).]

[For prepn. of \bar{C} from decachlorodiethyl ether (3:1676) by treatment with alc. K_2S see (1).]

C with Cl₂ in sunlight adds 2 moles halogen yielding (1) decachlorodiethyl ether (3:1676), m.p. 69°.

 $\ddot{\mathbf{C}}$ with Br₂ in sunlight adds 2 moles halogen yielding (1) bis- $(\alpha,\beta$ -dibromo- α,β,β -trichloro-ethyl) ether, m.p. 96° (1).

3:6373 (1) Malaguti, Ann. chim. (3) 16, 19-28 (1846).

[See also ethyl α -chloroacetoacetate (3:6207).]

Colorless limpid liq. which soon turns yellow (4). — Almost insol. aq. but miscible with most org. solvents. — [Note that purity of material of earlier workers (5) has been seriously questioned (2).]

[For prepn. of \bar{C} from acetylketene (ketene dimer (6) (7)) by conversion with Cl_2 to γ -chloroacetoacetyl chloride (3:9088) and reactn. of the latter with excess abs. EtOH at 0° see (3); from ethyl chloroacetate (3:5700) (2 moles) with Mg (1 mole) in dry ether contg. HgCl₂ (58% yield (1)) cf. (19) or with Mg in dry ether contg. I₂ (35% yield (4)) or with

Al/Hg in pres. of a trace of EtOH (8) see indic. refs.; from chloroacetaldehyde (3:7212) with ethyl diazoacetate see (5); from ethyl γ -chloro- β -hydroxy-n-butyrate [Beil. III-310, III₁-(116)] by careful oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (poor yield) see (9).]

 \bar{C} on hydrolysis with aq. HCl for 3 hrs. undergoes ketonic splitting yielding (1) chloroscetone (3:5425) + CO₂ + EtOH (note that this does not distinguish \bar{C} from ethyl α -

chloroacetoacetate which yields same products).

[Č with alc. NaOEt at 100° undergoes bimolecular condensation with loss of 2 HCl yielding (10) diethyl succinylosuccinate [Beil. X-894, X₁-(434)], m.p. 125-126° (10); this same condensation is also effected by other alkaline agents, e.g., sodium phenolate, dil. aq. NaOH, NH₄OH, NH₃ in ether, KOAc alone or in pres. of alc. or C₆H₆, diethyl sodiomalonate or Me₂NH in C₆H₆, or K phthalimide (10).]

[Č with ethyl orthoformate (1:3241) in Ac₂O refluxed for $\frac{1}{2}$ hr. ppts. on cooling (45% yield (11)) ethyl γ -chloro- α -ethoxymethylene-acetoacetate, colorless ndls. from alc. or C₆H₆, m.p. 98° (11).]

Note that \bar{C} is capable of displaying keto-enol tautomerism as is shown by the following reactions:

 \bar{C} with FeCl₂ soln. gives red coloration (1) (4) (9) (19); \bar{C} conts. 10.9% enol, but 4% soln. of \bar{C} in ether conts. 53% enol. (19).

 $\bar{\rm C}$ forms a series of metallic salts of the enolic form; these are in general insol. in aq. but soluble in org. solvents: e.g., ${\rm Cu}({\rm C}_6{\rm H}_8{\rm O}_3{\rm Cl})_2$ (from $\bar{\rm C}$ on shaking with aq. ${\rm Cu}({\rm OAo}_2)$, green ndls. from ${\rm C}_6{\rm H}_6$, m.p. 168–169° dec. (9) (4) cf. (19), 167.5° dec. (1), 163° (8); Mg-(C₆H₈O₃Cl)₂ (from $\bar{\rm C}$ shaken with aq. MgSO₄ + NH₄Cl), m.p. 170° (1); Zn(C₆H₈O₃Cl)₂ (from $\bar{\rm C}$ on shaking with NH₄OH/ZnSO₄), m.p. 121° (1); Ni(C₆H₈O₃Cl)₂ (from $\bar{\rm C}$ on shaking with Ni(OAc)₂ + NH₄OH), m.p. 131–132° (1); other metals behave similarly (1).

 $\ddot{\mathbf{C}}$ couples with diazonium salt solns. in pres. of NaOAc yielding the corresp. α -(arylhydrazones) of ethyl γ -chloro- α , β -diketo-n-butyrate (ethyl γ -chloro- α -(arylazo)aceto-acetates (cf. dif. behavior of isomeric ethyl α -chloroacetoacetate (3:6207)): e.g., $\ddot{\mathbf{C}}$ with benzenediazonium chloride soln. in pres. of NaOAc at 0° gives (12) (13) ethyl γ -chloro- β -keto- α -phenylhydrazono-n-butyrate, sparing sol. yel. ndls. from alc., m.p. 92-93° (12) (13), 92° (14) (note that this prod. on htg. with alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-phenylpyrazole, colorless pr. from alc., m.p. 85° (14) (15)); similarly $\ddot{\mathbf{C}}$ with p-nitrobenzenediazonium chloride soln. in pres. of NaOAc at 0° gives (16) ethyl γ -chloro- α -(p-nitrobenzeneazo)acetoacetate, yel. ndls. from alc., m.p. 135° (16) (note that this prod. with hot alc. KOAc loses HCl and ring-closes to 3-carbethoxy-4-hydroxy-1-(p-nitro)phenylpyrazole, colorless ndls. from AcOH, m.p. 220° (16). — [For analogous reactions of $\ddot{\mathbf{C}}$ with numerous other diazonium salts see the papers represented by (16) (14) (17).]

 \bar{C} with thiourea on warming in alc. for 4 hrs. loses HCl and ring-closes yielding (9) ethyl (2-aminothiazolyl-4)acetate, colorless cryst. from C_6H_6 , m.p. 94° (18), 74° (9) (one of these is probably a misprint for the other).

-TRICHLORO- n -BUTYRATE $C_0H_0O_2Cl_3$ Beil. II - 281 II_1 — Cl_3 — Cl_4 — Cl_5 — C

[For prepn. of \bar{C} from α,α,β -trichloro-n-butyric acid (3:1280) in EtOH with 10% conc. H₂SO₄ in s.t. at 100° for 3 days see (2); note that the acid esterifies with difficulty and attempts to use the dry HCl method give only very poor yields (2).]

 \bar{C} with Zn dust in moist ether loses HCl giving (almost 100% yield (3)) ethyl α -chlorocrotonate (3:8523).

3:6380 (1) Judson, Ber. 3, 787 (1870). (2) Perkin, J. Chem. Soc. 65, 424 (1894). (3) Michael, Schulthess, J. prakt. Chem. (2) 43, 594-596 (1891).

[For prepn. of \bar{C} from o-chlorobenzyl alcohol [Beil. VI-444, VI₁-(222)] with PCl₅ (7) or with SOCl₂ + pyridine (5) see indic. refs.; from o-chlorotoluene (3:8245) with PbCl₄-2NH₄Cl (1) or with Cl₂ (8) (9) in ultra-violet light (4) see indic. refs.; from benzyl chloride (3:8535) with Cl₂ see (10).]

[For condens. of \tilde{C} with p-chlorophenol and use of prod. as anti-moth prepn. see (11); for use in prepn. of condensation prod. with sulfonated phenol see (12).]

[C with phenol in toluene yields (13) 2-(o-chlorobenzyl)phenol, b.p. 146-151° at 3 mm. (benzoate, b.p. 173-176° at 2.5 mm.), and o-chlorobenzyl phenyl ether, b.p. 140-145° at 2.5 mm.; C with 2,4-dichlorophenol (3:0560) in toluene yields 2-(o-chlorobenzyl)-4,6-dichlorophenol, m.p. 59.5-60.5° (benzoate, m.p. 81-82°), and o-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 61-62°.]

[C with phenol + AlCl₃ yields (13) 4-(o-chlorobenzyl)phenol, m.p. 68-69° (benzoate, m.p. 64.5-65.5°), and 2-(o-chlorobenzyl)phenol (see above); C with 2,6-dichlorophenol (3:1595) + AlCl₃ yields (13) 4-(o-chlorobenzyl)-2,6-dichlorophenol, m.p. 86.5-87.5° (benzoate, m.p. 86-87°).]

[C with Mg in 10 moles dry ether gives (60-75% yield (4)) cf. (25) o-Cl.C₆H₄.CH₂MgCl (particularly sensitive to air oxidn.); this with CO₂ followed by acidification or with methyl chloroformate (3:5075) followed by hydrolysis yields (4) o-chlorophenylacetic acid, m.p. 94-95° (3:2640); the R.MgCl cpd. with phenyl isocyanate as directed (22) for p-isomer should yield o-chlorophenylacetanilide [Beil. XII-275], m.p. 140° cor. (23), 138.5° (24), although this method has not been specifically reported for C; the RMgCl cpd. with HgCl₂ gives (25) o-chlorobenzyl HgCl, m.p. 111°, or with HgBr₂ gives (25) o-chlorobenzyl HgBr, m.p. 128°.]

[For study of behavior of \bar{C} with NaOEt see (14) (7); for study of rate of reaction of \bar{C} with LiI, NaI, or KI (6) (5) or with Na₂SO₃ (2) see indic. refs.; for study of acid hydrolysis of \bar{C} in various solvents see (5); for reaction of \bar{C} with KCN yielding o-chlorobenzyl cyanide (which on hydrolysis gives o-chlorophenylacetic acid (3:2640)) see (15) (16); for behavior of \bar{C} with cellulose (17) or sodium cellulose (18) see indic. refs.]

Č refluxed 4 hrs. with hexamethylenetetramine (1 mole) in 60% alc. soln. yields (19) o-chlorobenzaldehyde (3:6410) q.v.; Č htd. in xylene with p-nitrophenylhydrazine yields (20) o-chlorobenzal-p-nitrophenylhydrazone, m.p. 241° (20).

Č on mononitration with 1.2 pts. fumg. HNO₃ at 30-40° gives (35% yield (21)) 2-chloro-5-nitrobenzyl chloride, pr. from alc., m.p. 66° (21).

Oil, volatile with steam. — \tilde{C} often contains o-chlorobenzyl chloride (3:6400) as impurity (7). — \tilde{C} very easily oxidized in air (probable cause of variant constants). — \tilde{C} yields NaHSO₃ cpd. (15) (21).

[For prepn. of \bar{C} from o-chlorotoluene (3:8245) with MnO₂ + H₂SO₄ (8), or PbO₂ (24% yield (21)), or CrO₂Cl₂ in CCl₄ (9) or CS₂ (10), or via halogenation to o-chlorobenzal (di)chloride (3:6625) (5) (12) or o-chlorobenzal (di)bromide (11) and subsequent hydrolysis with fumg. H₂SO₄ (11) (12) (1) or anhydrous oxalic ac. (14) see indicated refs.; for prepn. from o-nitrobenzaldehyde via o-aminobenzaldehyde see (12); from o-chlorobenzyl alc. by dehydrogenation with CuO + dinitrobenzene in quinoline (86% yield) see (13); from o-chlorobenzyl chloride (3:6400) with hexamethylenetetramine see (2); from o-chlorobenzylamine with formalin + hexamethylenetetramine see (41); for other misc. methods see Beil. VII-233].

Č with CrO₃ (16) or KMnO₄ (2) oxidizes to o-chlorobenzoic acid (3:4150), m.p. 141°. [For study of auto-oxidn. see (17).] — Č on cat. hydrogenation gives (yield: 96% (18); 50% (19)) o-chlorobenzyl alc., m.p. 69° (19), 64–65° (18). — Č with conc. alk. undergoes Cannizzaro reactn. (for study on dioxane soln. see (20)) although presumable products, o-chlorobenzyl alc. and o-chlorobenzoic acid, have not (by this reactn.) actually been isolated.

Č with dil. alc. KCN for 4 hrs. at 60° gives (21% yield (22)) 2,2'-dichlorobenzoin, m.p. 63-64° (22). — Č with KCN + HCl yields o-chloromandelonitrile which on hydrolysis with HCl gives o-chloromandelic acid, m.p. 84-85° (23).

Č on htg. with NaOAc + Ac₂O for 8 hrs. at 180-200° undergoes Perkin reactn. giving (71% yield (12)) o-chlorocinnamic acid, m.p. 211° (12). [This with Br₂ in CHCl₃ gives (24) o-chlorocinnamic acid dibromide, m.p. 183° (24).] — Č + malonic acid + pyridine gives (38) alm. quant. yield of o-chlorocinnamic ac., m.p. 211-212° (31). [In absence of pyridine reactn. gives 93% yield o-chlorobenzalmalonic acid, m.p. 192° (37).]

C on mononitration as specified (25) gives 2-chloro-5-nitrobenzaldehyde, cryst. from

dil. AcOH, m.p. 78-79° (25), 80° (26). [Oxime, m.p. 147-148° (26); corresp. acid, 2-chloro-5-nitrobenzoic acid, m.p. 165° (25).]

Č in alc. warmed at 58-60° for 2 hrs. with (NH₄)₂CO₃ + KCN as directed (37) gives 5-(o-chlorophenyl)hydantoin, m.p. 175.7-176.1° cor. (37).

[Č with hydrazine sulfate gives (91-95% yield (40)) o-chlorobenzaldazine, m.p. 143.5° cor., but Č with hydrazine hydrate gives (84% yield (40)) o-chlorobenzaldehyde hydrazone m.p. 33-34°, b.p. 165-170° at 14 mm.; note that latter on Wolff-Kishner reduction gives (35-82% yield (40)) o-chlorotoluene (3:8245).]

- ① o-Chlorobenzaldoxime (anti form): pr. from alc., m.p. 75-76° (1) (27). [From Č + NH₂OH.HCl + Na₂CO₃ (1); the sym. isomer has m.p. 98-102° (28), 101-103° (7).]
- O-Chlorobenzaldehyde phenylhydrazone: m.p. 86° (29), 84° (39).
- O-Chlorobenzaldehyde p-nitrophenylhydrazone: or. pl., m.p. 249° (30) (31); br.-red. ndls., 241° (32); red ndls. from alc., 237–238° (13).
- © o-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone: or.-red. ndls. from xylene, m.p. 209° (33), 213.6° (34) 207° (41). [Use in detn. of C (11).]
- ① o-Chlorobenzaldehyde dimethone: ndls. from alc., m.p. 199° u.c., 205° cor. (35). [Corresp. anhydride, cryst. from alc., m.p. 224-226° cor. (35).]
- © o-Chlorobenzaldehyde semicarbazone: lfts. from MeOH, m.p. 229-230° (36), tbls. from pyridine, m.p. 225-226° (9), 226° (42).

3:6420 1,2,4-TRICHLOROBENZENE Cl
$$C_6H_3Cl_3$$
 Beil. V - 204 $V_{1-}(112)$ $V_{2-}(156)$

B.P. M.P. 213° cor. (1) (17) 17–18° (8)
$$D_{25}^{25} = 1.4634$$
 (15) 212.9–213° (2) 17° (7) (9) cf. (7) 212–213° (3) 16–17° (4) $n_{\rm D}^{25} = 1.5524$ (15) 211° cor. at 742 mm. (4) 16.6° (10) 210° (5) (6) 16.5° (11) (12) 206° (7) 16° (1) (3) (13) 14.5° (14)

For thermal anal. of mixts. of \bar{C} with 1,2,3-trichlorobenzene (3:0990) or with 1,3,5-trichlorobenzene (3:1400) see (10) (the cutectic of \bar{C} with the former conts. 71% \bar{C} and melts 2.7° (10)); for m.p./compn. data on ternary mixt. of \bar{C} with the other two isomers see (10).

[For use of C in mfg. of elec. insulating material see (16).]

[For prepn. of \bar{C} from 2,4-dichloroaniline [Beil. XII-621; \bar{X} II₁-(309)] (1) (11), from 2,5-dichloroaniline [Beil. XII-625, XII₁-(311)] (6), or 3,4-dichloroaniline [Beil. XII-626 XII₁-(311)] (1) via diazotization and use of Cu_2Cl_2 reaction see indic. refs.; from 4-chloro-1,3-diaminobenzene [Beil. XIII-53, XIII₁-(15)] via tetrazotization and use of Cu_2Cl_2 reaction (62% yield) see (17); from p-dichlorobenzene (3:0980) with S_2Cl_2 in SO_2Cl_2 + AlCl₃ (58% yield \bar{C}) see (3) (18).]

[For formn. of Č from 2,3,6-trichlorobenzaldehyde (3:2287) by KOH fusion (88% yield (4)) or from 2,3,6-trichloroacetophenone by KOH fusion (82% yield (14)) see indic. refs.; from 2,4-dichlorophenol (3 0560) by htg. 7 hrs. with PCl₅ (25.5% yield) see (1); from 2-nitro-1,4-dichlorobenzene or from 4-chloro-3-nitrobenzenesulfonic acid by htg. with SOCl₂ in s.t. 10 hrs. at 160-180° see (19) (20); from 2-chlorobenzene-1,4-disulfonyl chloride with PCl₅ in s.t. 4 hrs. at 210° see (8); from 2,4-dichlorobenzenesulfonyl chloride by htg. with SOCl₂ in s.t. at 180° see (21).]

[For formn. of $\bar{\rm C}$ (together with other products) from ${\rm C_6H_6}$ with ${\rm Cl_2}$ in pres. of ${\rm I_2}$ (7) or of Fe (22) see indic. refs.; from o-dichlorobenzene (3:6055) and/or p-dichlorobenzene (3:0980) with ${\rm Cl_2}$ under various conditions see (22) (23) (24) (25) (9); from m-dichlorobenzene (3:5960) with ${\rm Cl_2}$ under various conditions see (9) (13) (23); from chlorobenzene (3:7903) or p-dichlorobenzene (3:0980) by boilg. with ${\rm FeCl_3}$ see (26); from α -benzene-hexachloride (3:4410) on htg. above its m.p. (158°) (28) (21) or htd. with aq. in s.t. at 200° (27), or on boilg. with ${\rm MeOH/KOH}$ (10), ${\rm EtOH/KOH}$ (10) (28) (5) (22), alc. KCN (27), or pyridine (10), or on htg. with quinoline at 105–110° (10), see indic. refs.; from β -benzene-hexachloride (3:4990) q.v. on boilg. with alc. KOH see (10).]

[\bar{C} with Cl₂ in pres. of Al/Hg yields exclusively (23) 1,2,4,5-tetrachlorobenzene (3:4115), m.p. 135-136° (23); \bar{C} with liq. Cl₂ in s.t. at room temp. for 10 days gives (29) (30) a mixt. of addn. products.]

[Č with NaOMe in MeOH under various conditions (31) (32) (33) (11) (34) yields 2,5-dichlorophenol (3:1190), m.p. 57°; for behavior with EtOH/KOH see (38).]

 $\ddot{\mathbf{C}}$ on mononitration, e.g., by soln. of $\ddot{\mathbf{C}}$ (1 g.) in 5 ml. fumg. HNO₈ (D=1.49) (35), then pouring onto ice (35), gives 100% yield (35) (1) (5) (15) (39) 1,2,4-trichloro-5-nitrobenzene [Beil. V-246], pr. from alc., m.p. 58° (1), 57° (7) (15), 56° (35); this prod. with piperidine as directed (36) yields 1,2-dichloro-4-piperidino-5-nitrobenzene, red pr. from alc., m.p. 64-65° (36).

 \bar{C} on dinitration, e.g., by soln. of \bar{C} (1 g.) in 5 ml. fumg. HNO₃ (D=1.49) + 5 ml. conc. H₂SO₄ and subsequent refluxing for 1 hr., then pouring into aq. (35), gives (100% yield (35)) (7) (37) 1,2,4-trichloro-3,5-dinitrobenzene [Beil. V-266], pr. from alc., m.p. 103.5° (7), 102.5-103.5° (35) (37); this prod. (1 g.) htd. 1 hr. at 100° with 5 g. aniline as directed (35) yields 1-chloro-2,4-dianilino-3,5-dinitrobenzene, m.p. 182° (35).

Note that the trinitration prod. to be expected from complete nitration of C has not been reported.

[\bar{C} with chlorosulfonic acid as directed (35) yields 1,2,4-trichlorobenzenesulfonyl chloride, m.p. 31-34° (35) which with $(NH_4)_2CO_3$ yields 1,2,4-trichlorobenzenesulfonamide, m.p. above 200° (35).]

3:6425 HEXACHLOROBUTADIENE-1,3 Cl Cl C₄Cl₆ Beil. S.N. 12 $Cl_2C=C-C=CCl_2$

B.P. M.P. 215° (1)
$$-21$$
° (1) (2) $D_4^{20} = 1.6820$ (1) $n_D^{20} = 1.5542$ (1) 211° at 710 mm. (2) -19 ° (5)

[See also octachlorocyclopentene (3:0422).]

Colorless oily liq. with weak turpentine-like odor.

[For prepn. of Č from butadiene-1,3 (1) (3) or butane, butene, or their chloro substitution products (3) (4) with Cl₂; or from hexachlorobutene (itself obtd. from dimerization (5) (2) of trichloroethylene (3:5170)) by cat. addn. of Cl₂ followed by cat. removal of 2 HCl or vice versa (1) (2); or from acetylene with Cl₂ (6) (note that tetrachloroethylene (3:5460) is also formed).]

Č on reduction with Zn + alc. gives (1) butadiene-1,3 (corresp. tetrabromide, m.p. 117°). Č behaves as if saturated: e.g., Č does not add Cl₂ (even in sunlight) (1); Č does not (1) react with maleic anhydride or benzoquinone-1,4; Č does not (1) polymerize (even at 100 atm.).

Č is stable toward acids and alkalies and (unlike some other highly chlorinated unsaturates) does not give a carboxylic acid on treatment with conc. H₂SO₄ (1).

Note that a product of m.p. 38° and b.p. 283° formerly regarded as \bar{C} is now thought to be octachlorocyclopentene (3:0390).

3:6430 DICHLOROACETIC ACID ANHYDRIDE
$$C_4H_2O_3Cl_4$$
 Beil. II - 204 II_1 ... II_2 ... Cl_2CH ...

Note that the above name of C is so rendered to emphasize that it is the anhydride of dichloroacetic acid (not a dichlorinated acetic anhydride).

[For prepn. of \tilde{C} from dichloroacetyl chloride (3:5290) with Na \tilde{A} in POCl₃ in dry ether (1), or with Na \tilde{A} + AlCl₃ (4), or on boilg. with Na₂CO₃ (2) see indic. refs.; for formn. of \tilde{C} as by-product during reactn. of sodium dichloroacetate with acetyl chloride (3:7065) in dry ether see (3) (the other prod. is the mixed anhydride, acetic-dichloroacetic anhydride [Beil. II-204], b.p. 79-80° at 16 mm., $D_4^{20} = 1.5170$ (3).]

Č on hydrolysis with aq. yields dichloroactic acid (3:6208) q.v.; for the amide, anilide, p-toluidide, and other derivs. corresp. to Č see dichloroacetic acid (3:6208).

3:6430 (1) Anthoine, Jahresber. 1883, 1032. (2) Patterson, Ber. 38, 212-213 (1905). (3) Baroni, Gazz. chim. ital. 63, 30 (1933); Cent. 1933, I 3183; C.A. 27, 3447 (1933). (4) Strosacker, Schwegler (to Dow Chem. Co.), U.S. 1,713,104, May 14, 1929; Cent. 1929, II 1215; C.A. 23, 3234 (1929).

3:6445 m-CHLOROBENZYL CHLORIDE
$$C_7H_6Cl_2$$
 Beil. V — V_1 — V_2 —(231) B.P. 215-216° at 753 mm. (1) $D_4^{15} = 1.2695$ (1) 213-214° at 740 mm. (2) 111.0-111.2° at 25.4 mm. (3) 111-113° at 25 mm. (4) 110-111° at 25 mm. (5) 104° at 17 mm. (6)

[For prepn. from m-chlorobenzyl alc. [Beil. VI-444] with PCl₅ (1) or with SOCl₂ (yield: 87% (5), 78% (4)) see indic. refs.; from m-chlorotoluene (3:8275) with Cl₂ see (2) (3) (6) (7) (8) (9) see indic. refs.]

[Č with phenol in toluene yields (10) o-(m-chlorobenzyl)phenol, b.p. 192-194° at 14 mm. (benzoate, m.p. 67-67.4°), and m-chlorobenzyl phenyl ether, m.p. 36.0-36.4°; Č with 2,-4-dichlorophenol (3:0560) in toluene yields (10) 2-(m-chlorobenzyl)-4,6-dichlorophenol, m.p. 59.4-60.0° (benzoate, m.p. 63.5-64.0°, benzenesulfonate, m.p. 114.5-115.0°, p-toluenesulfonate, m.p. 125.4-126.0°), and m-chlorobenzyl 2,4-dichlorophenyl ether, m.p. 42-42.5°,

[Č with phenol + AlCl₃ yields (10) p-(m-chlorobenzyl)phenol, b.p. 145-148° at 3 mm. (benzoate, m.p. 57.5-58.0°); Č with 2,6-dichlorophenol (3:1595) yields (10) 4-(m-chlorobenzyl)-2,6-dichlorophenol, m.p. 79-80° (benzoate, m.p. 130-130.4°; p-toluenesulfonate, m.p. 104.5-105.0°).]

[C with Mg in dry ether yields (8) m-Cl.C₆H₄.CH₂Cl; this on treatment with CO₂ yields m-Cl.C₆H₄.CH₂.COOMgCl which on subsequent further treatment with various other RMgX cpds. undergoes abnormal reaction giving m-chlorophenylmalonic acid, m.p. 127–128° (8); the RMgCl cpd. with phenyl isocyanate as directed (13) for the p-isomer should yield m-chlorophenylacetanilide, m.p. 130° cor. (14), although this reaction has not been specifically reported for C.]

[For studies of rate of reaction of \tilde{C} with NaOEt see (1) (11) (5); with Na₂SO₃ see (4); with AlCl₃ + C₆H₆ see (12); for acid hydrolysis in acetone see (6); with KI in various solv. see (6); for reactn. of \tilde{C} with diethyl malonate see (2).]

3:6475
$$m$$
-CHLOROBENZALDEHYDE C_7H_6OCl Beil. VII - 234 VII_1 -(133)

Oil. — Volatile with steam. — C yields NaHSO₃ cpd.

[For prepn. of \bar{C} from *m*-nitrobenzaldehyde via reductn. with SnCl₂ to *m*-aminobenzaldehyde followed by diazotization and reactn. with CuCl (yield: 75-79% (4), 70-80% (3), 58-65% (7) (24) see indic. refs.; from *m*-chlorotoluene (3:8275) with CrO₂Cl₂ (44.5% yield) see (8); from *m*-chlorobenzyl alc. by oxidn. with HNO₃/H₂SO₄ see (9); for formn. (together with other products) during chlorination of benzaldehyde see (10); from *m*-chlorobenzylamine with formalin + hexamethylenetetramine see (25).]

 \tilde{C} is readily oxidized even by air (4); \tilde{C} with KMnO₄ yields m-chlorobenzoic acid (3:4392), m.p. 154°. [For study of auto-oxidn see (11).] — \tilde{C} with conc. NaOH undergoes Cannizzaro reactn. (for study in dioxane soln see (23)) although the presumable products, m-chlorobenzyl alc., b.p. 234°, and m-chlorobenzoic acid, m.p. 154°, have not (by this reactn.) actually been isolated.

Č with dil. alc. KCN at 60° for 5 hrs. in absence of air gives 22% yield of 3,3'-dichlorobenzoin, cryst. from lgr., m.p. 75-76° (12).

 \tilde{C} on htg. with NaOAc + Ac₂O for 8 hrs. at 180-200° undergoes Perkin reactn. giving (61.5% yield (13)) m-chlorocinnamic acid, m.p. 165° (13) (14). [This with Br₂ in CHCl₃ gives dibromide, m.p. 183° (15).] — \tilde{C} htd. with malonic acid + pyridine (24) gives alm. quant. yield (24) of m-chlorocinnamic acid, m.p. 163° (24). [In absence of pyridine reaction gives 100% yield m-chlorobenzalmalonic acid, m.p. 184-186° (24).]

Č on mononitration as specified (3) yields 3-chloro-6-nitrobenzaldehyde [Beil. VII-262], ndls. from dil. alc., m.p. 77.5° (3). [Oxime, tbls. from alc., m.p. 112° (3); phenylhydrazone, ndls. from alc., m.p. 180-181° (3).]

- m-Chlorobenzaldoxime (anti form): pr. from alc., m.p. 70-71° (2), 70° (16) (17). [From C + NH₂OH.HCl + Na₂CO₃ (2); the syn isomer (from the anti via ethereal HCl, then Na₂CO₃) has m.p. 115-116° rap. htg. (2), 118° (17).].
- ① m-Chlorobenzaldehyde phenyihydrazone: ndls. from abs. alc., m.p. 134-135° (3), 133-134° (18).
- m-Chlorobenzaldehyde p-nitrophenylhydrazone: cryst. from dil. AcOH, m.p. 216° (19), 214° (16). [For m.p./compn. data on mixt. of this deriv. with benzaldehyde p-nitrophenylhydrazone, m.p. 190°, see (16).]
- m-Chlorobenzaldehyde 2,4-dinitrophenylhydrazone: or.-yel. cryst., m.p. 256° (20), Bordeaux-red cryst. from xylene, m.p. 248° cor. (22), 245° (25). [Use in detn. of C (22).]
- m-Chlorobenzaldehyde semicarbazone: lfts. from MeOH (21) or pyridine (8), m.p. 230° (21), 228° (8). [This deriv. does not distinguish C from o- (3:6410) or p- (3:0765) isomers.]

CHAPTER XV

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 1. D_4^{20} greater than 1.1500

(3:6500-3:6999)

C₅H₆O₂Cl₂

Beil. II - 634

II1-(273)

[For prepn. of C from glutaric acid (1:0440) with PCl₅ (1) (2) (3) or with SOCl₂ (80-88% vield (4)) (5) see indic. refs.]

Note that C may react in either sym. or unsym. form (6).

3:6500 GLUTARYL (DI)CHLORIDE

 $[\bar{C} \text{ with AlCl}_3 + C_6H_6 \text{ yields (7) (4) 1,5-diphenylpentanedione-1,5 (1,3-dibenzoylpropane)}$ [Beil. VII-775, VII₁-(403)], m.p. $62-63^{\circ}$ (7) (4); \bar{C} with AlCl₃ + m-xylene gives (8) 1,5di-m-xylylpentanedione-1,5, m.p. 60° (8), $+ \gamma$ -(m-xyloyl)-n-butyric acid, m.p. 118° (8); Č with AlCl₃ + mesitylene gives (72% yield (5)) 1,5-dimesitylpentanedione-1,5, m.p. 133-134° (5).]

 \tilde{C} on hydrolysis yields glutaric acid (1:0440), m.p. 98° (for the diamide, dianilide, di-ptoluidide, and other derivs. corresp. to \bar{C} see 1:0440).

3:6500 (1) Reboul, Ann. chim. (5) 14, 504 (1878). (2) von Auwers, Schmidt, Ber. 46, 479 (1913). (3) Meerburg, Rec. trav. chim. 18, 373 (1899). (4) Skraup, Guggenheimer, Ber. 58, 2493 (1925). (5) Kao, J. Chinese Chem. Soc. 3, 56-59 (1935). (6) Plant, Tomlinson, J. Chem. Soc. 1935, 856. (7) Auger, Ann. chim. (6) 22, 358 (1891). (8) Borsche, Ber. 52, 2080 (1919).

3:6510 \(\beta\)-CHLOROETHYL TRICHLOROACETATE C₄H₄O₂Cl₄ Beil. II - 209 Cl.CH₂.CH₂.O.CO.CCl_a II1---II.

B.P. 217° at 766 mm. (1)
$$D_4^{20} = 1.5357$$
 (1), cf. (4) 99.5–100.0° at 14 mm. (2) $n_D^{20} = 1.48133$ (1) cf. (4) 95–96° at 11 mm. (3) 68–69° at 1.6 mm. (4)

[For prepn. (45% yield (3)) from ethylene chlorohydrin (3:5552) + trichloroacetyl chloride (3:5420) + pyridine in ether see (3) (1); for prepn. (70% yield (3)) from Bhydroxyethyl trichloroacetate (3:9099) + SOCl₂ see (3).]

 \tilde{C} on shaking with aq. is smoothly saponified to β -chloroethanol (3:5552) + trichloroacetic ac. (3:1150), no chloride ion being formed (3).

3:6510 (1) Delacre, Bull. soc. chim. (2) 48, 708 (1887). (2) Palomaa, Salmi, Korte, Ber. 72, 797 (1939). (3) Meerwein, Sönke, Ber. 64, 2380 (1931). (4) Meerwein, Sönke, J. prakt. Chem. (2) 137, 309 (1933).

3:6517
$$\beta$$
-CHLORO- β' -HYDROXY-ISOPROPYL ACETATE $C_5H_9O_3Cl$ Beil. II - 142 (Glycerol α -chlorohydrin β -acetate; CH $_2Cl$ II₁-(67) β -aceto- α -chlorohydrin; H—C—O.CO.CH $_3$ CH $_2OH$

B.P. 218° (1) at 760 mm. (2) 108° at 12 mm. (3)

[See also glycerol α -chlorohydrin α' -acetate (3:6775).]

[For formn. of \bar{C} from 3-hydroxy-1,2-epoxypropane (glycidol) with AcCl (3:7065) (γ -hydroxy- β -chloro-n-propyl acetate is also formed) see (1); from epichlorohydrin (3:5358) with AcOH in s.t. at 180° see (1); from glycerol α , β -diacetate with PCl₅ see (3).]

Note that the homogeneity of all reported prepns. of $\bar{\mathbf{C}}$ is probably open to serious question.

3:6517 (1) Bigot, Ann. chim. (6) 22, 489-491 (1891). (2) Gibson, J. Soc. Chem. Ind. 59, 950 (1931). (3) Wegscheider, Zmerzlikar, Monatsh. 34, 1079-1080 (1913).

B.P. 218-219°

M.P. 53-54°

See 3:0990. Division A: Solids.

B.P. 219-220° at 740 mm.

M.P. 67°

See 3:1595. Division A: Solids.

B.P. 218.5° (1) $D_4^{34} = 1.7131$ (1) $n_D^{18} = 1.5262$ (1)

[For prepn. of \tilde{C} from 1,2,3,3-tetrachloropropene-1 (3:5920) + Cl_2 in sunlight at -30° see (1).] [The product obtd. by (4) from sym.-tetrachloroacetone (3:6050) + PCl_5 was probably very impure \tilde{C} .]

Č with alc. KOH loses HCl quant. yielding 1,1,2,3,3-pentachloropropene-1 (3:6075), b.p. 183° (1).

[For use as solvent for cellulose esters see (2) (3).]

3:6525 (1) Prins, J. prakt. Chem. (2) 89, 422 (1914). (2) Spicers, Ltd. & Hands, Brit. 279,139, April 21, 1926; Cent. 1928, I 770, C.A. 22, 2840 (1928). (3) Spicers, Ltd. & Hands, French 625,165, Aug. 4, 1927; Cent. 1928, I 770. (4) Levy, Curchod, Ann. 252, 335-338 (1889).

3:6535 m-TOLUYL CHLORIDE
$$C_8H_7OCl$$
 Beil. IX - 477 CH_3 CH_3 CH_3 CH_3 CH_7OCl CH_7OCl CH_8 CH_8

B.P.			M.P.	
219-220°	at 773 m	n. (1)	-25° (4)	$D_4^{20} = 1.173 (3)$
218.7-219.7°	at 760 m	n. (2)	-23° (1)	-
218°	at 724 m	n. (1)		
120°	at 38 m	n. (3)		
119-120°	at 36 m	n. (4)		
[136-138°	at 31 m	n. (5)]		
105°	at 20 mm	n. (6)		
109°	at 15 m	n. (7)		
109°	at 8 mm	n. (8)		
71.2°	at 4 m	n. (9)		

[For prepn. of \bar{C} from m-toluic acid (1:0705) with PCl₅ (83% yield (1)) (2) (10), with PCl₅ in CHCl₃ (70% yield (3)) (5), with PCl₃ (8), with SOCl₂ (95% yield (11)) (12) (6) (9), or with POCl₃ + NaCl (or KCl) (13) see indic. refs.; for formn. of \bar{C} from heptadiyne-1,6-carboxylic acid-4 (pseudo-m-toluic acid) with PCl₅ see (14).]

C with pyridine and excess K₂S₂O₅ yields (15) m-toluic anhydride, m.p. 70-71°.

[For reactn. of \bar{C} with AlCl₃ and various hydrocarbons to yield corresp. ketones, e.g., with C_6H_6 yielding (10) phenyl *m*-tolyl ketone [Beil. VII-440, VII₁-(235)], with toluene yielding (16) *m*-tolyl *p*-tolyl ketone [Beil. VII-451], with *m*-xylene yielding (17) *m*-tolyl *m*-xylyl ketone, see indic. refs.; note, however, that \bar{C} on htg. with AlCl₃ alone at 130-140° gives (17) (44-46% yield (18)) 2,6-dimethylanthraquinone [Beil. VII-815], m.p. 236°]

[\bar{C} with MeZnI (19) or Zn(CH₃)₂ (3) or MeMgBr + CdCl₂ (20) gives (yield: 83% (20), 43% (19)) *m*-methylacetophenone (1:5527), b.p. 220°.]

[$\bar{\mathbf{C}}$ with Cl₂ at 160-180° gives (90% yield (21)) (6) m-(chloromethyl)benzoyl chloride (ω -chloro-m-toluyl chloride), b.p. 149-150° at 20 mm. (21); $\bar{\mathbf{C}}$ with Br₂ at 185-195° gives (50% yield (22)) ω -bromo-m-toluyl bromide, b.p. 167° at 22 mm. (22).]

[Č with MeOH yields methyl m-toluate (1:3781), b.p. 221°; Č with EtOH yields ethyl m-toluate (1:3942), b.p. 234°; for study of rate of reactn. see {4}.]

 \bar{C} on hydrolysis yields *m*-toluic acid (1:0705), m.p. 110-111° (for study of rate see (23)). — For the amide, anilide, *p*-toluidide, and other derivs. corresp. to \bar{C} see *m*-toluic acid (1:0705).

3:6540 BENZOTRICHLORIDE (Phenylchloroform,
$$\omega, \omega, \omega$$
-trichlorotoluene) CCl₃ C₇H₅Cl₃ Beil. V - 300 V₁-(152) V₂-(233) B.P. F.P. 220.5-221.5° (1) -4.4° (8) $D_4^{20} = 1.3741$ (8) 220.9° (2) -4.75° (3) 1.37563 (4) 220.7° at 761 mm. (3) -5.0° (9) (10) $n_D^{20} = 1.55789$ (8) 214-216° (4) -8.1° (7) 1.5579 (4) 213.0-213.5° (5) 1.55726 (11) 129° at 60 mm. (6) 105° at 25 mm. (7) 110.7° at 23 mm. (3) 89.0-89.5° at 10 mm. (8)

Colorless liquid insol. aq., sol. many org. solvents. — Ord. samples of \bar{C} may also cont. benzal (di)chloride (3:6327) or even benzyl chloride (3:8535). — \bar{C} when pure is stable in dry air, but ord. material (contg. dislvd. HCl) hydrolyzes rapidly in moist air (3). — The very high value (93) of molal f.p. lowering of \bar{C} prob. accounts for difficulty of earlier workers in attaining high f.p. values (3). — For removal of dislvd. HCl from \bar{C} by treat. with PbCO₃ see (9). — For purification of \bar{C} via crystallization see (10); for comml. purification see (12).

 $\bar{\mathbf{C}}$ forms const.-boilg. mixts. with various cpds., e.g., $\bar{\mathbf{C}}$ with *p*-dibromobenzene (b.p. 220.25°) forms an azeotrope, b.p. 219.6° at 760 mm., contg. 28 wt. % $\bar{\mathbf{C}}$ (2); $\bar{\mathbf{C}}$ with nitrobenzene (b.p. 210.75°) forms an azeotrope, b.p. 210.72° at 760 mm., contg. 1.5 wt. % $\bar{\mathbf{C}}$ (2); $\bar{\mathbf{C}}$ with *o*-nitrotoluene (b.p. 221.85°) forms an azeotrope, b.p. 219.55° at 760 mm., contg. 75.5 wt. % $\bar{\mathbf{C}}$ (13); $\bar{\mathbf{C}}$ with methyl salicylate (1:1750) (b.p. 222.35°) forms an azeotrope, b.p. 220.75° at 760 mm., contg. 97 wt. % $\bar{\mathbf{C}}$ (13).

 \tilde{C} is impt. intermediate in prepn. of benzoic acid (see below under hydrolysis), in prepn. of certain dyestuffs (see below), and in prepn. of acyl halides and anhydrides (see below); for use in prepn. of films of cellulose ethers see (14).

[For prepn. of \bar{C} from toluene with Cl₂ especially in pres. of light and/or other catalysts see (15) (16) (17) (18); with Cl₂ in pres. of PCl₃ (3) cf. (19); with SOCl₂ in s.t. at 220° for 18 hrs. (20) or at 230-250° (21) see indic. refs.; with NOCl at 350° see (22); for formn. of \bar{C} from benzal (di)chloride (3:6327) with Cl₂ (23) or with NOCl at 150° (24) see indic. refs.; from benzyl chloride (3:8535) by htg. with PbCl₄.2NH₄Cl see (25); from benzoyl chloride (3:6240) with PCl₅ see (26); from benzotrifluoride + acetyl chloride + AlCl₃ as directed see (8); from benzyl ethers with PCl₅ see (27).]

 $[\bar{C}]$ on reductn. in alc. soln. with H_2 in pres. of colloidal Pd (28) or Pd/CaCO₃ (29) reacts bimolecularly giving (75% yield (28)) tolane tetrachloride (diphenylacetylene tetrachloride) (3:4496), colorless cryst. from AcOH, m.p. 162–163° (28), also obtd. from \bar{C} by other treatments (see below); this prod. with $H_2 + Pd/CaCO_3$ in alc. KOH is further reduced yielding (29) dibenzyl (1:7149) (use in quant. detn. of its halogen (29)). — \bar{C} with hydra-

zine hydrate in MeOH/KOH in pres. of Pd/CaCO₃ refluxed for $1\frac{1}{2}$ hrs. gives (42% yield (30)) a mixt. of the two geom. isomeric tolane dichlorides consisting mainly of the α -isomer (3:4210), colorless tbls. from alc., m.p. 148° (30), with a little of the β -isomer (3:1380), m.p. 61° (30); despite their unsaturation these prods. reduce further only with difficulty.

[Č satd. with Cl₂ and stood in sunlight for 8 months or Č with liq. Cl₂ in sunlight for a few days adds 3 Cl₂ yielding (31) 1,2,3,4,5,6-hexachloro-1 (trichloromethyl) cyclohexane, cryst. from CHCl₃ or by sublimation, m.p. 103° (31); this may be accompanied by a little pentachlorotrichloromethylcyclohexene, m.p. 132-134° (31). — Č with Cl₂ in pres. of I₂ yields (32) a mixt. of mono- and di-chlorobenzotrichlorides.]

[Č on pyrogenic decompn. over Pt at red heat yields (32a) cf. (34) tolane tetrachloride (3:4496) together with its isomorphous mixt. with α -tolane dichloride (see above). — \tilde{C} with Na in liq. NH₃ yields (33) 5% dibenzyl (1:7149) accompanied by much nitrogenous tar. — \tilde{C} with Zn in ether soln. reacts vigorously yielding (35) a deep green soln. contg. tolane dichloride (see above). — \tilde{C} with equal wt. reduced Cu at 100° for 10 hrs. yields (36) tolane tetrachloride, m.p. 162° (3:4496); note that distn. of crude reactn. prod. leads to further reactn. and formation (36) (37) of α - and β -tolane dichlorides (see above). — \tilde{C} with C₆H₆ in pres. of powdered chromium metal at 100° for 5 hrs. gives (17% yield (38)) triphenylchloromethane (3:3410), m.p. 106° (38). — \tilde{C} with small proportion of AlCl₃ (0.1 mole) at 50-60° evolves HCl and gives a mixt. (39) contg. 40% α , α -dichloro-m-trichloromethyl-diphenylmethane, m.p. 59-61°, + 10% m-(α ', α '-dichloro-m'-trichloromethylbenzyl)- α , α -dichlorodiphenylmethane, oil, + 34% unchanged \tilde{C} . — \tilde{C} with AlCl₃ in C₆H₆ (39) or \tilde{C} with Al + HgCl₂ in C₆H₆ (40) gives (62% yield (39)) 9,9',10,10'-tetraphenyl-9,10-dihydroanthracene, cryst. from acetone or lgr., m.p. 159° (40), 157-158° (39).]

[Č with MeMgCl in ether gives two types of reactn. according to concn. (41); e.g., Č with dilute MeMgCl yields tolane tetrachloride (3:4496) + ethane + MgCl₂, while Č with conc. MeMgCl gives in 22% yield a mixt. of the two geom. isomers of tolane dichloride (see above) consisting of 5 pts. of the trans form (3:4210), m.p. 138-139° (41), together with 1 pt. of the cis form (3:1380), m.p. 63° (41), separable by fractional crystn. from alc. — For reactn. of Č with EtMgBr see (42). — Č does not (43) react with excess mercury di-p-tolyl.]

[\bar{C} with HF gas in Cu flask at 0° for 72 hrs. (44), or \bar{C} with SbF₃ (45) (46), or \bar{C} with SbF₃.2NaF at 130-140° (47), gives (yields: 75-95% (44), 75% (45), benzotrifluoride, b.p. 102.3°, m.p. -29° . — Note that \bar{C} with ZnF₂ in Cu flask at 120° for 6 hrs. gives (65% yield (57)) benzoyl fluoride, b.p. 155-156° (57), also that \bar{C} + KF in HCOOH gives (16% yield (68)) formyl fluoride, b.p. -26° at 750 mm. (68).]

 \bar{C} on complete hydrolysis yields benzoic acid (1:0715): e.g., \bar{C} on htg. with anhydrous HCOOH yields (48) BzOH + CO + HCl (use in detn. of side-chain halogen (49)); \bar{C} with aq. in s.t. at 150° (15) or with aq. at 90-95° in pres. of Fe salts (50), or with aq. vapor at 550-850° over cat. (51), or with aq. + ZnCl₂ at 110-115° under press. (52), or with aq. CaCO₃ at 90° followed by acidif. with minl. acid (53) yields BzOH; note, however, although \bar{C} in ether soln. is only slowly hydrolyzed by aq. at room temp. (54) yet \bar{C} adequately shaken with aq. at room temp. is completely hydrolyzed (use in detn. of \bar{C} + benzal (di-chloride + benzyl chloride by titration with std. alk. using thymolsulfonphthalein (55)) and \bar{C} if subjected to actn. of steam (as in steam distn. of mixt. with volatile cpds.) is partially hydrolyzed (8). — [For study of kinetics of hydrolysis of \bar{C} in aq. acetone at 30° in pres. of acids, bases, or salts see (1).]

[\tilde{C} on partial hydrolysis yields benzoyl chloride (3:6240): e.g., \tilde{C} with limited amt. aq. in pres. of H₂SO₄ or FeCl₃ (56), or \tilde{C} with ord. comml. ZnCl₂ at 120° (57) (58), or \tilde{C} with aq. vapor over tin phosphate at 240° (59), or \tilde{C} with pure ZnO at 100° (57), or \tilde{C} with benzoic

acid in boilg. nitrobenzene (60), yields BzCl; note, however, that C with pure ZnCl₂ fails to react but addn. of 1 mole aq. or initial use of tech. ZnCl₂ gives BzCl (57).]

[Č htd. with carboxylic acids or anhydrides especially in pres. of ZnCl₂ is often used to prepare a mixture of benzoyl chloride with the acid chloride of the acid employed, particularly in cases where the two acyl chlorides are readily separable: e.g., Č with phthalic anhydride (1:0725) (61) (62) or phthalic acid (1:0820) (62) + ZnCl₂ at 110-120° or above gives 96% yield BzCl (3:6240) + 93% sym.-phthalyl (di)chloride (3:6900); for other examples see under chloroacetyl chloride (3:5235), dichloroacetyl chloride (3:5290), trichloroacetyl chloride (3:5420), fumaryl (di)chloride (3:5875), and terephthalyl (di)chloride (3:2205). — Similarly Č with salts of sulfonic acids yields BzCl + the corresp. sulfonyl chloride: e.g., Č + sodium β-naphthalenesulfonate gives (63) 90% yield BzCl + 80% yield β-naphthalenesulfonyl chloride.]

[C under certain conditions may be converted to benzoic anhydride (1:0595): e.g., C with BzOH + trace Fe salts htd. 6 hrs. at 110-115° under reflux (64), or C with NaOBz (65), or C with ord. conc. H₂SO₄ (66), or C in AcOH in pres. of phosgene (67), yields Bz₂O₋]

 \bar{C} very readily undergoes alcoholysis: e.g., \bar{C} with EtOH in pres. of ZnCl₂ yields (69) ethyl benzoate (1:3721); note, however, that \bar{C} + abs. EtOH in s.t. at 130-140° (70) or \bar{C} + trace sublimed FeCl₃ treated at 80-110° with 95% alc. (71) yields benzoyl chloride (3:6240) + ethyl chloride (3:7015); furthermore that \bar{C} + ethyl acetate (2 moles) in pres. of ZnCl₂ yields (69) ethyl benzoate (1:3721) + acetyl chloride (3:7065) + ethyl chloride (3:7015).

C reacts with phenols to give various products according to circumstances: C with aq. (72) (74) or better alc. (73) sodium phenolate (3 moles) gives at 100° small yields of phenyl benzoate (1:2257), m.p. 71°, and of o-hydroxybenzophenone (1:1414), m.p. 41°, together with other prods. notably benzaurin (see below). — C with phenol in pres. of ZnO gives (75) phenyl benzoate (see above) + p-hydroxybenzophenone (1:1560), m.p. 134°. — C with phenol (2 moles) htd. at 100° and reactn. prod. treated with steam yields (76) (77) 4,4'-dihydroxytriphenylcarbinol (=phenolbenzein=4'-hydroxyfuchsone=bcnzaurin) [Beil. VI-1145, VIII₁-(589)], as red crystn. powder (diacetate, m.p. 119° (76) (77); dibenzoate, m.p. 183-184° (76)), accompanied by p-hydroxybenzophenone (see above). — [For corresp. reactns. of C with o-crosol (1:1400) yielding o-crosolbenzein (78) (79), with thymol (1:1430) yielding thymolbenzein (80), with resorcinol (1:1530) yielding resorcinolbenzein (76), or with pyrogallol (1:1555) yielding pyrogallolbenzein (81) see indic. refs. - For reactn. of \tilde{C} with α -naphthol (1:1500) (73) (94) (95) (or with 1-hydroxynaphthoic acid-2 (82) (83) (95)) yielding 4-(1-hydroxynaphthyl) phenyl ketone (or the corresp. 4-(1-hydroxy-2carboxynaphthyl) phenyl ketones) respectively see indic. refs.; for reactn. of \bar{C} with β naphthol (1:1540) see (84).]

Č with ammonia or amines gives varied reactns. — Č with liq. NH₃ (85) or with NH₄Cl in s.t. at 200° (86) gives (75% yield (85)) benzonitrile; Č with conc. aq. NH₄OH in s.t. at 130° yields (85) benzoic acid + benzamide + benzonitrile. — Č (1 mole) with aniline (2 moles) warmed together without solvent or with ZnCl₂ in AcOH soln. gives (87) N,N'-diphenylbenzamidine hydrochloride [Beil. XII-273, XII₁-(202)], the free base of which has m.p. 147°; note, however, that Č with aniline hydrochloride + nitrobenzene + Fe filings htd. at 180° for 3-4 hrs. yields (87) the dyestuff Doebner's Violet (the HCl reactn. prod. of 4,4'-diaminotriphenylcarbinol) [Beil. XIII-742, XIII₁-(293)]. — Č (1 mole) with dimethylaniline (2 moles) htd. at 100° preferably in pres. of ZnCl₂ yields (86) the dyestuff Malachite Green (the HCl reactn. prod. of 4,4'-dimethylaminotriphenylcarbinol) [Beil. XIII-743, XIII₁-(293)] (see ⊕ below); analogous dyestuffs from other tertiary amines cannot be discussed here.

[Č with excess phenylhydrazine in alc. does not react until Cu powder is added; the

solution then (89) rapidly turns or.-red. and on cooling soon ppts. a mixture of benzaldehydephenylhydrazone, m.p. 157° (see 1:0195) (doubtless accounted for by reductn. of $\bar{\mathbf{C}}$ to benzal (di)chloride (3:6327) at the expense of phenylhydrazine), together with phenylhydrazine hydrochloride. — $\bar{\mathbf{C}}$ + excess phenylhydrazine heated in alc. without Cu (89) turns dark red and ppts. a mixt. of "formazylbenzene" [Beil. XVI-17], red lfts. from alc., m.p. 173° (doubtless accounted for as above), and phenylhydrazine hydrochloride.]

[C with amides or ammonium salts gives on htg. mixtures of corresp. nitriles and acid halides: e.g., C with benzamide at 140° yields (90) benzonitrile + benzoyl chloride; C with p-toluamide at 140° yields (90) benzonitrile, p-toluntrile, benzoyl chloride, and p-toluyl chloride (3:6600). — For patents exemplifying this type of reactn. see (91) (92).]

 \bar{C} on mononitration, e.g., with 0.44 pt. fumg. HNO₃ + 0.44 pt. conc. H₂SO₄ at 25–30° for ½ hr. (4), gives 85% yield *m*-nitrobenzoic acid, m.p. 140° (4); very possibly hydrolysis here precedes nitration since \bar{C} on nitration with N₂O₅ in cold CCl₄ gives (32) (93) an oily mixt. of nitrobenzotrichlorides more stable to hydrolysis than original \bar{C} , but which on cleavage with alk. or conc. H₂SO₄ yields a mixt. of nitrobenzoic acids containing 70% *m*-nitrobenzoic acid (for other studies of nitration of \bar{C} see (5) (10)). — \bar{C} on dinitration by soln. in 5.4 pts. conc. H₂SO₄ and treatment with 6.8 pts. fumg. HNO₃ at 185° for 1 hr. gives (4) 33% yield of 3,5-dinitrobenzoic acid, m.p. 203–204° (4).

[Č cannot be sulfonated without hydrolysis of the —CCl₃ group; \bar{C} with conc. H₂SO₄ even at 30° yields (66) benzoic acid (or its anhydride). — However, \bar{C} with gaseous SO₃ at room temp. (6) gives on subsequent vac. distn. an oil (perhaps *m*-sulfobenzotrichloride) which with aq. yields *m*-sulfobenzoic acid [Beil. XI-384, XI₁-(98)], dihydrate, m.p. 97-98°, losing aq. at 160° yielding anhydrous acid, m.p. 140-141° (6).]

- Malachite Green formation. C

 (1 drop) + dimethylaniline (1 drop) warmed with 0.1 g. fused ZnCl₂ gives intense green color.
- Benzoic acid: C on refluxing with aq. NaOH soln., subsequently acidified, ppts. benzoic acid (1:0715), m.p. 121°.

[For prepn. of \tilde{C} from p-chlorobenzoic acid (3:4940) with PCl₅ (80% yield (10)) (2) (13) (14), with SOCl₂ (11) (14) (6) (33), with SOCl₂ + AlCl₃ (15), or with p-chlorobenzotrichloride (3:6825) + ZnCl₂ (16) cf. (18) see indic. refs.; from NaĀ with oxalyl dichloride (3:5060) see (17); from p-toluenesulfonyl chloride with SOCl₂ in s.t. at 240° (95% yield) see (12); for formn. of \tilde{C} (2%) from benzoyl chloride (3:6240) with Cl₂ + FeCl₃ (together with 83.5% m- (3:6590) and 14.5% o- (3:6640) isomers see (3).]

 \bar{C} with MeOH yields (4) methyl p-chlorobenzoate (3:0535), m.p. 43°; \bar{C} with EtOH yields ethyl p-chlorobenzoate (3:6750), b.p. 238° (for study of rate of alcoholysis see (19) (20)); \bar{C} with isopropyl alc. yields isopropyl p-chlorobenzoate (for study of rate of reactn. see (21)).

 \bar{C} with Na \bar{A} (50% yield (22)) or \bar{C} with oxalyl dichloride (3:5060) in C_6H_6 (23) gives p-chlorobenzoic acid anhydride, ndls. from C_6H_6 or dil. acetone, m.p. 194.8° (22), 193–194° (23) (24). [This anhydride may form during various reactns. of \bar{C} espec. in pres. of terbases or Na₂CO₃.]

[For reactn. of \bar{C} with AlCl₃ + benzene yielding (25) p-chlorobenzophenone (3:1914), with AlCl₃ + toluene yielding (26) 4-chloro-4-methylbenzophenone, with AlCl₃ + biphenyl yielding (5) p-chlorophenyl p-xenyl ketone, with AlCl₃ + naphthalene yielding (27) p-chlorophenyl α -naphthyl ketone; with AlCl₃ + chlorobenzene yielding (9) 4,4'-dichlorobenzophenone (3:4270), with AlCl₃ + anisole yielding (6) (28) 4-chloro-4'-methoxybenzophenone, with AlCl₃ + phenetole yielding 4-chloro-4'-ethoxybenzophenone see indic. refs.]

[For reactn. of C with perylenetetracarboxylic acid diimide yielding vat dyes see (30); with 4,10-dichloroperylene + AlCl₃ see (31).]

[For reactn. of \tilde{C} with alk. H_2O_2 in acetone giving 4,4'-dichlorodibenzoyl peroxide, m.p. $137-138^\circ$ dec., see (32).]

 $\bar{\mathbf{C}}$ on hydrolysis yields p-chlorobenzoic acid (3:4940); for the amide, anilide, p-toluidide, and other derivs. corresp. to $\bar{\mathbf{C}}$ see p-chlorobenzoic acid (3:4940).

3:6600 p-TOLUYL CHLORIDE
$$C_8H_7OCl$$
 Beil. IX - 486 (p-Methylbenzoyl chloride) CH_3 $C=O$ Cl Cl

[For prepn. of \bar{C} from p-toluic acid (1:0795) with PCl₅ (100% yield (3)) (6) (10), with PCl₃ (11), with SOCl₂ (95% yield (12)) (2) (7) (13) (14), with POCl₃ + NaCl (KCl) (15) see indic. refs.]

[\bar{C} with pyridine and excess $K_2S_2O_5$ yields (16) p-toluic anhydride, m.p. 94° (also formed as by-product of prepn. of \bar{C} with PCl_5 (6)).]

[For reactn. of \bar{C} with AlCl₃ and various hydrocarbons to yield ketones, e.g., with C_6H_6 yielding (3) phenyl p-tolyl ketone (1:5160), with toluene yielding (17) di-p-tolyl ketone (1:5185), with biphenyl yielding (18) (13) p-tolyl p'-xenyl ketone, with naphthalene yielding (19) α -naphthyl p-tolyl ketone, with m-xylene yielding (14) p-tolyl m-xylyl ketone, with p-xylene yielding (14) p-tolyl p-xylyl ketone, with isopropylbenzene (cumene) yielding (20) p-cumyl p-tolyl ketone see indic. refs.]

 $[\tilde{\mathbf{C}}$ with EtZnI yields (21) ethyl p-tolyl ketone [Beil. VII-317, VII₁-(170)], b.p. 238°.]

 $[\bar{C}]$ with Cl_2 at elevated temp. yields (22) p-(chloromethyl)benzoyl chloride (a-chloro-p-toluyl chloride, b.p. 150–155° at 22 mm. (22); \bar{C} with Br_2 at 185–190° yields (23) a mixt. of p-(bromomethyl)benzoyl chloride, b.p. 155–156° at 20 mm., and p-(bromomethyl)benzoyl bromide, b.p. 170–171° at 20 mm., m.p. 56° (23).]

[C with MeOH yields methyl p-toluate (1:2071), m.p. 33°, b.p. 222.5°; C with EtOH yields ethyl p-toluate (1:3947), b.p. 234.5°; for study of rate of reactn. with MeOH see (24), with EtOH see (9), with isopropyl alc. see (25).]

 $\tilde{\mathbf{C}}$ on hydrolysis yields p-toluic acid (1:0795), m.p. 178°; for the amide, anilide, p-toluidide, and other derivs. corresp. to $\tilde{\mathbf{C}}$ see p-toluic acid (1:0795).

3:6625 o-CHLOROBENZAL (DI)CHLORIDE
$$C_7H_5Cl_3$$
 Beil. V - 300 (o-Chlorobenzylidene (di)chloride) $CHCl_2$ V_1 V_2 B.P. 228.5° (1) $D_{15}^{15} = 1.399$ (1) $n_D^{16} = 1.5670$ (4) 227-230° (2) 226-228° at 745 mm. (3) 100° at 10 mm. (3)

[For prepn. of \bar{C} from o-chlorobenzaldehyde (3:6410) with PCl₅ (86% yield (3)) (5) see indic. refs.; from o-toluenesulfonyl chloride with Cl₂ at 92° (73.5% yield (4)) or at 150–200° (6) see indic. refs.; from o-chlorotoluene (3:8245) with Cl₂ (1) in pres. of PCl₅ at 150–180° (7) or in pres. of PCl₅ at 102–105° (8) see indic. refs.; from o-hydroxybenzaldehyde (salicylaldehyde) (1:0205) with PCl₅ see (2); for formn. of \bar{C} (5–7%) from benzal dichloride (3:6327) with Cl₂ in pres. of I₂ (accompanied by 43% m- and 46–47% p-isomers) see (9).]

[For use of \bar{C} in prepn. of triphenylmethane dyes see (10) (11); for condensation with isoviolanthrone in prepn. of vat dyes see (12).]

Č on boilg. with water for 20 hrs. (3) or on htg. with aq. in s.t. at 170° (2) or with weakly fumg. H₂SO₄ at ord. temp. as directed (7) yields o-chlorobenzaldehyde (3:6410). [For studies of this hydrolysis under various other conditions see (13) (5).]

C on oxidn. with CrO₃ (2), or C on boilg. with aq. for 20 hrs. followed by treatment with cold conc. aq. KMnO₄ (3), gives (75% yield (3)) o-chlorobenzoic acid (3:4150), m.p. 141° (3).

[C in MeOH treated with molecular Ag + sand and htd. in s.t. for 6 hrs. at 95° yields (1) α,β -dichloro- α,β -bis-(o-chlorophenyl)ethane [Beil. V-601], cryst. from ether + lgr., m.p. 170.5° (1).]

C₈H₇O₂Cl

Beil. IX - 336

[For prepn. of \bar{C} from o-chlorobenzoic acid (3:4150) with MeOH + HCl (2) or MeOH + H₂SO₄ (2) (5) or MeOH + BF₃.Et₂O (70.6% yield (4)) see indic. refs.; from o-chlorobenzoyl chloride (3:6640) with MeOH see (1).]

 \tilde{C} on htg. with sirupy H_3PO_4 at 200° yields (6) o-chlorobenzoic acid (3:4150), chlorobenzene (3:7903), dimethyl ether $+ CO_2$.

Č added to 5-6 pts. very conc. HNO₃ at 0°, poured onto ice, yields (1) mainly methyl 2-chloro-5-nitrobenzoate [Beil. IX-403], ndls. from MeOH, m.p. 73° (1).

[C with Na + methyl acetate condenses giving (65-70% yield (5)) methyl o-chlorobenzoylacetate, b.p. 170-172° at 12 mm. (5); this prod. with excess phenylhydrazine in alc. + AcOH gives on htg. 3-(o-chlorophenyl)-1-phenylpyrazolone-5, colorless ndls. from MeOH, m.p. 113-114° (5); corresp. prod. from p-nitrophenylhydrazine, m.p. 203-204° (5).] Č on hydrolysis (Sap. Eq. = 170.5) yields methyl alcohol (1:6120) + o-chlorobenzoic acid (3:4150). [For studies of hydrolysis under various cond. see (2) (3) (7).] — For the amide, anilide, p-toluidide, and other derivs. corresp. to Č see o-chlorobenzoic acid (3:4150).

C₈H₇OCl

Beil. VII - 281

Insol. aq.; misc. alc. or ether. — \bar{C} does not yield an addn. prod. with NaHSO₃. [For prepn. of \bar{C} from chlorobenzene (3:7903) with Ac₂O + AlCl₃ in CS₂ (yields: 83-79% (15), 78-74% (5), 68-66% (1)) (8) (9) or with acetyl chloride (3:7065) + AlCl₃ in absence

of solvent (poor yield (2)) or in CS_2 (yields: 80-90% (16), 81% (6), 41% (17)) see indicrefs.; from p-chlorobenzoylacetic acid on warming (18); from methyl p-chlorobenzoylacetate (4) on ketonic hydrolytic cleavage by boilg. 10-12 hrs. with 20% H₂SO₄ see (4).]

[Č in CS₂ treated with 1 mole Cl₂ yields (19) p-chlorophenacyl chloride (3:2990), m.p. 101°; Č with 2 moles Cl₂ at 50-60° without solv. (19) yields 4, ω , ω -trichloroacetophenone [Beil. VII-283], m.p. 57°. — Č with 1 mole Br₂ in CS₂ or AcOH yields (17) (20) p-chlorophenacyl bromide [Beil. VII-285], cryst. from alc., m.p. 96.5° (20), 96° (17) (for studies of rate of bromination see (13), of influence of light and other factors see (21)); Č with excess Br₂ directly (22), in AcOH (17), or in CCl₄ susp. of CaCO₃ (22) yields 4-chloro- ω , ω -dibromoacetophenone [Beil. VII-286], m.p. 93.5-94.5° (22), 92.5° (17).] [Note proximity of this m.p. to that (96°) of p-chlorophenacyl bromide (above).]

[\ddot{C} on monontration with mixt. of conc. $HNO_3 + conc.$ H_2SO_4 at -10° as directed (6) or added slowly to 10 pts. HNO_3 (D=1.5) at 0° (23) yields 4-chloro-3-nitroacetophenone, ndls. from alc., m.p. 104° (6), 99- 101° (23) (accompanied in the former case (6) by a little 4-chloro-3-nitrobenzoic acid, m.p. 181°).]

 \bar{C} in alk. medium readily condenses with aldehydes: e.g., \bar{C} in dil. alc. with a little alk. gives (yields: 96% (24), 93% (25), 83% (7)) benzal p-chloroacetophenone (p-chlorochalcone), cryst. from ether of CHCl₃, m.p. 101° (24), 98.5° (7), 96.4° (12), 96° (25) (for study of rate of condensation see (12)); similarly \bar{C} with salicylaldehyde (1:0205) yields (23) salicylidene-p-chloroacetophenone, yel. ndls. from alc., m.p. 151° (23); \bar{C} with p-dimethylaminobenzaldehyde yields (26) p-dimethylaminobenzal-p-chloroacetophenone, yel. ndls. from alc., m.p. 140-140.5° (26); for corresp. condensation of \bar{C} with p-chlorobenzaldehyde (3:0765) see (16), with o-nitrobenzaldehyde see (27) (28).

[$\bar{\mathbf{C}}$ also readily condenses with esters: e.g., $\bar{\mathbf{C}}$ in abs. alc. + NaOEt treated with ethyl formate (1:3000) gives (28) hydroxymethylene-p-chloroacetophenone, yel. ndls. from pet. eth., m.p. 48-49° (28); $\bar{\mathbf{C}}$ with ethyl phenylacetate (1:3872) in ether with Na gives (40% yield (29)) ω -(phenylacetyl)-p-chloroacetophenone.]

[\bar{C} with PCl₅ at 100° for 4 hrs. gives (60% yield (30)) p,α -dichlorostyrene, b.p. 115–116° at 20 mm., m.p. -6 to -5°, $D_{-}^{25} = 1.247$, $n_{D}^{25} = 1.5735$ (30); \bar{C} with selenium oxychloride (SeOCl₂) gives (50% yield (31)) bis-(p-chlorophenacyl)selenium dichloride, m.p. 126° (31); \bar{C} with K pyrosulfate + a little cone. H₂SO₄ htd. at 80° for 4 hrs. (46% yield (32)) or \bar{C} with 1% I₂ htd. 4 hrs. at 170° (32) gives 1,3,5-tris-(p-chlorophenyl)benzene, white ndls. from AcOEt, m.p. 238° (32); for behavior of \bar{C} with NOCl see (33) (14), with NaOEt + amyl nitrite in alc. see (34) (35).]

[$\bar{\mathbf{C}}$ htd. as directed with excess NH₄ formate and the intermediate formyl deriv. hydrolyzed with HCl gives (yields: 82% (36), 65% (37)) d, l- α -(p-chlorophenyl)ethylamine, b.p. 105° at 10 mm., $D_{20}^{20} = 1.1178$, $n_{D}^{25} = 1.5420$ (hydrochloride, m.p. 192–193°, N-benzoyl deriv., m.p. 144–145° (36)).]

[Č on htg. with 10% aq. NaOH + Cu at 190° for 5 hrs. under press. yields (38) p-hydroxy-acetophenone (1:1527), m.p. 109°; Č with conc. aq. NH₄OH in pres. of Cu₂O htd. 5 hrs. at 220° under press. yields (39) p-aminoacetophenone [Beil. XIV-46, XIV₁-(366)]; Č on htg. with 50% KOH as directed (40) gives small yield of p-chlorobenzoic acid. (3:4940); Č with alc. NaOEt htd. in s.t. at 130°-140° gives (41) p-chlorophenyl-methyl-carbinol, p-chlorobenzoic acid, and other prods.]

 \tilde{C} on oxidn. with KMnO₄ (2) or in MeOH soln. with NaOH + Cl₂ (93% yield (42)) or with CrO₃ + H₂SO₄ (95% yield (43)) or by cat. vapor-phase oxidn. (90% yield (44)) gives p-chlorobenzoic acid (3:4940), m.p. 242°. [Note that \tilde{C} in abs. alc. refluxed with SeO₂ gives (45) p-chlorophenylglyoxal, m.p. 122° (for study of rate see (46)).]

p-Chloroacetophenone oxime: ndls. from alc., m.p. 95° (17). [This prod. with conc.

- H_2SO_4 htd. at 100° rearranges to acet-p-chloroanilide [Beil. XII-611, XII₁-(306)], m.p. 172-173° (17).]
- p-Chloroacetophenone phenylhydrazone: m.p. 114° (17), 112-113° (48) (decomposes on stdg. 2 days (17) (4).)
- p-Chloroacetophenone p-nitrophenylhydrazone: maroon cryst. from AcOH, m.p.
 239° (4).
- p-Chloroacetophenone 2,4-dinitrophenylhydrazone: scarlet cryst., m.p. 231° cor. (47).
- p-Chloroacetophenone semicarbazone: white cryst. from 40% AcOH, m.p. 200-201° (4).

Lachrymatory oil.

[For prepn. from acetophenone (1:5515) by actn. of Cl₂ (100% yield (4) (8)) in AcOH (80-94% yield (11)) see (4) (2) (11) or of sulfuryl chloride see (1); from phenylacetylene (1:7425) by actn. of HOCl (7), CH₃OCl (6), or C₂H₅OCl (5) see (7) (6) (5); from C₆H₆ + dichloroacetyl chloride (3:5290) (2) or dichloroacetonitrile (4) + AlCl₃ see (2) (4).]

 \bar{C} is almost unchanged by boiling with aq. (2). — \bar{C} on shaking with 20 pts. 2 N aq. NaOH dissolves in 1–2 min.; after boiling under reflux for a few min. and acidifying, extraction with ether gives in 95% yield (8) 85–90% yield (11) d,l-mandelic ac. (1:0465), cryst. from CHCl₃ + pet. eth., m.p. 118.5° (8).

 \tilde{C} on oxidn. with alk. KMnO₄ yields (1) (2) (3) (5) (6) benzoic ac. (1:0715), m.p. 121°. [\tilde{C} on treatment with NaOH + NaOCl in the cold yields benzoic ac. (1:0715) and chloroform in proportions depending upon conditions (9).] [Note that d,l-mandelic ac. (see above) may also be formed owing to actn. of alk. upon \tilde{C} cf. (9).]

 \bar{C} on nitration yields m-nitro- ω , ω -dichloroacetophenone, m.p. 57-58° (10).

Č in alc. treated with excess alk. NH₂OH for 7-10 hrs. yields (6) phenylglyoxaldioxime [Beil. VII-672], cryst. from CHCl₃, m.p. 168° (6). [The product, m.p. 150-152°, so obtd. by (5) may have been a mixt. of the high-melting stereoisomer, m.p. 180°, with the low-melting stereoisomer. m.p. 168°.]

[See also diethyl chloromaleate (3:6697).]

Colorless liq. with irritating actn. on skin and whose vapor strongly attacks the eyes. — Insol. cold aq., eas. sol. alc., ether; volatile with steam.

[For prepn. of \bar{C} from chlorofumaric acid (3:4853) in abs. EtOH with HCl gas (1) or conc. H₂SO₄ (4) see indic. refs.; from chlorofumaryl (di)chloride (3:6105) with EtOH see (10) (1) (9) (3).]

[For form. of \tilde{C} from diethyl d-tartrate (1:4256) with PCl₅ see (11) (note that ethyl hydrogen chlorofumarate, cryst. from pet. ether, m.p. $52-53^{\circ}$, has also been obtd. (12) as one of the prods. of this reactn.); from diethyl $d,l(?)-\alpha,\alpha$ -dichlorosuccinate by loss of HCl under actn. of dimethylaniline see (5).]

 $[\bar{C}\ (1\ mole)\)$ with diethyl sodio-malonate (1 mole) is said (13) to yield tetraethyl cyclopropane-1,1,2,3-tetracarboxylate [Beil. IX-991] although no details are given; in the presence of excess NaOEt in cold alc. for 12 hrs., however, the same components give (15-20% yield (14)) (15) triethyl γ -carbethoxyaconitate [Beil. II-876], b.p. 205-207° at 16 mm. (14); for reactn. of $\bar{C}\ (1\ mole)$ with diethyl mono- and di-substituted malonates yielding triethyl corresp. subst. aconitates see (13). — $\bar{C}\ (1\ mole)$ with ethyl sodioaceto-acetate (1 mole) in abs. alc. refluxed for ½ hr. gives (72% yield (3)) (16) triethyl γ -acetylaconitate [Beil. III-860], yel. oil, b.p. 187-188° at 15 mm. (3), the same as similarly obtd. (3) from diethyl chloromaleate (3:6697).]

[\bar{C} with o-chlorophenol (3:5980) or its Na deriv. in boilg. xylene for 2 hrs. gives (77% yield (17)) diethyl o-chlorophenoxyfumarate, b.p. 203-204° at 14 mm. (17). — \bar{C} with p-chlorophenol (3:0475) + NaOEt gives (17) diethyl p-chlorophenoxyfumarate, b.p. 199-200° at 12 mm. (17).]

The reactn. of C with NH₃ under various circumstances is disputed and confused and cannot profitably be discussed here; for refs. see Beil. II-745.

Č (1 mole) with hydrazine hydrate (2 moles) directly (18) or in alc. or AcOH (9) yields ethyl pyrazolone-5 (or 3)-carboxylate-3 (or 5) [Beil. XXV-206, XXV₁-(567)], ndls. from boilg. aq., m.p. 184-185° (18); 178° (9); note that in the direct treatment with just 2 moles of hydrazine hydrate much heat is evolved and the product ppts. on cooling; if excess base is employed (in which the prod. is soluble) neutralization with acid is necessary.

[Č with phenylhydrazine reacts much more slowly; however, after several hrs. at 100° phenylhydrazine HCl ppts. leaving an oil from which a cryst. prod. spar. sol. in boilg. AcOH but sepg. from it in colorless ndls., m.p. 272° dec., can be obtd. (18); this prod. is not, however, the ethyl 1-phenylpyrazolone-5(or 3)-carboxylate-3(or 5) which might be expected, but is regarded [Beil. XXVI-578] (18) as a 4,4'-bis derivative of it.

C on boilg, with 1:1 HCl and subsequent evapn, to dryness undergoes hydrolysis yielding (4) chlorofumaric acid (3:4853), m.p. 191.5° (4).

m-XYLYLENE DICHLORIDE

$$\begin{array}{cccc} CH_{2}Cl & C_{8}H_{8}Cl_{2} & \text{Beil. V - 373} \\ & V_{1}-\\ & V_{2}-(\mathbf{291}) \end{array}$$

B.P. 250-255°

M.P. 34°

See 3:0310. Division A: Solids.

2-CHLORONAPHTHALENE

B.P. 256°

M.P. 60°

Division A: Solids. See 3:1285.

ω,ω,ω-TRICHLOROACETOPHENONE 3:6874 (Phenyl trichloromethyl ketone)

 $D_{-}^{16} = 1.425 (2)$ B.P. 256-257° (1) 249° (2)145° at 25 mm. (2) 120-121° at 15 mm. (3) 128-132° at 14 mm. (4) at 14 mm. (5)

Colorless liq. with agreeable odor. — \bar{C} has no lachrymatory or hypnotic props.

[For prepn. of C from acetophenone (1:5515) with Cl₂ at 100-200° in sunlight see (2); from phenyl-trichloromethyl-carbinol by oxidn. with CrO₃ (6) or K₂Cr₂O₇ + H₂SO₄ (72% yield (4)) see indic. refs.; from ω , ω -dichloroacetophenone (3:6835) in AcOH + NaOAc with Cl₂ at 95-100° (79% yield (7)) cf. (2) see indic. refs.; from trichloroacetyl chloride (3:5420) with C₆H₆ + AlCl₃ (47% yield (1)) (5) (2) or from trichloroacetonitrile with C₆H₆ + AlCl₃ + HCl gas (70% yield (3)) see indic. refs.]

[For study of behavior of C with Cl2 or Br2 see (8).]

 \ddot{C} with 3 pts. fumg. HNO₃ gives (96% yield (8)) m-nitro- ω, ω, ω -trichloroacetophenone, yel. oil, b.p. 200-201° at 26 mm., 192-193° at 18 mm. (8); this prod. with aq. alk. splits smoothly and quant. to m-nitrobenzoic acid, m.p. 137-141° (8).

[C with alcohols in pres. of corresp. Na alcoholate gives high yields (9) (10) of corresp. benzoates; e.g., \bar{C} with MeOH + NaOMe gives (92-94% yield (9)) methyl benzoate (1:3586), Č with EtOH + EtONa gives (85% yield (9)) ethyl benzoate (1:3721) (for corresp. results with isopropyl alc. (9), benzyl alc. (9), linalool (1:6260) (9), menthol (1:5940) (9) (10), ethylene glycol (9), glycerol (9), and cetyl alc. (1:5945) (10) see indic. refs.); \bar{C} with phenols in pres. of KOAc gives corresp. benzoates; e.g., \bar{C} with phenol + KOAc gives (80% yield (10)) phenyl benzoate (1:2257), m.p. 70°; \bar{C} with o-cresol + KOAc gives (80% yield (10)) o-tolyl benzoate (1:4371); \bar{C} with p-cresol + KOAc gives (90% yield (10)) p-tolyl benzoate (1:2279), m.p. 71°.]

C with boilg. aq. is scarcely affected (2), but C refluxed 16 hrs. with 10 pts. aq. contg. a little KOAc, or C in acctone contg. a little aq. KOAc refluxed 4 hrs., gives (90-96% yield (10)) benzoic acid (1:0715), m.p. 121°.

Č with cold dil. alk. (3) (7) (5) readily splits yielding benzoic acid (1:0715) and chloroform (3:5050).

3:6874 (1) Biltz, J. prakt. Chem. (2) 142, 196-197 (1935). (2) Gautier, Ann. chim. (6) 14, 396-402 (1888). (3) Houben, Fischer, J. prakt. Chem. (2) 123, 318-319 (1929). (4) Florence, Bull. soc. chim. (4) 49, 926-927 (1931). (5) Staudinger, Kon, Ann. 384, 112 (1911). (6) Dinesmann, Compt. rend. 141, 202 (1905). (7) Aston, Newkirk, Dorsky, Jenkins, J. Am. Chem. Soc. 64, 1415 (1942). (8) Houben, Fischer, Ber. 64, 2651-2653 (1931). (9) Houben, Fischer, Ber. 64, 244-247 (1931). (10) Houben, Fischer, Ber. 64, 2639-2645 (1931).

Oil, sol. alc., ether, C6H6, or AcOH.

[For prepn. of \bar{C} from 3,4-dichlorotoluene (3:6355) at its b.p. with Cl_2 (1) (5) or with dry Cl_2 in pres. of 2-3% PCl_5 (2); no yields or details are given, and no further record of prepn. of \bar{C} is made.]

 \tilde{C} on hydrolysis with aq. in s.t. at 220° (3) (4), or with 4 wt. pts. of a mixt. of equal parts fumg. H₂SO₄ (10% SO₃) + conc. H₂SO₄ at 30-40° (yields: 66% (4), 36% (5)) cf. (6), or with 98% H₂SO₄ (no yield stated (2)), or with aq. + CaCO₃ on refluxing 9 hrs. (40% yield (5)) gives 3,4-dichlorobenzaldehyde (3:0550) q.v.

C on oxidn. (5) with chromic acid (1) slowly yields 3,4-dichlorobenzoic acid (3:4925) q.v.

Colorless oil, volatile with steam. — Note that presence of as much as 10% of 2-chloronaphthalene (3:1285) has no effect upon density of \bar{C} (9). — Note also that addn. of 1,4-dichloronaphthalene (3:1655), m.p. 68°, or of 1,6-dichloronaphthalene (3:0810), m.p. 48°, lowers m.p. of \bar{C} (9).

[For sepn. of mixts. of \bar{C} with the isomeric 2-chloronaphthalene by fractional freezing of their soln. in appropriate solvents see (6). — For purification of tech. \bar{C} by treatment with 1-2% alk. at 150° under reduced press. see (13). — For sepn. of \bar{C} from dichloronaphthalenes by means of its const.-boil. mixt. (b.p. 99°) with aq. see (18).]

[For prepn. of \tilde{C} from α -naphthylamine [Beil. XII-1212, XII₁-(519)] via diazotization and use of Cu₂Cl₂ reactn. (70-75% yield (9)) (8) (7) or even by warming diazo soln. with HCl (10-20% yield (14)) or from diazonium/ZnCl₂ cpd. on addn. to phenol at 60° (46% \tilde{C} + 29% hydroxybiphenyl + 20% diphenyl ether (62)) see indic. refs.; from α -naphthalenesulfonyl chloride [Beil. XI-157, XI₁-(37)] (2), or from 1-nitronaphthalene [Beil. V-553, V₁-(264)] (15), or from β -naphthol (1:1500) (16) with PCl₅ as directed see indic. refs.; for formn. of \tilde{C} from 1-nitronaphthalene with Cl₂ see (17).]

[For prepn. of C from naphthalene with Cl₂ in boilg. naphthalene (19) (48), in vapor phase (20) (22) (27), in various solvents (21) (22) (23) (24) (25) (26) see indic. refs.; from naphthalene with HCl gas + air in pres. of cat. see (28); from naphthalene with PbCl₄-2NH₄Cl at 140-150° (29) or with SO₂Cl₂ + AlCl₃ (79% yield (30)) see indic. refs.; from

naphthalene dichloride [Beil. V-519] with boilg, alc. KOH (31) cf. (32) or by distn. (33) cf. (34) see indic. refs.]

[For thermal anal. of systems of \tilde{C} with SbBr₅ see (35); with PkOH see (36); with 2,4,6-trinitroresorcinol (styphnic acid) see (37).]

[C with Cl₂ in cold or C with Cl₂ in lt. pet. yields (38) 1-chloronaphthalene tetrachloride, m.p. 131° (38), and 1,4-dichloronaphthalene (3:1655), m.p. 68° (38); C with Cl₂ in CHCl₃ yields (38) the above 1-chloronaphthalene tetrachloride and 1,4-dichloronaphthalene tetrachloride, m.p. 172° (38); C with Cl₂ in CS₂ gives (38) a new dichloronaphthalene tetrachloride, m.p. 158° (38).]

[C on chloromethylation with paraformaldehyde + HCl gas + H₃PO₄ in AcOH gives (81) 1-chloro-4-(chloromethyl)naphthalene, m.p. 78-79° (81).]

[\bar{C} is not reduced with excess 5% Na/Hg in alc. even after 5 hrs. (39) nor by HI + P at 182° for 10 hrs. (42); however, \bar{C} in boilg. AmOH treated with Na yields (40) 1,4-dihydronaphthalene [Beil. V-518, V₁-(249)] (identified by addn. of Br₂ giving dibromide, m.p. 74° (40)) and 1,2,3,4-tetrahydronaphthalene (1:7550) q.v.; furthermore, \bar{C} with Mg in boilg. MeOH evolves gas and upon acidification and pouring into aq. gives alm. quant. yield (41) naphthalene (1:7200), m.p. 80°.]

 $[\bar{C}$ on cat. oxidn. with air at 250-300° gives (43) 97% phthalic anhydride (1:0725) + 3% 3-chlorophthalic anhydride (3:3900).

[\bar{C} with Li in s.t. 17½ hrs. at 263° followed by treatment with aq. gives (444) naphthalene (1:7200) + 1,1'-binaphthyl [Beil. V-725, V₁-(358)], m.p. 156°. — \bar{C} with Li in dry ether yields soln. of α -naphthyl-lithium which with Me₂SO₄ gives (77% yield (45)) 1-methyl-naphthalene (1:7600), the reactn. of \bar{C} with Li occurring even more readily (46) than with Mg.]

[\tilde{C} with Mg at 200-220° reacts very energetically and is complete within a few minutes; naphthalene sublimes abundantly, and yield of α -C₁₀H₇MgCl is only 10-13% (47).]

[\bar{C} with AlCl₃ at 100° gives small amts. (50) naphthalene (1:7200) + 2-chloronaphthalene (3:1285).]

[\bar{C} with CuCN in pyridine htd. 24 hrs. in bath at 245–250° (92% yield (10)) or \bar{C} with K₄Fe(CN)₆ + pyridine at 270° for 18 hrs. (49) gives α -naphthonitrile [Beil. IX-649, IX₁-(275)], b.p. 299° cor., b.p. 173–174° at 27 mm., 166–169° at 18 mm. (10).]

[C does not with Ag 3,5-dinitrobenzoate yield corresp. ester (80).]

[\bar{C} with 15% aq. NaOH above 300° for 12 hrs. gives (46% yield (51)) α-naphthol (1:1500); \bar{C} with 5 moles 3-25% aq. NaOH at 350-360° under pressure in pres. of Cu for 1 hr. gives (52) a mixt. of α-naphthol (1:1500) + β-naphthol (1:1540). — \bar{C} with aq. Na₂CO₃ + Cu at 300° under press. (53) or \bar{O} with aq. Na₂CO₃, Na₂HPO₄, or Na₂B₄O₇ at 325° and 280 atm. (54) yields α-naphthol (1:1500). — \bar{C} with aq. vapor over cat. at 300-400° yields (55) α-naphthol (1:1500).]

[\bar{C} with conc. aq. NH₄OH + CuO at 150-250° under press. (56) or \bar{C} with conc. aq. NH₄OH + Cu₂Cl₂ + Ca(OH)₂ at 225-230° under press. (57) cf. (58) yields α -naphthylamine (for study rate of reactn. see (58) (61); under suitable conditions the main prod. may be di- α -naphthylamine (60).]

[Č with KNH₂ in liq. NH₃ at -33° gives (82) only 2-3% α -naphthylamine, the main prod. (43-53%) being β -naphthylamine; for behavior of \bar{C} with LiNEt₂ see (83).]

[C on mononitration, e.g., with a mixt. of conc. HNO₃ (D = 1.4) (1 mole) + conc. H₂SO₄ (2 moles) at 0° (63) cf. (64) (65) (66) gives a mixt. of three mono nitro derivs., viz., 1-chloro-4-nitronaphthalene [Beil. V-555, V₁-(264)], pale yel. ndls. from alc., m.p. 85° (66) (63), 87-87.5° (67); 1-chloro-5-nitronaphthalene [Beil. V-556], m.p. 111° (63) (68); and 1-chloro-8-nitronaphthalene [Beil. V-556], ndls. from AcOH or C₆H₆, m.p. 94° (63), 93-94° (69). (Note that the relative proportions of these three mononitration products

vary rather widely acc. to conds. (63); that thermal anal. of various combinations of these three isomers have been recorded (65); and that of the other possible isomers the only ones reported are 1-chloro-2-nitronaphthalene, pale yel. ndls. from lt. pet., m.p. 80.5-81° (67), 76° (70) (71), and 1-chloro-6-nitronaphthalene, m.p. 118-120° (72), both prepd. indirectly.)]

[C on dinitration, e.g., with warm conc. HNO₃ (66) or fumg. HNO₃ (66), or 1-chloro-8-nitronaphthalene (above) on further nitr. (73) gives 1-chloro-4,8-dinitronaphthalene [Beil. V-561], m.p. 138° (73), and 1-chloro-4,5-dinitronaphthalene [Beil. V-561], m.p. 180° (66) (68); note that the only other recorded isomer, viz., 1-chloro-2,4-dinitronaphthalene [Beil. V-561, V₁-(265)], m.p. 146.5° cor., is obtd. only by indirect means, i.e., from 2,4-dinitronaphthol-1 with p-toluenesulfonyl chloride in diethylanline (74).]

[No record can be found of direct trinitration of \bar{C} ; the only two recorded 1-chlorotrinitronaphthalenes, viz., 1-chloro-2,4,5-trinitronaphthalene [Beil. V_{1} -(265)], m.p. 143-144°, and 1-chloro-2,4,8-trinitronaphthalene [Beil. V_{1} -(265)], m.p. 118-126°, have been obtd. from nitration (75) of 1-chloro-2,4-dinitronaphthalene (above).]

[\bar{C} with conc. H₂SO₄ at 140° yields (76) (77) mainly 1-chloronaphthalenesulfonic acid-4 [Beil. XI-160] (see also below).]

- ₱ 1-Chloronaphthalenesulfonamide-4 (4-chloronaphthalenesulfonamide-1): cryst. from dil. alc., m.p. 185–186° u.c. (78). [From \(\bar{C}\) with chlorosulfonic acid as directed, followed by conversion of the intermediate 1-chloronaphthalenesulfonyl chloride-4, m.p. 92–93° u.c., with (NH₄)₂CO₃ to the desired sulfonamide (78).]
- ---- 1-Chloronaphthalene picrate: m.p. 137° (50), 135° (11), 125.7° (36). [Note that this cpd. with PkOH forms a cutectic, m.p. 104.7°, contg. 16.3% (36).]
- ---- 1-Chloronaphthalene styphnate: m.p. 126-128° (79), 109.8° (37). [From Č (1 mole) + 2,4,6-trinitroresorcinol (1 mole) (styphnic acid) in hot alc. (79); Neut. Eq. calcd. 203.8, found (79) 207.8.]

3:6880 o-CHLOROBENZOTRICHLORIDE $C_7H_4Cl_4$ Beil. V - 302 $V_{1-}(153)$ $V_{2-}(234)$

B.P.	M.P.	
260° (1) (2)	30° (1) (2) (4)	$D_{-}^{-}=1.51 (1)$
129.5° at 13 mm. (2)	29–30° (5)	
115-118° at 5-6 mm. (3)		

Colorless liq. with faint but not disagreeable odor.

[For prepn. of \bar{C} from salicylic acid (1:0780) with PCl₅ see (1) (4); from o-chlorobenzoyl chloride (3:6640) with PCl₅ in s.t. at 200° for several days see (2); from o-chlorotoluene (3:8245) with Cl₂ at 130° (5) in pres. of PCl₃ (9), or from o-chlorotoluene- α -sulfonyl chloride (3) with Cl₂ at 150–180° (3), see indic. refs.; for formn. of \bar{C} from benzotrichloride (3:6540) with Cl₂ see (6) (7); for purification see (8).]

[For condens. of \tilde{C} with 1-hydroxynaphthoic acid-2 [Beil. X-331, X₁-(144)] to yield 1-hydroxy-4-(o-chlorobenzoyl)naphthoic acid-2, m.p. 213° (11), see (10) (11) (12); for reactn. of \tilde{C} with o-chlorobenzoic acid (3:4150) + ZnCl₂ to yield o-chlorobenzoyl chloride (3:6640) see (13); for reactn. of \tilde{C} with 99% HF yielding o-chlorobenzotrifluoride, b.p. 149-152°, see (14).]

Beil. X - 163

[\bar{C} on htg. with Cu powder in C₆H₆ for 25 hrs. gives (5) a mixt. of the two stereoisomeric forms of 1,2-bis-(o-chlorophenyl)-1,2-dichloroethylene, [Beil. V-635]; by repeated cryst. from pet. ether this mixt. is separable into 3 pts. higher-melting stereoisomer, m.p. 172° (5), and 1 pt. lower-melting stereoisomer, m.p. 129° (5).]

Č on hydrolysis, e.g., by htg. with aq. in s.t. at 150° (1) or by boilg. with conc. HNO₃ (2), yields o-chlorobenzoic acid (3:4150) q.v.

$$90.8^\circ \qquad \text{at } 1 \text{ mm. } (6)$$

[For prepn. of \bar{C} from p-methoxybenzoic acid (p-anisic acid) (1:0805) with PCl₅ (93% yield (3)) (4) (9) (10) (11) or with SOCl₂ (6) (7) (12) (13) see indic. refs.; from sodium p-anisate with oxally chloride (3:5060) in $C_0H_6(75-90\%$ yield) see (14).]

[\bar{C} with 3% H_2O_2 in acetone + pyridine at 0° yields (15) di-p-anisyl peroxide, cryst. from AcOEt or pet. eth., m.p. 128° (15); for reactn. of \bar{C} with H_2S_2 + ZnCl₂ giving (60% yield) di-p-anisyl disulfide see (30).]

[$\bar{\mathbf{C}}$ on cat. reductn. with \mathbf{H}_2 and cat. as directed gives (81% yield (16)) p-methoxybenzaldehyde (1:0240) (under some conds. (17) reductn. goes to p-methoxytoluene (methylp-tolyl ether) (1:7495)).]

[Although 2-methoxybenzoyl chloride (3:6870) with anhydrous Na₂CO₃ + pyridine gives the corresp. anhydride, this reactn. is not specifically reported for Č; however, Č + a tertiary amine (pyridine) in C₆H₆ with excess K₂S₂O₅ yields (18) p-methoxybenzoic acid anhydride, m.p. 99-100° (18).]

[Č with C₆H₆ + AlCl₃ yields (1) p-methoxybenzophenone (1:5170); Č with toluene + AlCl₃ gives (40% yield (11)) 4-methoxy-4'-methylbenzophenone, cryst. from alc., m.p. 89° (11); Č with perylene + AlCl₃ in CS₂ gives (19) 3,9-bis-(p-methoxybenzoyl)perylene, m.p. 319.5° (19).]

[C condenses with many phenol ethers in pres. of AlCl₃; e.g., for reactn. of C with anisole

yielding 4,4'-dimethoxybenzophenone [Beil. VIII-317, VIII₁-(641)], m.p. 143-144° (20), see (20) (21); for \tilde{C} with phenetole yielding 4-methoxy-4'-ethoxybenzophenone, m.p. 112° (13), 111° (20), see indic. refs.; for \tilde{C} with pyrocatechol dimethyl ether (veratrole) (1:7560) yielding 3,4,4'-trimethoxybenzophenone [Beil. VIII-422], m.p. 98-99°, see (22); for \tilde{C} with resorcinol dimethyl ether (1:7570) yielding 2,4,4'-trimethoxybenzophenone [Beil. VIII-(702)], m.p. 70-71° (23), see (23); for \tilde{C} with phloroglucinol trimethyl ether (1:7148) yielding 2,4,6,4'-tetramethoxybenzophenone [Beil. VIII-496], m.p. 146°, see (22); for \tilde{C} with many other phenol ethers see (20).]

[\bar{C} with MeZnI (24) or better with Me₂Cd (25) gives (yields: 25% (24), 84% (25)) p-methoxyphenyl methyl ketone (p-methoxyacetophenone) (1:5140), m.p. 38°; \bar{C} with C₆H₅ZnBr gives (65% yield (26)) p-methoxybenzophenone, (1:5170), m.p. 61°, b.p. 202° at 14 mm. (26).]

[\bar{C} with ethyl sodioacetoacetate yields (4) ethyl α -(p-methoxybenzoyl)acetoacetate [Beil. X-1004]; \bar{C} with ethyl sodio- α , γ -dimethoxyacetoacetate yields (27) ethyl α , γ -dimethoxy- α -(p-anisoyl)acetoacetate (which on ketonic hydrolytic cleavage yields (27) ω ,4-dimethoxyacetophenone).]

[Č (1 mole) with HCN (4 moles) in dry ether + pyridine gives (12) p-methoxybenzoyl cyanide, m.p. 63°, b.p. 150° at 12 mm. (12); Č with KCN + quinoline yields (28) 1-(p-anisoyl)-2-cyano-1,2-dihydroquinoline, m.p. 120°, which upon acid hydrolysis gives (57% yield (28)) p-methoxybenzaldehyde (p-anisaldehyde) (1:0240).]

[\bar{C} with urea refluxed in C₆H₆ for 15 hrs. yields (29) N-(p-methoxybenzoyl)urea, ndls. from alc., m.p. 215° (29).]

[For reactn. of \tilde{C} with K_2S in alc. + ether yielding K salt of p-methoxythiobenzoic acid see (30); for reactn. of \tilde{C} with sodium phenylacetylene see (31); for reactn. of \tilde{C} with diphenylketene see (32); for reactn. of \tilde{C} with d-glucose and other carbohydrates see (33); for reactn. of \tilde{C} with 3,4-dimethoxyphenylethylamine (34) or with β -(n-butylamino)ethanol (3) see indic. refs.]

 \tilde{C} with MeOH yields methyl p-methoxybenzoate (methyl p-anisate) (1:2128), m.p. 49°; \tilde{C} with EtOH yields ethyl p-anisate (1.4191), b.p. 269°, m.p. $+7^{\circ}$ (for study of rate of reactn. of \tilde{C} with EtOH see (8) (35)).

 \bar{C} on hydrolysis yields p-methoxybenzoic acid (1.0805), m.p. 184°; for the amide, anilide, p-toluidide, and other derivs. corresp. to \bar{C} see p-methoxybenzoic acid (1.0805).

See 3:2290. Division A: Solids.

[See also unsym.-o-phthalyl dichloride (3:2395).]

The m.p. of ord. samples of \bar{C} is usually abt. 12°, but distr. at ord. press. (7) yields a prod. with m.p. 16°. The chem. of \bar{C} is closely connected with that of the isomeric unsym.-o-phthalyl dichloride (3:2395) q.v.; for f.p./compn. curve for mixts. of the two isomers see (8).

[For prepn. of \bar{C} from phthalic anhydride (1:0725) with PCl₅ (92% yield (7)) (1) (3) (9) (10), with PCl₃ + Cl₂ (12), with benzotrichloride (3:6540) + a little ZnCl₂ (13), with a little ZnCl₂ at 220° by grad. addn. of SOCl₂ (100% yield (14)) (15), or with CCl₄ (etc.) + 2% ZnCl₂ at 250-280° (16) see indic. refs.; from phthalic acid (1:0820) with benzotrichloride + a little ZnCl₂ see (17).]

[For prepn. of \tilde{C} from unsym.-o-phthalyl dichloride (3:2395) by htg. at 150° for 1 hr. see (5); from thiophthalic anhydride [Beil. XVII-486, XVII₁-(256)] with dry Cl₂ at 245° see (18); for formn. as by-product of action of Cl₂ on o-toluoyl chloride (3:8740) see (19).] [For purification of \tilde{C} by treatment with MgO or CaO see (20).]

C on htg. with AlCl₃ (½ mole), then deeg. cpd. with aq. and extracting with pet. ether, isomerizes (72% yield (7)) (1) (21) to unsym.-o-phthalyl dichloride (3,3-dichlorophthalide) (3:2395), m.p. 89°.

[C with Cl₂ at 120-170° in pres. of Fe yields (22) tetrachlorophthalic acid (3:4946).]

[\bar{C} on reduction with Zn + HCl (23) (24) or HI + P in CS₂ (23) (25) yields phthalide (1:4920); \bar{C} on boilg. with AcOH + Na/Hg yields (26) phthalyl alcohol (o-xylylene glycol) [Beil. VI-910].]

 \bar{C} on heating with K in xylene (27), or with ter-bases + $K_2S_2O_5$ (28), or with $ZnCl_2$ + SO_2 at 200° (14) yields phthalic anhydride (1:0725). [Note that last reaction is the reverse of an impt. method (15) of prepn. of \bar{C} .]

[C on shaking for 20 min. at 60° in glass flask with ZnF₂, then extracting with pet. eth. yields (29) o-phthalyl difluoride, m.p. 42-43°, b.p. 224-236° at 760 mm. (29); C with HBr gas at 150-160° gives (50% yield (30)) sym-o-phthalyl dibromide, m.p. 78-81° rap. htg., b.p. 191° at 24 mm., 134° at 2 mm. (30).]

[C htd. with a little ZnCl₂ and diethyl ether (31) or diethyl phthalate (32) gives (80% yield (31)) ethyl chloride (3:7015).] [Use in mfg. of alkyl chlorides (33).]

[For reactn. of \bar{C} with glycols see (34); for use of \bar{C} in acylation of cellulose see (35).]

[For behavior of \bar{C} with H_2O_2 yielding phthalyl peroxide see (36); with PCl_5 see (37); with NaN_3 see (38) (39); with C_6H_5MgBr see (40).]

 $\bar{\mathbf{C}}$ on treatment with cold conc. NH₄OH followed by acidification yields (41) (42) o-cyanobenzoic acid [Beil. IX-814, IX₁-(365)], m.p. 190° dec., converted by htg. to phthal-imide, m.p. 228.5° u.c. [For reactn. of $\bar{\mathbf{C}}$ with dimethylamine yielding N,N,N',N'-tetramethyl-o-phthaldiamide, m.p. 121-122°, see (43); with diethylamine yielding (44) (45) corresp. N,N,N',N'-tetra-ethyl-o-phthaldiamide, m.p. 36° (44), 39° (45) see indic. refs.]

C htd. with 1 mole acetamide until no more HCl is evolved gives in good yield (46) N-acetylphthalimide, cryst. from toluene, m.p. 135-136° (46); similarly benzamide gives N-benzoylphthalimide, m.p. 168° (46).

 \bar{C} reacts instantly with aniline yielding (29) sym.-phthalyldianilide, m.p. 253-255°. [Note that when \bar{C} is treated with aniline in ether or C_6H_6 and stood for some time the prod. has m.p. about 231°; when recrystd. from EtOH, however, the m.p. rises to 253-255°. This apparent anomaly is attributable to the pres. in most samples of \bar{C} of some phthalic anhydride whose slower reactn. with aniline contaminates the main prod. but is removed by recrystn. from alc. If, on reactn. of ord. \bar{C} with aniline, the resultant ppt. is filtered at once (before the anhydride has reacted), washed with C_6H_6 , alc., and then aq., the prod. shows m.p. 253-255° without recrystn. (29).]

Č on hydrolysis yields o-phthalic acid (1:0825) q.v.

[For use of \bar{C} in prepn. of acid anhydrides by htg. at 110–120° with salts of aliph. or arom. acids see (21).]

 \bar{C} hydrolyzes slowly with cold but rapidly with hot aq. yielding (1) benzophenone (1:5150) and HCl (for study of rate of hydrol, of ether soln, on shaking with aq. see (22)); \bar{C} dis. in conc. H₂SO₄ with yel, color (which grad, disappears) and on pouring onto ice yields (6) benzophenone (1:5150); \bar{C} in dry ether shaken 2 hrs. with silver oxide gives (78% yield (23)) benzophenone (1:5150); \bar{C} with alc. NH₃ yields (33) benzophenone.

 \ddot{C} with MeOH alone (6), with dry MeOH + Mg (24), with dry MeOH in dry pyridine at 0° (25), with NaOMe in MeOH (3) (26), or with NaN₃ in dry MeOH (27) gives (yields: 86% (6) (24), 81% (3)) α,α -dimethoxy-diphenylmethane (benzophenone dimethylacetal) [Beil. VII-415], cryst. from MeOH, m.p. 107-108° (25), 107.5° cor. (24), 106.5-107° (3) (for application to higher alcs. see (3) (26)).

Č htd. with Ag (11) (5), or stood overnight with Ag or Zn in dry EtOAc (28) cf. (29), or refluxed in CS₂ with 3-4 moles Hg (28) (less Hg gives different result), or with 2 moles NaI in boilg. acetone (30) (1 mole NaI gives different result), or with excess cyclohexyl-MgBr (31) (less reagent gives different result), or with Na in liq. NH₃ (90% yield (32)) or htd. 8 hrs. with diphenylmethane (1:7120) (88% yield (12)) gives tetraphenylethylene [Beil. V-743, V₁-(376)], m.p. 227° cor., 222° u.c. (31), 221° (11). — [Č does not react with

Mg in dry ether even in pres. of I_2 (28).] — [\check{C} refluxed in CS_2 with less than 3 moles Hg (28), or \check{C} with 1 mole NaI in acetone in cold (30), or \check{C} with 1 mole cyclohexyl MgBr (31), gives tetraphenylethylene dichloride [Beil. V_1 -(371)], cryst. from ether, m.p. 186° cor. dec. (31).]

[Č with 2 moles Ag azide in ether gives (88% yield (34)) benzophenone diazide, m.p. 42°; Č treated as directed (15) with alc. NaSH gives 42–50% yield thiobenzophenone [Beil. VII-429, VII₁-(232)], cryst. from pet. ether, m.p. 53–54° (15) (note that an excess of Č must always be present to prevent reduction of the thiobenzophenone to dibenzohydryl disulfide [Beil. VI-681], ndls. from alc., m.p. 152°, and that the latter is obtd. in 70% yield (15) if Č is added to the alc. NaSH instead of the reverse); for reactn. of Č with diethyl sodio-malonate (2) (9) or with ethyl sodioacetoacetate (8) see indic. refs.; for reaction of Č with SbF₃ yielding α,α -difluorodiphenylmethane, b.p. 260° dec., 125° at 10 mm., m.p. -1.8° , $D_{4}^{20} = 1.1614$, $n_{D}^{20} = 1.53786$, see (35).]

 \bar{C} with 4 moles aniline in cold gives (36) benzophenone anil [Beil. XII-201, XII₁-(174)] + aniline hydrochloride; the former is sol. in ether, the latter in aq.; sepn. of the layers and addition of alc. to the ether ppts. benzophenone anil, pale yel. lfts. from abs. alc., m.p. 109° u.c. (36) 113°.

CHAPTER XVI

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 2. D_4^{20} less than 1.1500

(3:7000-3:7499)

3:7000	CHLOROACETYLENE (Chloroethyne)	HC≡C—Cl	C₂HCl	Beil. I - 244 I ₁ -(106) I ₂ -(221)
B.P	29.6° (1) 32 to -30° (2)			-2 ()

[See also dichloroacetylene (3:5010).]

C is a gas with extremely nauseating odor reminiscent both of yellow phosphorus and of carbylamines; its inhalation even in traces produces very unpleasant symptoms. It is also treacherously explosive and may detonate during manipulation (2). — C ignites spontaneously in air (6) (3).

[For prepn. of C from cis-1,2-dichloroethylene (3.5042) via treatment in dil. alc. with aq. alk. Hg(CN)₂ to yield Hg(C=CCl)₂ (see below) which is then warmed (under N₂) with alk. NaCN soln. see (1) (2) (3) (4)] cf. (7).

[For formn. of C during reaction of 1,1,2,2-tetrachloroethane (acetylene tetrachloride) (3:5750) with solid KOH see (5); from 1,2-dichloroethylene with alc. KOH see (3) (4); from \$,\$-dichloroacrylic acid (3:1875) with Ba(OH)₂ see (6).]

C with NH₄OH/CuCl gives (3) (6) an explosive ppt. — C with NH₄OH/AgNO₃ gives (2) (3) a ppt. of silver salt, which is extremely explosive, detonating with great violence not only in dry state but also when moist and even under water, quantities as small as 0.1 g. causing considerable damage (2).

C with aq. alk. Hg(CN)₂ yields (3) (4) (1) (2) a mercury salt, Hg(C=CCl)₂, cryst. from CHCl₃ (1) (2) (3) (4), m.p. 185° (1) (4), 186° (2); explodes at 195° with flame and deposition of soot (3) (4). [This prod. with alk. KCN evolves C (use in prepn. of C as above).]

Č with Br₂/aq. yields (6) 1-chloro-1,1,2,2-tetrabromoethane [Beil. I-95], m.p. 33-34° (6). [For other reactns, see (2) (7); for study of oxidation of \bar{C} see (1).]

(4) Hofmann, Kirmreuther, Ber. 41, 314-317 (1908). (5) Sastry, J. Soc. Chem. Ind. 35, 450-452 (6) Wallach, Ann. 203, 87-94 (1880). (7) Ott, Dittus, Weissenburger, Ber. 76, 87-88 (1916).(1943).

3:7005	CHLOROMETHANE (Methyl chloride)	CH₃.Cl	CH ₃ Cl	Beil. I - 59 I ₁ -(8) I ₂ -(11)
	2° at 760 mm. (1) ° at 760 mm. (3) (4)	M.P. -97.72° (1) -96.65° (2)	$n_{ m D}^{-42}$.5 = 1.3830 (3)

930

Colorless gas with ethereal faintly sweet non-irritating odor. — Important comml. fluid for refrigerating systems; for extensive reviews of properties, uses, handling, toxicity, hazards, etc., see (4) (5) (6). — For b.p. at various pressures from 26-761 mm. together with extensive thermodynamic data see (1) (4). — Solubility of \bar{C} (in cc.) in 100 cc. solvent at 20°C and 760 mm.: water, 303; EtOH, 3740; AcOH, 3679; CCl₄, 3756; C₆H₆, 4723 (4); for extensive data on solubility of \bar{C} in other solvents see (7) (8) (9).

[For prepn. of \bar{C} from MeOH (1:6120) with conc. H₂SO₄ + NaCl (10); with conc. HCl + ZnCl₂ (yield: 79% (11), (12)); with HCl gas + various catalysts (13) (14) (15); with PCl₃ + ZnCl₂ (68% yield (11)); with PCl₅ + ZnCl₂ (72% yield (11)); with SOCl₂ + pyridine (80% yield (11)); with AlCl₃ (100% yield (16)); with FeCl₃ (17) (20) see indic. refs.; for prepn. of \bar{C} from Me₂SO₄ with strong HCl (or NaCl) (90% yield (18)) or with AlCl₃ (100% yield (19)) see indic. refs.] [For study of mechanism of formn. of \bar{C} from MeOH + HCl see (24).] [For formn. (53% yield) from NH₄Cl with diazomethane in ether see (36).]

[For study of drying of \bar{C} see (21); for detn. of aq. in \bar{C} see (22); for study of pyrolysis see (23); for behavior with Na see (25).]

 \tilde{C} on warming with NaI in MeOH or EtOH gives (26) methyl iodide, b.p. 42°. [Use in detection and detn. of \tilde{C} (26).]

 \ddot{C} is inflammable in air within range 8.1-17.2% by vol. (4) (28) cf. (35). — [For study of detn. of \ddot{C} via combustion see (27) (29) (31) (32).] — \ddot{C} on burning in presence of copper gives strong Beilstein test; [use in detection and detn. of \ddot{C} in air and foods (29); for testing device see (30)].

[For detn. of \bar{C} by absorption in AcOH see (27); for detn. of small amts. of \bar{C} in air (31) (37) or in mixts. with other gases (32) see indic. refs.]

- Acetanilide: m.p. 112-113° u.c. (33). [From C via conversion to CH₃MgCl and reaction with phenyl isocyanate (33): note that C with Mg in dry ether + trace I₂ gives in 4 hrs. (99.7% yield) MeMgCl (38).]
- —— N-Methyl-3-nitrophthalimide: ndls. from CS₂, m.p. 112-113° (34). [Not recorded directly from C but from MeI by reactn. with K 3-nitrophthalimide; probably therefore from C + NaI + K 3-nitrophthalimide in MeOH.]

3:7010 CHLOROETHENE CH₂=CHCl C₂H₃Cl Beil. I - 186 (Vinyl chloride) I_1 -(77) I_2 -(157)

B.P. -13.9° at 760 mm. (1) F.P. -159.7° (1)

Colorless gas easily liquefied by cooling. — For b.p.'s at various pressures from 39.5—760.3 mm. see (1). — Readily polymerizes in light or in dark if catalysts are present. The literature on polymerization of \bar{C} and on its polymers and copolymers is extremely extensive and cannot be treated here.

[For prepn. of \bar{C} from 1,2-dichloroethane (ethylene dichloride) (3:5130) by action of alc. KOH (85% yield (2)) see (2) (3); for prepn. of \bar{C} from acetylene by addn. of HCl see (4) (5) (14) (15) + Beil.; for purification of \bar{C} with conc. H₂SO₄ see (8).]

Č as liq. + SO₂ as liq. in 95% alc. + catalyst gives ppt. (6) of insol. pdr. of vinyl chloride polysulfone [(CH₂=CHCl)₂.SO₂]_n, darkens 135-140°, melts 250-275° (6); on hydrolysis with 20% aq. NaOH this polymer gives (7) acetaldehyde (1:0100) q.v.

 $\ddot{\mathbf{C}}$ adds HBr to give according to conditions (9) (10) either 100% 1-chloro-1-bromoethane (ethylidene chlorobromide), b.p. 82.7° at 760 mm. (11), b.p. 80.5-81.5° at 735 mm. (9), $n_D^{20} = 1.4660$ (9), or 1-chloro-2-bromoethane (ethylene chlorobromide), b.p. 106.7° at 760 mm. (12), b.p. $104-105^\circ$ at 735 mm. (9), $n_D^{20} = 1.4908$ (9). [Note: the ethylidene chlorobromide may be further identified by htg. with moist silver oxide in a s.t. for 5 hrs. at 100° giving acetaldehyde (1:0100) q.v.; the ethylene chlorobromide may be further identified by refluxing with aniline to yield N,N'-diphenylethylenediamine, m.p. $63.5-64^\circ$ (9).]

Č with HI yields only (9) 1-chloro-1-iodoethane (ethylidene chloroiodide), b.p. 117-119° (13), 114-115° (9).

Č adds Br₂ yielding (16) (17) 1-chloro-1,2-dibromoethane, b.p. 159-160° (16); 163° at 760 mm., 48° at 12 mm.; $D_{-i}^{19} = 2.248$; $n_{-}^{19} = 1.554$ (17); for study of this photochem. reaction see (18).

3: 7015 ETHYL CHLORIDE (Chloroethane) CH₈CH₂Cl C₂H₅Cl Beil. I - 82 I₁-(23) I₂-(50)

B.P. F.P. +13.1° at 760 mm. (1) (2) -142.5° (15) [
$$D_4^{15} = 0.90280$$
 (11)] 12.6° (3) -141.6° (16) $n_D^0 = 1.3790$ (10) [12.5-12.6° at 725 mm. (4)] -140° (17) $D_{12}^{12} = 0.8510$ (19) 12.52° (5) -139.4° (18) $n_D^{-20} = 1.3913$ (2) 12.50° (6) -138.7° (1) $D_8^8 = 0.9176$ (12) 12.5° (7) (8) (9) -136.4° (11) $n_D^{-50} = 1.4085$ (2) 12.4° (10) $D_0^0 = 0.92138$ (20) 12.18° at 760 mm. (12) 12-12.5° (13) (14)

Colorless mobile liq. with pungent ethereal odor and sweetish taste. — $\bar{\mathbf{C}}$ is inflammable (see also below) and burns with smoky green-edged flame producing fumes of HCl.

SELECTED PHYSICAL PROPERTIES

Vapor pressure. [For vapor-press. data over various temp. ranges, e.g., from -30 to $+40^{\circ}$ (5), -30° to 100° (21), $12-187^{\circ}$ (4) (22), see indic. refs.]

Solubility relations. \bar{C} is very spar. sol. aq., e.g., 100 g. aq. at 0° dis. 0.447 g. \bar{C} (23), 0.570 wt. % (24), although even this is somewhat more than its homologs (24).

 \bar{C} is miscible with EtOH although forced out of soln. by addn. of aq. (25); for use of mixt. of EtOH (50-80%) + aq. (50-20%) as selective solv. for \bar{C} in sepn. from butane see (26). — \bar{C} is also miscible with ether. — [For study of rate of volatilization of \bar{C} from solns. in ether or oils see (32).]

[For soly. of \bar{C} in CCl₄ (3:5100) or in ethylene dichloride (3:5130) at -10° and 20° and at 100-760 mm. press. see (27); for soly. of \bar{C} in various high-boilg. ethers and esters of interest to refrigeration industry see (28) (29); for solubility, density, b.p., vapor/liq. equil., etc., of system \bar{C} + kerosene see (30); for sepn. of \bar{C} from butane by azeotropic distn. with SO₂ see (31).]

[For soly. in \bar{C} of anhydrous FeCl₃ (33) (34) or anhydrous AlCl₃ (35) (36) see indic. refs.] Adsorption of \bar{C} . [For studies on adsorption of vapors of \bar{C} by activated carbon at -15° (37), 0° (37) (38), 20° (37), 25° (39), or 50° (40) see indic. refs. and also (41); for sepn. of \bar{C} from ethylene + HCl gas by adsorption on carbon see (42). — For adsorption of vapors of \bar{C} by dehydrated chabasite see (43).]

Inflammability of \bar{C} or its mixtures. \bar{C} is readily inflammable; in mixts. with air explosive range conts. 4.00–14.18 vol. % \bar{C} with minimum ignition temp. 517°C. (44) cf. (47) (48); in mixts. with O₂ explosive range conts. 4.05–67.2 vol. % \bar{C} (44) (45) with min. ignition temp. 468°C.; in mixts. with N₂O explosive range conts. 2.1–32.8 vol. % \bar{C} (45) cf. (46); for study of explosion range of \bar{C} + C₂Cl₂F₂ ("Freon") + air or \bar{C} + butane + air see (49). — See also below under use of \bar{C} as anesthetic.

Other miscellaneous physical props. [For study of thermal conductivity of \bar{C} see (50).] Binary systems contg. \bar{C} . [For f.p./compn. data and diagram of system \bar{C} + methylene (di)chloride (3:5020), eutectic, f.p. -149.7° , contg. 68.3 wt. % \bar{C} , see (18); for f.p./compn. data and diag. of system \bar{C} + EtBr (note no eutectic is formed) see (18); for system \bar{C} + solid CO₂ see (8).]

TOXICITY AND PHYSIOLOGICAL ACTION OF C

Full treatment of this topic is beyond the scope of this work; however, for lead references on its pharmacology (51), toxicity (52) (53) (54) (55), or anthelmintic props. (56) see indicrefs. — For use as narcotic and anesthetic see below.

USES OF C

Use for anesthesia and narcosis. [For general reviews on use of \bar{C} as anesthetic see (57) (58) (59) (60); for use of \bar{C} as dental anesthetic see (61) (62) (63); for short narcosis see (64) (65). — For data on mortality from use of \bar{C} as anesthetic see (66). — For studies of explosion hazards with \bar{C} or \bar{C} + ether (67) especially in presence of X-ray apparatus (68) see indic. refs. (see also above under inflammability of \bar{C}).]

Use as a refrigerant. \tilde{C} either alone or mixed with other cpds. is often used in refrigerating systems: e.g., for general survey of this aspect see (21); for examples of patents on use in refrigerating systems of \tilde{C} (70), of \tilde{C} (96%) + MeCl (4%) (3:7005) (71), of \tilde{C} (25%) + methylene (di)chloride (3:5020) (75%) (72), of \tilde{C} (40%) + EtBr (60%) (72), of \tilde{C} + an alc. + a hydrocarbon lubricant (74) see indic. refs. — For study of use of \tilde{C} with other suitable liq. in low-temp. cryostats see (18).

Use as solvent for extraction of oils. For use of \bar{C} as extremely volatile solvent for extraction of oils, fats, resins, perfumes, etc., see (75) (76) (77).

Miscellaneous uses of $\tilde{\mathbf{C}}$. $\tilde{\mathbf{C}}$ is now an important raw material in the prepn. of tetraethyllead for use as an anti-knock agent in gasoline; for further details see below under chem. behavior of $\tilde{\mathbf{C}}$ toward metals.

[For use of C in purification of metallic mercury see (78).]

Because of its inertness toward ozone, its availability, and its low b.p., Č is often used as solvent for ozonolysis.

DETERMINATION OF C

For detn. of \bar{C} by pyrolytic dissociation at 900° into ethylene and HCl, followed by detn. of chloride ion with stand. AgNO₃ (42) (80) cf. (81) or by combustion with O₂ in an explosion pipet to yield H₂O, CO₂ + HCl (47), see indic. refs. — For detn. of \bar{C} by hydrolysis with excess std. N/2 alc. KOH in s.t. at 120° for 15 min. and back titration with N/2 HCl see (79).

For detn. of \tilde{C} in CHCl₃ (3:5050) see (82); for detection of \tilde{C} in perfumes see (83). For further aspects of identification of \tilde{C} see below under \mathfrak{D} .

PREPARATION OF C

Č can be prepared from various sources and by many methods (see amplification below); however, for quick laboratory methods the most convenient are those from EtOH by htg. with AlCl₃ (1 mole) at 150° (97.6% yield (13)) and from diethyl sulfate with aq. CaCl₂ (63% yield (84)).

From ethyl alcohol (1:6130).

With hydrogen chloride or hydrochloric acid. [For prepn. of \bar{C} from EtOH by reactn. with HCl in absence of cat. under reflux (85) (86) or at 125° and 16 atm. (87), or 140° and 24 atm. (88), see indic. refs.; for use of EtOH + liq. HCl see (89).]

For prepn. of C from EtOH with conc. HCl in pres. of ZnCl₂ (60% yield (7) (91)) see articles represented by (90) (7) (91) (92) (93) [for patents (often including also other metal salt cat. such as BiCl₃, etc.) see (94)-(102), incl.].

[For prepn. of \tilde{C} from EtOH + HCl in pres. of H₃PO₄ (103) (104) (105) or H₂SO₄ (106) or EtHSO₄ (107) see indic. refs.]

By use of metal salts. For prepn. of \tilde{C} from EtOH by use of AlCl₃ at 150° (97.6% yield (13)) or of aq. FeCl₃ at 80° (108), or by reflux with subl. FeCl₃ for $1\frac{1}{2}$ hrs. (86% yield (112)), see indic. refs.

By use of inorganic acid chlorides. For prepn. of \bar{C} from EtOH by use of PCl₃ (43% yield (109)), PCl₃ + ZnCl₂ (62% yield (91)), PCl₅ + ZnCl₂ (70% yield (91)), SOCl₂ + pyridine (75% yield (91)), or SO₂Cl₂ + pyridine (110) see indic. refs.

By use of organic acid chlorides. [For prepn. of \bar{C} from EtOH with benzotrichloride (3:6540) + FeCl₃ see (111).]

From diethyl ether (1:6110).

By cleavage with HCl + a catalyst. [For prepn. of \tilde{C} from diethyl ether with $HCl + ZnCl_2$ (113) at 80–280° under press. (114) or at 300–370° under press. (115), or with $HCl + AlCl_3/NaCl/FeCl_3$ at 200–325° (116), or with HCl + a nitrogen heterocycle (117) see indic. refs.]

By cleavage with acid chlorides + a catalyst. [For prepn. of \tilde{C} from diethyl ether with SOCl₂ or S₂Cl₂ in pres. of SnCl₄ or TiCl₄ (118); or with SOCl₂ + ZnCl₂ (119); or with benzoyl chloride (3:6240) in pres. of Zn (120) cf. (121), ZnCl₂ at 150° (78% yield (122)) cf. (123) (124), MeZnI (125) or AlCl₃ (126); or with phthalyl (di)chloride (3:6900) in pres. of ZnCl₂ at 170° (80% yield (122)); or with acetyl chloride (3:7065) in pres. of ZnCl₂ (127) or AlCl₃ (126) see indic. refs.]

[For form. of \bar{C} from diethyl ether + CHCl₃ (3:5050) + cat. at 290° and 25 atm. see (128).]

From various ethyl esters of inorganic and organic acids. [For prepn. of \bar{C} from diethyl sulfate with aq. CaCl₂ as lab. method (63% yield (84)) or as manufacturing process (129); from diethyl sulfate with conc. IICl at 140° and 24 atm. (130); from ethyl chlorosulfonate with fumg. HCl at 100° (91% yield (131)) (132) cf. (189), pyridine (133), or di-n-butylamine at 100° (53% yield (134)) see indic. refs]

[For prepn. of \bar{C} from ethyl formate (1:3000) with AlCl₃ (1 mole) at 110° (82% yield (135)); from ethyl chloroformate (3:7295) on htg. at 250° (for study of this reaction see (136) (137)), with dimethylaniline at 150° (138), with pyridine (139), with quinoline at 100° (139) or even 59° (140) (141), or with AlCl₃ at room temp. (142), or with EtHSO₄ (143) see indic. refs.]

[For prepn. of C from ethyl acetate (1:3015) with subl. FeCl₃ on 1½ hrs. reflux (73% yield (112)), or with SiCl₄ (144), from ethyl benzoate (1:3721) with subl. FeCl₃ on 1½ hrs. reflux (74% yield (112)); or from diethyl phthalate (1:4331) with phthalyl (di)chloride (3:6900) + trace ZnCl₂ at 130° (145) see indic. refs.]

From vinyl chloride (3:7010). [For prepn. of C from vinyl chloride by cat. hydrogenation at elev. temp. and press. see (146).]

From ethane. [For prepn. of \bar{C} from ethane with Cl_2 above 290° in pres. of ethylene or PbEt₄ as cat. (yields 67.8–71.4% (147)) (148) see indic. refs. — For examples of other patents on prepn. of \bar{C} from ethane with Cl_2 in pres. of various cat. (149) (150) (151) (152) (153) see indic. refs.]

From ethylene. The preparation of \bar{C} from ethylene by catalytic addn. of hydrogen chloride has been extensively studied both in the scientific and in technical literature. At very low temperatures, the catalyzed reaction is quantitative, but as the temperature is increased the reverse reaction (dissociation of \bar{C} into ethylene and HCl) is favored.

[For studies on the prepn. of \tilde{C} from ethylene with HCl in pres. of AlCl₃ or BiCl₃ at -78° (100% yield (3) (155)), or as high as -12° (95% yield (154) (155)) or 130° (37% yield (42)), see indic. refs.; for studies on equilibrium at 114° and 124° (156), at 170°, 200°, and 230° (157) or for calcn. of entropy of system (158) see indic. refs.; for study of various cat. see (159).]

[The patent literature on prepn. of C from ethylene + HCl is extensive and overlapping, but illustrative examples may be cited. For patents involving use of AlCl₃ (160) (161) under pressure (162) (163) (164) (165) in the pres. of a solvent (often C itself) (162) (166) (167) (168) (190) see indic. refs. — For use of ethylene + mixt. of HCl (90%) + Cl₂ (10%) + AlCl₃ (169) (170) or for prepn. (171) or revivification (172) of AlCl₃ cat. see indic. refs.]

[For patents on prepn. of \bar{C} from C_2H_4 + HCl with various cat., e.g., with BiCl₃ (173) (174) (175), with anhydrous EtHSO₄ (176), with SnCl₄ on activated carbon at 150° (177), with bauxite cat. (178), with iron oxide cat. at 50° and ord. or increased press. (179), with BaCl₂ at 250° (180), with FeCl₃ in \bar{C} or AlCl₃ in nitrobenzene (181), with ZnCl₂ on activated carbon, silica gel, etc., (182) (183), with various surface agts. (184) (185), with SO₂ (186), with 90% H₂SO₄ + NaCl (188), or in liq. ethyl chlorosulfonate + BiCl₃ (189) see indic. refs.]

[For purification of C obtd. from techn. gases by HCl method see (187).]

From miscellaneous sources. [For formn. of \bar{C} from EtBr with CHCl₃ (3:5050) in pres. of AlCl₃ at 50° (191), from EtMgBr during reaction with S₂Cl₂ (192) or with 1,2-dichloroethylene (3:5030) (193), from EtI with Hg₂Cl₂ in s.t. at 140° (12), from ethyl α,β -dichlorovinyl ether (3:5540) with Cl₂ at ord. temp. followed by warms. or stdg. in absence of aq. (194), or from dichloroacetaldehyde diethylacetal (3:6110) with ZnEt₂ (195) see indic. refs.]

[For formn. of C from succinic acid (1:0530) with aq. FeCl₃ in sunlight (196) or from MeCl (3:7005) + aq. by disproportionation over cat. at 200-275° (197) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Pyrolysis of C

 \tilde{C} passed through plain tube at 410° is largely unchanged, but \tilde{C} passed at 550° through tube contg. pumice (198) cf. (42) or other cat. (199) dissociates completely into ethylene + HCl (use in detn. of \tilde{C} (42)).

BEHAVIOR OF C WITH INORGANIC REACTANTS

Chlorination. [\bar{C} with liq. Cl₂ (1 mole) in u.v. light and cooling yields (200) mainly 1,1-dichloroethane (3:5035) accompanied by some 1,2-dichloroethane (3:5130) and higher chlorination prods.; the two dichloroethanes are also obtd. from \bar{C} with Cl₂ + aq. (201). — For very impt. study of behavior of \bar{C} with Cl₂ at 202-380° see (202) (147).]

[\bar{C} with SbCl₅ in s.t. at 100° (203) or \bar{C} with NCl₃ (204) yields 1,2-dichloroethane (ethylene dichloride) (3:5130).]

Bromination. [For behavior of C with Br₂ see (207) (208).]

Fluorination. [C at 900° with F₂ in pres. of Cu yields (205) CF₄, CF₃Cl, CF₃.CF₂Cl, CHF₂.CH₂Cl, CF₂—CCl₂, and other prods.]

Hydrogenation. [For behavior of C with atomic hydrogen see (206).]

Hydrolysis. [C over suitable partially dehydrated Al(OH)₃ at room temp. (209), or C + aq. vapor over cat. at 300-500° at ord. press. (210) (211) (212), or C with aq. NaOH above 150° under press. (213), or C with alc. NaOH (214), alc. Na₂CO₃, MgO, or CaOe (215) is saponified yielding EtOH (1:6130). — The reaction of C with EtOH/KOH is bimolecular (216); furthermore during hydrol. of C with alk. some diethyl ether is always formed cf. (213) (214) and the reaction may be adapted to its prepn. (217).]

Amination. [C with alc. NH3 in s.t. at 100° (218) or C with liq. NH3 at 220° and 220 atm. press. (219) gives salts of ethylamine, diethylamine, triethylamine, and other prods.—

 \tilde{C} with NaNH₂ in liq. NH₃ at 0° and 20 atm. gives ethylamine (30% yield (220)) and ethylene.

Behavior of \tilde{C} with inorganic acids. [\tilde{C} passed through boilg. H_2SO_4 gives $C_2H_4 + SO_2 + HCl$; \tilde{C} is absorbed by SO_3 giving a liq. which probably comprises a mixture of ethyl chlorosulfonate, β -chloroethanesulfonic acid, and β -hydroxyethanesulfonyl chloride (221).]

Behavior of C with inorganic salts. [For study of rate of reaction of C with KI in acetone at 50° and 60° see (222). — C with AlBr₃ under suitable cond. yields (223) ethyl bromide.]

Behavior of $\tilde{\mathbb{C}}$ with metals. With sodium. The most important reaction of $\tilde{\mathbb{C}}$ with metals is that involved in the manufacture of tetraethyllead for use as an anti-knock agent in motor fuels. Tetraethyllead is prepared for $\tilde{\mathbb{C}}$ either by direct reaction with Na/Pb alloys, or by reaction with Mg and subsequent conversion of the EtMgCl by means of PbCl₂. For a general survey (without references) on the manufacture of tetraethyllead see (224).

For patents involving the prepn. of Et₄Pb from \bar{C} by reactn. with Na/Pb alloys under various circumstances see (225)-(244) incl.; for patents involving the use of EtMgCl see (245)-(248) incl.

[For behavior of \bar{C} with Na in lgr. followed by CO₂ (249) or with amyl-sodium or octyl-sodium (250) see indic. refs. — \bar{C} with K/Na alloy in xylene gives (251) ethane (32%) and ethylene (5.5%). — \bar{C} with Tl/Na yields (252) TlEt₃.]

With magnesium. [\bar{C} with Mg in s.t. at 260° for 4 hrs. gives (253) gas (consisting of 45% butane + 20% olefins + 22% H₂) and a white solid which with aq. gives a gas contg. 86% H₂ + 13% ethane.]

 \bar{C} with Mg in dry ether in absence of air and in pres. of trace of I₂ gives (99.7% yield in 4 hrs. (254)) EtMgCl; this reagt. is actually an equil. mixt. contg. 25% EtMgCl + 42.5% MgCt₂ + 42.5% MgCl₂ (255). — For study of competitive reaction with Mg in ether of an equimolar mixt. of \bar{C} + EtI yielding 27% EtMgCl + 73% EtMgI see (256). — [For reactn. of EtMgCl with NH₄Cl or triethylamine.HCl (254), with NH₂Cl (257), or with NCl₃ (258) see indic. refs.; for study of electrolysis of EtMgCl in ether see (259). — For reactn. of EtMgCl with PbCl₂ yielding PbEt₄ see (245)–(248) incl.; with C₆H₅NCO yielding propionanilide see below under \bar{D} 's.]

BEHAVIOR OF C WITH ORGANIC REAGENTS

[\bar{C} with C_6H_6+Al/Hg gives (76% yield (260)) ethylbenzenc (1:7410); \bar{C} + hexane + AlCl₃ gives (261) octane.]

[\bar{C} with CO + AlCl₃ at 40-50° and 120 atm. followed by treatment with H₂O gives (43% yield (262)) (263) propionic acid (1:1025).]

[Č with ethylene oxide $(1:6105) + AlCl_3$ gives (264) a mixt. contg. 4-chlorobutanol-1 (3:9170) + ethylene chlorohydrin (3:5552).]

[C may be used for the ethylation of OH groups or NH₂ groups: e.g., for reaction of C with sodium phenolate yielding (265) ethyl phenyl ether (1:7485) or for use of C in ethylation of cellulose (266) (267) see indic. refs.; for use of C in ethylation of metanilic acid (268) (214) (215), o-toluidine (269), or m-aminophenol (268) see indic. refs.]

[For condens. of C with hexamethylenetetramine see (270).]

[C (2 moles) with ethylene (di)bromide (1 mole) + 3% AlCl₈ in steel bomb at 25° for 14 days undergoes a redistribution reactn. yielding (271) a mixt. consisting of 5 cpds., viz., C (35 mole %) + EtBr (30 mole %) + ethylene chlorobromide (17 mole %) + ethylene (di)bromide (11 mole %) + ethylene dichloride (3:5130) (7 mole %).]

[C (1 mole) with quinoline (1 mole) in s.t. in direct sunlight reacts only very slowly (incomplete in 1 year) but grad. separates ethylquinolium chloride, cryst. from abs. EtOH by addn. of dry ether, m.p. 122° (290).]

- **Propionanilide:** m.p. 104.0-104.5° u.c. (272). (See also under propionic acid (1:1025).) [From \bar{C} by conversion to EtMgCl (see above) and reactn. in dry ether with phenyl isocyanate (272).]
- —— Propion-p-toluidide: m.p. 123°. [Presumably obtainable (272) from C via conversion to EtMgCl (see above) and reaction in dry ether with p-tolyl isocyanate.]
- Propion- α -naphthalide: m.p. 126° u.c. (273). [Presumably obtainable (272) from $\bar{\mathbf{C}}$ via conversion to EtMgCl (see above) and reaction in dry ether with α -naphthyl isocyanate; the analogous process for EtBr has been reported (273).]
- Ethyl mercuric chloride: m.p. 193.5° cor. (274), 192.5° (275), 192° (276). [Prepd. indirectly (276); but should be preparable from EtMgCl with HgCl₂ since corresp. EtHgBr has been reported (276) from EtMgBr + HgBr₂. Note that m.p. of EtHgCl is almost identical with that (193.5°) of EtHgBr cf. (276).]
- ---- N-Ethylphthalimide: [Beil. XXI-461, XXI₁-(363)], ndls. from alc., m.p. 79° (279), 78° (280). [Prepd. indirectly (280), also from EtI with potassium phthalimide in s.t. at 150° (279).]
- —— N-Ethyl-3-nitrophthalimide: pl. from CS₂, m.p. 105-106° (281) (282); for photographs of crystals see (282). [Not reported from C itself, but obtd. from EtBr with K phthalimide on protracted reflux. (281).]
- N-Ethyltetrachlorophthalimide: pl. from CHCl₃ on pouring into 2 vols. EtOH, m.p. 192-193° (283). [Not reported from C but obtd. from EtBr or EtI with K tetrachlorophthalimide in s.t. at 200° for 6 hrs. (283).]
- —— N-Ethylsaccharin: cryst. from dil. alc., m.p. 94° (284). [This prod. cannot be obtd. from C itself (284) but is obtd. from either EtBr or EtI with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 30 min. (284).]
- ---- N-Ethyl-N-(p-bromobenzenesulfonyl)-p-anisidide: m.p. 113.5° u.c. (285). [Not reported from \(\bar{\chi}\) but obtained from EtBr with N-(p-bromobenzenesulfonyl)-p-anisidide (285).]
- —— p-Ethoxybenzoic acid: m.p. 195° (286) cf. (287).
- ---- Ethyl 2.4.6-triiodophenyl ether: m.p. 83.5° cor. (288).
- Ethyl α-naphthyl ether: oil, b.p. 280.5° cor., f.p. below -10° (289). (Corresp. picrate, m.p. 118.5-119.5° cor.; Neut. Eq. 401 (289).)
- Ethyl β-naphthyl ether: m.p. 35.5-36.0° cor., b.p. 282° cor. (289). (Corresp. picrate, m.p. 101.0-101.5° cor., Neut. Eq. 401 (289).)

3:7020 2-CHLOROPROPENE-1 Cl
$$C_3H_5Cl$$
 Beil. I - 198 (Isopropenyl chloride α -methylyinyl chloride) CH_2 -C=CH₂ I_{1-} (169)

B.P. F.P. 22.65° at 760 mm. (1)
$$-138.6$$
° (2) $D_9^9 = 0.918$ (5) $n_D^{20} = 1.3949$ (4) 22.6° at 760 mm. (2) -137.4 ° (1) 22.5-23.5° at 760 mm. (3) 21.7-21.8° at 743 mm. (4)

[For prepn. of \bar{C} (45%) together with 2,2-dichloropropane, b.p. 70° (3:7140) (55%), from acetone (1:5400) + PCl₅ see (6) (7) (9); from 2,2-dichloropropane (3:7140) + alc. KOH (3) or KOAm in AmOH (10); for prepn. of \bar{C} (together with 1-chloropropene-1 (3:7030)) from 1,2-dichloropropane (3:5200) + alc. KOH see (11) (12) (13); for prepn. of \bar{C} together with cyclopropane (b.p. -34°) from a mixt. of 1,3-dichloropropane (3:5450) + 1,2,2-trichloropropane (3:5475) on treatment with Zn see (14).]

 \bar{C} with MeOH forms a const.-boilg. mixt., b.p. 22.0°, contg. 97% \bar{C} + 3% MeOH (15). \bar{C} treated with conc. H₂SO₄ and (after evoln. of HCl has ceased) poured into much aq. and steam-distd. (16) or \bar{C} htd. with 10 vols. aq. in s.t. at 140–180° (17) yields acetone (1:5400) q.v.

 \bar{C} adds Br_2 yielding (8) (12) 2-chloro-1,2-dibromopropane [Beil. I-111], b.p. 169–170° cor. (12).

 $\bar{\rm C}$ adds HBr fairly readily; in the presence of air or of antioxidants in vacuo, the product is pure 2-chloro-2-bromopropane, b.p. $91.0-92.0^{\circ}$ at 740 mm., $34.6-34.8^{\circ}$ at 100 mm., $n_{\rm D}^{20}=1.4575$ (4); in the presence of organic peroxides the major reactn. prod. is 2-chloro-1-bromopropane, b.p. $117.6-118.0^{\circ}$ at 740 mm., $52.2-52.8^{\circ}$ at 75 mm., $n_{\rm D}^{20}=1.4778$ (4).

3: 7022 ETHYL HYPOCHLORITE

CH₃.CH₂OCl

C₂H₅OCl

Beil. I - 324 I_{1} -(164)

 I_{2} -(325)

B.P. 36° at 758 mm. (1) 36° at 752 mm. (2) $D^{-6} = 1.013 (1)$

[See also ter-butyl hypochlorite (3:7165).]

Colorless oil (rapidly turning yellow in light) with odor like hypochlorous acid. — Č explodes on superhtg, its vapor or even in cold upon addn, of Cu powder or in bright sunlight — C gradually decomposes on stdg. in diffuse light with forms. of ethyl acetate and other prods. (3) (4) (10). [For study of stability of \bar{C} in aq. or in CCl₄ soln. see (4).] — Sol. ether, C₆H₆, CHCl₃; for distrib. of C between aq. and CCl₄ see (4).

[For prepn. of C from EtOH (1:6130) with Cl₂ in cold aq. alk. (2) (5) (1) (6) (7) (8) (9) or alk. earth (9) or with aq. HOCl in pres. of CCl4 (4) see indic. refs.; for formn. of C from EtOH (1:6130) with Cl_2 at -18° (8) or with dry $Ca(OCl)_2$ (15) or aq. HOCl (15) (16) see indic. refs.

Č is able according to prevailing circumstances to act as an oxidizing agent, chlorinating agent, or for addn. to unsaturated linkages: furthermore since in aq. C is extensively hydrolyzed (69% in sat. aq. soln. (4)) it may serve as source of HOCl; examples of these reactions are given below.

 $\bar{\mathbf{C}}$ with inorganic reactants. $\bar{\mathbf{C}}$ with KI + AcOH liberates I₂ quant, according to the equation $C_2H_5OCl + 2HI \rightarrow C_2H_5OH + HCl + I_2$ (use in quant. detn. of \bar{C} (2) (4) (7)); C with dil. alk. Na₃AsO₃ gives (11) (12) EtCl (3:7015) + Na₃AsO₄; C in dil. alk. KSH/ KCN mixt. gives (12) KSCN + KCl + EtOH.

[C adds to dry SO₂ yielding (5) ethyl chlorosulfonate [Beil. I-327, I₂-(327)], b.p. 151-154° $\operatorname{dec.}, n_{\mathbf{D}}^{18} = 1.4174.$

 \sqrt{C} (1 mole) with KCN (2 moles) in 7 pts. aq. at -5° gives (30% yield (13)) ethyl cyanoiminoformate [Beil. II-549, II₁-(238), II₂-(511)], oil, b.p. 133° dec., accompanied by a little diethyl di-imino-oxalate [Beil. II-547, II₁-(238)], m.p. 38°, b.p. 172° strong dec.; in aq. alc., however, the same components give (13) diethyl iminocarbonate [Beil. III-37, III₁-(18), III₂-(31)], oil, b.p. 141° cor., accompanied by diethyl di-iminooxalate (see above),

C with organic reactants. [C with EtOH (1:6130) yields (8) acetaldehyde (1:0100). acetaldehyde diethylacetal (1:0156), and paraldehyde (1:0170). — \tilde{C} with acetaldehyde (1:0100) at 0° followed by distn. of the mixture with anhyd. oxalic acid yields (3) chloroacetaldehyde (3:7212).]

IC with acetone (1:5400) yields (3) chloroacetone (3:5425); C with methyl phenyl ketone (acetophenone) (1:5515) yields (3) ω-chloroacetophenone (phenacyl chloride) (3:1212); Č with benzaldehyde (1:0195) yields (3) benzoyl chloride (3:6240),]

[C with phenol in CCl4 yields (3) both o-chlorophenol (3:5980) and p-chlorophenol

(3:0475); Č with hydroquinone (1:1590) in ether gives (3) 2,3-dichlorohydroquinone (3:4220).

Č with phenyl MgBr in ether at 0° gives (60% yield (14)) (1) chlorobenzene (3:7903). [Č with phenylacetylene (1:7425) in CCl₄ yields (3) ω,ω-dichloroacetophenone (3:6835).] [Č with cyclohexene (1:8070) in CCl₄ yields (3) 2-chlorocyclohexanol-1 (3:0175); for reactn. of Č with indene (1:7522) or with 1.4-dihydronaphthalene see (3).

[\bar{C} with olefins adds to the unsatd. linkage to give chlorohydrin ethyl ethers (a process now generically designated as chloroalkoxylation): e.g., \bar{C} with ethylene yields (15) (17) β -chloroethyl ethyl ether (ethylene chlorohydrin ethyl ether) (3:7463); \bar{C} with amylene gives (3) a corresp. prod.; the rate of addn. of \bar{C} to olefins increases from ethylene to amylene (18). — For extensive studies on the prepn. of chlorohydrin ethers from olefins by use of alcs. + N,N-dichlorobenzenesulfonamide (which mixture appears to generate ROCl as the active addn. agent) see (18) (19) (20) (21).]

[\bar{C} has, however, but slight tendency to add to unsaturated acids: e.g., \bar{C} in CCl₄ has no actn. (22) on cinnamic acid (1:0735); \bar{C} in dry ether or CCl₄ with crotonic acid (1:0425) or sorbic acid gives only traces (23) of the expected prods. — \bar{C} in CCl₄ with hexen-3-oic acid-1 (hydrosorbic acid) [Beil. II-435, II₁-(193), II₂-(404)] gives addn. to extent of 92% in 3 days (23), but the prod. is not a chloro-ethoxy-hexanoic acid and consists entirely of a mixt. of two stereoisomeric β -chlorohexanoic lactones.]

3: 7030 1-CHLOROPROPENE-1 H
$$C_3H_5Cl$$
 Beil. I - 198 (Propenyl chloride, β -methylvinyl chloride) CH₃. CH= C C_1

trans form

B.P. F.P. 37.4° at 760 mm. (1)
$$-99^{\circ}$$
 (1) $n_{\rm D}^{20} = 1.4054$ (2) 36.7° at 747 mm. (2)

cis form

B.P. F.P.
$$n_{\rm D}^{20} = 1.4053$$
 (2) $n_{\rm D}^{20} = 1.4053$ (2) $n_{\rm D}^{20} = 1.4053$ (2)

Mobile colorless liq. lighter than water (3). $\ddot{\mathbf{C}}$ is stable toward hydrolysis; for use in anal. of mixts. of $\ddot{\mathbf{C}}$ with 3-chloropropene-1 (allyl chloride) (3:7035) see (7).

[For prepn. of \bar{C} from 1,1-dichloropropane (3:7230) + alc. KOH in s.t. at 100° (3) (4) or with alc. NaOEt (2) see indicated refs.; for formn. from 1,2-dichloropropane (propylene dichloride) (3:5200) + alc. KOH see (3) (5) (\bar{C} is principal product (5), but some 2-chloropropene-1 (3:7020) and propadiene are also formed); for formn. of cis isomer from α,β -dichloro-n-butyric acid of m.p. 62.5-63° by warming with Na₂CO₃ see (6).]

 \ddot{C} with Br₂ at -15° yields 1-chloro-1,2-dibromopropane, b.p. 177-177.5° cor. (3).

 $\bar{\mathbf{C}}$ in presence of air or added peroxides adds HBr rapidly to give exclusively (2) 1-chloro-2-bromopropane, b.p. 117.2-117.3° at 740 mm., 52.0° at 75 mm., $n_D^{20} = 1.4795$ (2).

[For study of molecular refraction and dipole moment of both cis and trans forms of C see (8).]

Colorless oil, spar. sol. aq.; volatile with steam.

Č with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 44° at 760 mm., contg. 95% Č (5); with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 45.0° at 760 mm., contg. 92.5% Č (15).

C is one of most toxic of all halohydrocarbons (for study see (16)).

[For prepn. of Č from allyl alcohol (1:6145) on satn. at 0° with HCl gas and htg. in s.t. at 100° for 3 hrs. (17), with conc. HCl (2 moles) in s.t. 15 hrs. at 100° (78% yield (3)) cf. (1) (23) or 10 days at room temp. (55-65% yield (18)), on distn. with large excess (16 pts.) 6 N HCl (50% yield (19)), with ZnCl₂ + HCl gas at 75-82° (yield: 60% (20), 58% (21)), or dislvd. in cold conc. HCl and treated with Cu₂Cl₂ (small amt.) + conc. H₂SO₄ (yield 85-90% (2), 80% (22)) see indic. refs.; from allyl alcohol (1:6145) with SOCl₂ in CaH₈

(71% yield (21)), with PCl₃ (1) (24), with PCl₃ + ZnCl₂ in C_6H_6 at 0° (63% yield (21)), with PCl₅ + pyridine (73% yield (9)), with PCl₅ + ZnCl₂ in C_6H_6 (57% yield (21)) see indic. refs.]

[For prepn. of \bar{C} from allyl formate (1:3035) with conc. HCl + a little Cu₂Cl₂ + conc. H₂SO₄ (93–98% yield (22)), or with ZnCl₂ + HCl gas (80–90% yield (25)) (26) see indic. refs.; from allyl oxalate in alc. CaCl₂ in s.t. at 100° see (27); from allyl iodide with alc. HgCl₂ at ord. temp. see (27).]

[For comml. prepn. of $\bar{\rm C}$ from propylene with Cl₂ at elevated temps., e.g., 500° (yield 96% $\bar{\rm C}$ accompanied by 3% 2-chloropropene-1 (3:7020) + 1% mixed cis and trans isomers of 1-chloropropene-1 (3:7030) (11)) (28) (29), see indic. refs. (note also that the high-boiling material from distn. of comml. $\bar{\rm C}$ contains (110) approx. 60% 1,3-dichloropropene-1 (3:5280) + 30% 1,2-dichloropropene (3:5200)); for examples of patents covering this procedure see (30) (31) (32) (33) (34) (35); from propane (34) (36) or 1-chloropropane (3:7040) (36) with Cl₂ + cat. at 500-700° see indic. refs.; from 1,2-dichloropropane (3:5200) by suitable pyrolysis (yield: 55-70% $\bar{\rm C}$ + 30-40% of mixt. of cis and trans isomers of 1-chloropropene-1 (3:7030) + 5% 2-chloropropene-1 (3:7020) (11)) cf. (12) (13) (39); for examples of relevant patents see (37) (38) (40).]

Reactions involving the double bond of \bar{C} . [\bar{C} with Cl_2 adds and/or substitutes according to conditions (for study of relative proportions of these reactions see (29) (11)); \bar{C} with Cl_2 at ord. temp. (41) or \bar{C} with SO_2Cl_2 in CCl_4 in pres. of peroxides (42) gives (80–90% yield (42)) 1,2,3-trichloropropane (3:5840) (note that this comprises one step in one of the modern syntheses of glycerol from petroleum (43) (44)); \bar{C} with Cl_2 at high temp. yields (11) a mixt. of prods. of which the dichloropropene fraction comprises (11) 47% 1,3-dichloropropene-1 (high-boilg. isomer) (3:5280) + 42% 1,3-dichloropropene-1 (low-boilg. isomer) (3:5280) + 11% 1,1-dichloropropene-2 (3:5140) + trace of 1,2-dichloropropene-2 (3:5190).]

[\bar{C} with Br₂ adds 1 mole of halogen yielding (45) mainly 1,2-dibromo-3-chloropropane (γ -chloropropylene dibromide) [Beil. I-111], b.p. 195° (45); for study of rate of addn. of Br₂ under various conditions see (14) (9) (46) (105); for heat of reactn. see (47).]

[\bar{C} with conc. aq. HCl in s.t. at 100° for 18 hrs. (48), or \bar{C} with dry HCl in dark at 0° in absence of FeCl₃ (33% yield (49)) or at room temp. in pres. of FeCl₃ (85–89% yield (49)), gives 1,2-dichloropropane (propylene dichloride) (3:5200); note that addn. of HCl is not complicated by a peroxide effect but is very slow unless FeCl₃ (or less advantageously AlCl₃) is used as a cat. (49). — \bar{C} satd. with HBr gas at 0° or below (50), or with conc. aq. HBr at 0° (51), or with HBr gas in s.t. at 100° for 8 hrs. (48) cf. (52), or in presence of Fe (53) or other cat., e.g., BiCl₃ (54), as directed, gives (yields: 36–38% (53), 43% (52), 50% (51), 87% (50)) 1-bromo-3-chloropropane (γ -chloro-n-propyl bromide) (trimethylene chlorobromide) [Beil. I-109, I₁-(36), I₂-(75)], b.p. 142°; note that the above mode of addn. is favored by peroxides (49) (54) cf. (106). — \bar{C} with HI (10–20% excess at 0°) gives exclusively (90–100% yield (55)) 1-chloro-2-iodopropane, b.p. 66.2° at 50 mm., $n_D^{20} = 1.5472$ (55); note that in this reactn. formn. of 2-iodopropane (isopropyl iodide) has also been reported (56).]

 $[\bar{C}\ (1\ mole)\ with conc.\ H_2SO_4\ (2\ moles)\ at\ 0^\circ\ gives\ an\ oily\ addn.\ prod.\ (24)\ (presumably\ \beta$ -chloroisopropyl hydrogen sulfate) which upon dilution with aq. and subsequent distillation gives (50% yield (57) (61)) (24) (58) (59) (60) 1-chloropropanol-2 (3:7747); in pres. of CuSO_4 the yield rises to 66-70% (62). — \bar{C} adds HOCl yielding (63) (64) (65) (76) 2,3-dichloropropanol-1 (glycerol β -dichlorohydrin) (3:6060). — \bar{C} with ter-butyl hypochlorite (3:7165) in MeOH contg. a little p-toluenesulfonic acid gives at 40° (44% yield (66)) 1,3-dichloro-2-methoxypropane (β , β '-dichloroisopropyl methyl ether), b.p. 154-156° at 730 mm., $D_{-}^{20}=1.2235,\ n_{10}^{20}=1.4542$ (66).]

[\bar{C} with liq. SO₂ + trace of ascaridole + a few drops of aq. or alc. HCl, HBr, or H₂SO₄ gives (70–100% yield (67)) cf. (68) allyl chloride polysulfone, no def. m.p., dec. 210–235°, sol. CHCl₃ or acetone but insol. most other org. solvents; note, however, that this addn. of SO₂ is completely inhibited by the pres. of as little as 5 mole % of allyl bromide or cinnamyl bromide (67). — \bar{C} (2 moles) with S₂Cl₂ (1 mole) in s.t. at 100° for 6 hrs. deposits sulfur and yields (69) bis-(β , γ -dichloro-n-propyl) sulfide, pale yel. oil, b.p. 181–182° at 15 mm. (69); the same components maintained at room temp. for 10 days, however, deposit no sulfur and on distn. yield (69) bis-(β , γ -dichloro-n-propyl) disulfide, b.p. 190° at 11 mm. (69).]

[\bar{C} (2 moles) with cyclopentadiene (1 mole) (1:8030) in s.t. at 170–180° for 8 hrs. gives (74% yield on C_5H_6 (70)) by Diels-Alder addn. 2,5-endomethylene-1,2,5,6-tetrahydrobenzyl chloride (1-(chloromethyl)-2,5-endomethylenecyclohexene-3), b.p. 54–57° at 11 mm. (70). — For polymerization of \bar{C} see (71) (101).]

[\bar{C} with excess diazomethane in ether stood for 3 days yields a yel. very hygroscopic ppt. presumably 3-(chloromethyl)- Δ^2 -pyrazoline (72).]

[\bar{C} with C_6H_6 + conc. H_2SO_4 gives (73) by addn. to the ethylene linkage β-chloro-n-propylbenzene (2-chloro-1-phenylpropane) [Beil. V-391, V₁-(189), V₂-(304)], b.p. 85° at 13 mm., $D_{-}^{19} = 1.047$, $n_{D}^{19} = 1.5245$ (73); note, however, that \bar{C} with C_6H_6 in pres. of FeCl₃ at -20° gives (33.5% yield (74)) (73) the isomeric (β-chloroisopropyl)benzene (1-chloro-2-phenylpropane) [Beil. V₁-(191)], b.p. 79° at 10 mm., $D_4^{17} = 1.0367$, $n_D^{16} = 1.52129$ (74); \bar{C} with C_6H_6 + AlCl₃ (½ mole) gives none of the β-chloroisopropylbenzene since it apparently reacts with more C_6H_6 yielding (74) α-methylbibenzyl (1,2-diphenylpropane [Beil. V-613, V₁-(288), V₂-(517)].] [For analogous condensation of \bar{C} with fluorobenzene, chlorobenzene (3:7903), and bromobenzene see (118).]

[For oxidn. of \bar{C} in liq. phase at 75–250° by O_2 in pres. of $Cu(OAc)_2$ or peroxide catalysts and in an org. solv. such as AcOH to hydroxylated cpds. sec (75).]

Reactions involving the halogen atom of \bar{C} . $[\bar{C} + H_2 \text{ over activated charcoal at } 300-500^{\circ}$ gives (58% yield (77)) propylene; note that the double bond is *not* (77) hydrogenated.] $[\bar{C}$ passed over activated charcoal contg. 1-2% KOH is dehalogenated (78) at 375° to extent of 21%; at 400°, 58%.]

[C with aq. vapor at 550-850° + cat. (79) or under press. with alkali hydroxides (80) or with HCl/Cu₂Cl₂(108) yields (cf. (43) (44)) allyl alcohol (1:7145). — C with alc. KOH (81) (107) or alc. NaOH (12) yields allyl ethyl ether (1:7850) + alkali chloride; for use of this reactn. in detn. of C in pres. of cis-1-chloropropene-1 (3:7030) and trans-1-chloropropene-1 (3:7030) see (12); for study of rate of reactn. of C with NaOMe at 16-18° (82) or of C with NaOEt at 35° and 50° (83) see indic. refs.]

[$\ddot{\mathbf{C}}$ with alc. KSH gives mainly (84) di-allyl sulfide [Beil. I-441, I₁-(226), I₂-(478)], b.p. 138-139° (84).] — [For reactn. of $\ddot{\mathbf{C}}$ with alkali polysulfides in propn. of rubber-like prod. see (85).]

[For studies of rate of reactn. of \bar{C} with KI in acetone at 20° (83), 25° (86), or 60° (87) cf. (9) see indic. refs.; for reactn. of \bar{C} with Na₃AsO₃ yielding allylarsinic acid see (88); for reactn. of \bar{C} with CuCN giving (85% yield (22)) allyl cyanide (vinylacetonitrile) [Beil. II-408, II₁-(187), II₂-(389)], b.p. 117.8-118.2° at 757 mm. (22), see indic. refs.; for reactn. of \bar{C} with Mg + acetone, giving allyl-dimethyl-carbinol [Beil. I-445, I₂-(487)], b.p. 118-120°, $D_4^{17} = 0.83452$, $n_D^{17} = 1.4300$ see (89).]

[\tilde{C} with conc. aq. NH₄OH as directed (90) yields allylamine [Beil. IV-205, IV₁-(389), IV₂-(662)], b.p. 56°, misc. aq. — For study of rate of addn. of \tilde{C} to pyridine or reactn. with piperidine see (82) (91); for sepn. of \tilde{C} from other chloro-olefins, e.g., 1-chloropropene-1 (3:7030) or 2-chloropropene-1 (3:7020), by conv. of \tilde{C} to quaternary salt see (111).]

 \dot{C} with Mg in dry ether under carefully regulated conditions gives (84% yield (102))

cf. (109) (119) allyl MgCl; note that if this prod. reacts with phenyl isocyanate in a fashion analogous (103) to allyl MgBr the prod. obtd. should be crotonanilide, m.p. 113-114° cor. (103).

[\bar{C} with Mg in dry ether as directed gives (68% yield crude, 27% pure (92), 60% (93)) hexadienc-1,5 (1:8045). — \bar{C} with NaNH₂ in liq. NH₃ as directed gives (30% yield (94)) hexatriene-1,3,5 [Beil. I-263, I₂-(243)], b.p. 76-80°, $D_4^{20} = 0.7182$, $n_D^{20} = 1.4330$ (94); during the reactn. an intermediate chlorohexadiene (95), b.p. 115° at 748 sl. dec., 46-47.5° at 96 mm., $n_D^{20} = 1.4483$, appears to be formed, and the hexatriene is accompanied (94) (95) by variable amts. of its dimer, trimer, and tetramer. — For reaction of \bar{C} with monosodium acetylene in liq. NH₃ see (96).]

[Č with 1-chloro-2-methylpropene-2 (methallyl chloride) (3:7145) + Mg in ether gives (93) 47% 2-methylhexadiene-1,5 (b.p. 88.1° at 760 mm., $D_4^{20}=0.7198$, $n_D^{20}=1.4184$) + 30% 2,5-dimethylhexadiene-1,5 (b.p. 114.3° at 760 mm., $D_4^{20}=0.7423$, $n_D^{20}=1.4293$) + 12% hexadiene-1,5 (biallyl) (1:8045). — Č with crotyl chloride (the equil. mixt. of 1-chlorobutene-2 (3:7205) and 3-chlorobutene-1 (3:7090)) + Mg in ether gives 34% heptadiene-1,5 (b.p. 93.7° at 760 mm., $D_4^{20}=0.7186$, $n_D^{20}=1.4200$) + 21% 3-methylheptadiene-1,5 (b.p. 111.0° at 760 mm., $D_4^{20}=0.7291$, $n_D^{20}=1.4240$) + 10% hexadiene-1,5 (1:8045) + 10% 3-methylhexadiene-1,5 (b.p. 80.0° at 760 mm., $D_4^{20}=0.7103$, $n_D^{20}=1.4116$) + 1% octadiene-1,6 (b.p. 124.5° at 760 mm., $D_4^{20}=0.7441$, $n_D^{20}=1.4336$) (93).]

[Č reacts with RMgX cpds. in normal coupling; e.g., Č with EtMgBr gives (97) pentene-1 (1:8205); Č with n-PrMgBr gives (97) hexene-1 (1:8255); Č + n-C₅H₁₁MgCl gives (80% yield (93)) octene-1 (1:8375); Č with iso-AmMgCl gives (60% yield (93)) 6-methylheptene-1 (b.p. 113.2° at 760 mm., $D_4^{20} = 0.7119$, $n_D^{20} = 1.4068$); Č with o-tolyl MgBr gives (98) o-allyltoluene (b.p. 182–183° at 757 mm., $D_4^{20} = 0.9001$, $n_D^{20} = 1.5186$).]

Miscellaneous reactions of \bar{C} . $[\bar{C}$ with phenol (1:1420) + conc. H_2SO_4 stood at room temp. for 6 months gives (99) o-isopropenylphenol [Beil. VI-572, VI₁-(283)]; for analogous prods. from \bar{C} with o-cresol (1:1400), m-cresol (1:1730), and p-cresol (1:1410) see (99).]

- S-Allylisothiurea picrate: m.p. 155° (100). [From C thiourea in EtOH, refluxed for 5 min., treated with PkOH (100).]
- —— N-(Allyl)phthalimide [Beil. XXI-464, XXI₁-(364)]: m.p. 70°. [The direct prepn. of this epd. from C has not been reported; it has, however, been obtd. from allyl bromide with K phthalimide in s.t. at 150° for 2-3 hrs. (50% yield (104)) and has also been prepd. by numerous indirect means; with Cl₂ in CHCl₃ it yields N-(β,γ-dichloro-n-propyl)phthalimide, ndls. from alc., m.p. 93° (104); with Br₂ in CHCl₃ it yields N-(β,γ-dibromo-n-propyl)phthalimide, m.p. 113-114° (104).]
- —— N-(Allyl)-3-nitrophthalimide: pl. from CS₂, m.p. 100-101° (112). [Not reported from C but obtd. from allyl bromide with K 3-nitrophthalimide (112); for photographs of cryst. see (113).]
- ---- N-(Allyl)tetrachlorophthalimide: unreported.
- N-(Allyl)-o-sulfobenzoic imide (N-allylsaccharin): m.p. 58° (114). [From C with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (114).]
- —— p-Allyloxybenzoic acid: m.p. 162–163° u.c. (116). [From \bar{C} (?) or from allyl bromide with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (116); note, however, that m.p. of prod. is almost identical with corresp. deriv., m.p. 160–163°, from isopropyl halides.]

- —— Allyl α-naphthyl ether: m.p. -10° (117) (corresp. picrate, m.p. 100.5-101.0° cor. (117)).
- —— Allyl β -naphthyl ether: m.p. +16° (117) (corresp. picrate, m.p. 98.5–99.0° cor. (117).)

Colorless limpid liquid with not unpleasant odor. — Almost insol. aq. [for precise data see (10) (11) (12)].

Č with MeOH, b.p. 64.7°, forms const.-boilg. mixt., b.p. 40.5°, contg. 90.5 wt. % Č (13); Č with EtOH, b.p. 78.3°, forms const.-boilg. mixt., b.p. 45.0°, contg. 94 wt. % Č (14); Č with isopropyl alc., b.p. 82.5°, forms const.-boilg. mixt., b.p. 46.4°, contg. 97.2 wt. % Č (14); Č with CS₂, b.p. 46.3°, forms const.-boilg. mixt., b.p. 42.05°, contg. 44.5 wt. % Č (14).—
[For f.p./compn. data on mixts. of Č with cyclohexyl chloride (3:8040) or with isopropyl bromide see (15).]

reactn. see (30).]

[For prepn. of \bar{C} from propanol-1 (1:6150) with conc. $HCl + ZnCl_2$ (yield: 92% (52); 70–72% (16), 65–70% (17), 61% (18) (19)); with PCl_3 (20) + $ZnCl_2$ (yield: 94% (21) (19)), with PCl_5 (5) + $ZnCl_2$ (76% yield (19)); with $SOCl_2$ + pyridine (84% yield (19)) see indic. refs.; for other misc. methods see Beil.]

[For formn. of \tilde{C} (together with other products) from propane by actn. of Cl_2 see (22) (23); for further actn. of Cl_2 on \tilde{C} see (3) (24) (25); for further chlorination with SO_2Cl_2 see (26).] [For isomerization of \tilde{C} to isopropyl chloride (3:7025) in pres. of metallic cat. see (27) (28); for isomerization of \tilde{C} accompanying alkylation see (29); for \tilde{C} in Friedel-Crafts

 \bar{C} on passing over various cat. espec. at elevated temps. loses HCl (30) (31) + Beil. I₂-(72).

[For study of behavior of \bar{C} with KI see (33); toward Na see (34) (35) (36); with Mg in dry ether see (37) (note that \bar{C} with Mg in dry ether contg. trace of I₂ gives in absence of air 98.2% yield (51) RMgCl).]

- n-Butyranilide: m.p. 96° (38); 97° (39); 92° cor. (40), u.c. (41). [From C (41) or n-propyl bromide (40) via conversion to RMgX and reactn. with phenyl isocyanate (41).]
- —— n-Butyr-p-toluidide: m.p. 75° (38); 74-75° (42); 73-74° (43). [Presumably similarly obtainable via RMgCl + p-tolyl isocyanate, but not actually so recorded.]
- n-Butyr-α-naphthalide: m.p. 120° (44); 121° (45). [From RMgBr via reactn. with α-naphthyl isocyanate (45).]
- ---- n-Propyl mercuric chloride: m.p. 140° (46).
- S-(n-Propyl)isothiourea picrate: m.p. 176° (47). [In small yield from C on htg. 5 hrs. with thiourea in alc., followed by addn. of PkOH (47).]
- —— n-Propyl 2,4,6-triiodophenyl ether: m.p. 82° cor. (48). [From n-propyl bromide on refluxing with 2,4,6-triiodophenol, m.p. 157-158°, in alc. NaOEt (48).] [Note that this ether depresses m.p. of corresp. Et 2,4,6-triiodophenyl ether, m.p. 82° cor. (48).]
- —— N-(n-Propyl)-3-nitrophthalimide: ndls. from CS₂, m.p. 84-85° (49). [From n-propyl bromide on refluxing with K 3-nitrophthalimide (49).]
- —— n-Propyl β-naphthyl ether: b.p. 297.0° cor., m.p. 39.5-40.0° cor. (50) [picrate: m.p. 80.5-81.5° cor. (50)].

[See also 1-chloro-2-methylpropane (3:7135).]

Binary systems of \tilde{C} with other org. cpds. — For f.p./compn. data of mixts. of \tilde{C} with CCl₄ (3:5100) (23) (13), with *n*-butyl chloride (3:7160) (19), with *n*-butyl bromide (19), or with isobutyl bromide (19) see indic. refs.

 $\ddot{\mathbf{C}}$ with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 43.75°, contg. 90% $\ddot{\mathbf{C}}$ (24); $\ddot{\mathbf{C}}$ with formic acid (1:1005) forms a const.-boilg. mixt., b.p. 50.0°, contg. 88.8% $\ddot{\mathbf{C}}$ (3); $\ddot{\mathbf{C}}$ with CS₂ forms a const.-boilg. mixt., b.p. 43.3°, contg. 37% $\ddot{\mathbf{C}}$ (25). — Note that $\ddot{\mathbf{C}}$ gives no azeotrope with ter-BuOH (1:6140) (9).

Preparation of C. [For prepn. of C from ter-BuOH (1:6140) with conc. HCl (3 vols.) by shaking in cold (espec. in pres. of CaCl₂) (78-88% yield (26)) or by distillation (using

7-8 pts. by wt. conc. HCl) (94% yield (27)), or with dil. aq. HCl (18-20 Bé) in pres. of inorg. halide cat. (28) see indic. refs.]

[For prepn. of C from ter-BuOH (1:6140) with dry HCl gas in cold (1) (29), with HCl gas in pres. of pyridine at elevated temp. (some isobutyl chloride (3:7135) is also formed (30)); with PCl₃ (31), PCl₃ + ZnCl₂ (92% yield (32)), PCl₅ (33) (34), PCl₅ + ZnCl₂ (85% yield (32)), or excess AlCl₃ (35); with oxalyl (di)chloride (3:5060) (36) or with trichloromethyl chloroformate (diphosgene) (3:5515) (20) see indic. refs.]

 \bar{C} can also be obtained from various isobutyl cpds. (see following paragraphs), but it must be constantly kept in mind that reactns. of this type involve the equilibrium between \bar{C} , isobutylene, and isobutyl chloride, and the proportions of the two halides may vary widely according to particular conditions; for some types of utilization, however, such a mixture may serve just as well as pure \bar{C} .

[For prepn. of \tilde{C} from 2-methylpropane (isobutane) with Cl₂ see (37) (38) (39); from isobutylene with HCl gas (40) (41) (4) (18), with conc. aq. HCl (42) (43) (44), with HCl gas + AlCl₃ at -50° (45), with HCl gas + cat. (46), from tech. cracked gas (contg. isobutylene) with HCl (47) (48) (49) (57), with chloromethyl methyl ether (3:7085) + HgCl₂ (other prods. are also formed (50)), or even with Cl₂ (other prods. also formed) (51) (52) (53) see indic. refs.]

[For prepn. of \bar{C} from 1-chloro-2-methylpropane (isobutyl chloride) (3:7135) by htg. at 306° (8% \bar{C} (54)), or passing vapor over BaCl₂ at 380-400° (40% \bar{C} (55)), or over suitable cat. at 200° as directed (56); from isobutyl iodide with ICl (58); from isobutylamine with NOCl in xylene at -15° (59); from isobutyl alcohol (1:6165) with HCl gas (60) cf. (1), with HCl gas over Al₂O₃ at 420° (61), or with PCl₃ + ZnCl₂ (62) see indic. refs.]

[For formn. of \bar{C} from 2-chloro-2-methylbutane (ter-amyl chloride) (3:7220) by cleavage with AlCl₃ (35) or with anhydrous HF at 0° (10-17% yield (17)) see indic. refs.]

Pyrolysis of C. [C on suitable htg. dec. into isobutylene + HCl; this begins to occur at 300° even in absence of cat. (63) (for study of equilibria involved see (4) (18)); for study of reactn. over ThO₂ at 100° (64), over pumice at 400-500° (65), or over activated carbon contg. 1-2% KOH (dehalogenation is 19.8% at 375°, 51% at 400° (66)) see indic. refs. — Note that C passed over activated carbon at 400° in pres. of H₂ is 51% dehalogenated but the isobutylene is not reduced (67).]

Further halogenation of $\bar{\mathbf{C}}$. [$\bar{\mathbf{C}}$ in liq. phase with Cl₂ in light gives (68) a mixt. of chlorination prods. contg. approx. 37% 1,2,3-trichloro-2-methylpropane (3:5885) + 25% 1,1,2-trichloro-2-methylpropane (3:5710) + 21% 1,1,2,3-tetrachloro-2-methylpropane (3:6165) + 10% 1,2-dichloro-2-methylpropane (3:7430) + 6% 1,2,3-trichloro-2-(chloromethyl)-propane (3:6335) + a trace of 1,1,1,2-tetrachloro-2-methylpropane (3:4725). $-\bar{\mathbf{C}}$ in vapor phase under reduced press. with Cl₂ in u.v. light or in dark electric discharge (69) or $\bar{\mathbf{C}}$ with SbCl₅ (1 mole) with cooling (34) gives 1,2-dichloro-2-methylpropane (3:7430).]

 \bar{C} with Br₂ in pres. of Fe (70) or in liq. SO₂ at room temp. for 14 hrs. (100% yield (72)) evolves HCl and gives 1,2-dibromo-2-methylbutane (isobutylene dibromide) [Beil. I-127, I₁-(41), I₂-(90)], b.p. 149.0°.

Reactions of the halogen atom of \tilde{C} . The tertiary chlorine atom of \tilde{C} is very reactive and therefore readily hydrolyzed or alcoholized. — \tilde{C} on shaking with aq. for 24 hrs. at room temp. (6) or \tilde{C} on refluxing with 2 vols. aq. for 8 hrs. (71% hydrolysis (72)) yields ter-BuOH (1:6140); note rate of hydrolysis of \tilde{C} is greater in pure aq. than in 5% aq. Na₂CO₃ (72); for use of this facile hydrolysis in removal of \tilde{C} from isobutyl chloride (3:7135) see under latter). [For details of studies of kinetics of hydrol. of \tilde{C} under various circumstances, e.g., in aq. alc., see (73) (74) (75) (6) (11); in formic acid (14) (77) (78).] [For use in prepn. of ter-butyl alc. (1:6140) see (79).]

[\bar{C} (2 moles) in ether shaken with Ag₂CO₃ (1 mole) gives (35% yield {114}) di-ter-butyl ether, b.p. 106.5-107°, $D_4^{20} = 0.7658$, $n_D^{20} = 1.3949$ {114}.]

[C in the presence of small amts. AlCl₃ exchanges halogen with reactive H atoms of certain hydrocarbons; e.g., C with 2,3-dimethylbutane (1:8515) + AlCl₃ shaken for ½ min. at room temp. gives (23% yield (112)) 2-chloro-2,3-dimethylbutane (3:7600); C with 2,2,3-trimethylbutane (1:8544) + AlCl₃ shaken for 30-45 seconds gives (16% yield (112)) 3-chloro-2,2,3-trimethylbutane (3:4020); for other examples see (112).]

[C also undergoes alcoholysis: e.g., C shaken with equal vol. 50 mole % MeOH for several days (74) (11) seps. a non-aq. phase of ter-butyl methyl ether (1:7830), b.p. 55°; C with EtOH gives (11) ter-butyl ethyl ether (1:7860), b.p. 73°; for study of this equilibrium and detn. of these ethers see (11).]

[For rate of reactn. of \bar{C} with KI in acetone at 60° see (80); for reactn. of \bar{C} with Ca formate yielding (77) (78) ter-butyl formate (1:3033), b.p. 83°, see indic. refs.; for conv. of \bar{C} to esters by htg. with alkali salt of a suitable acid under press. at 125-225° in pres. of Cu and the use of this reactn. in sepn. of \bar{C} from less reactive chlorine cpds. see (81).

[$\bar{\mathbb{C}}$ readily condenses with arom. hydrocarbons and phenols: e.g., $\bar{\mathbb{C}}$ with Al/Hg + C₆H₆ gives (74.5% yield (109)) or $\bar{\mathbb{C}}$ with C₆H₆ + AlCl₃ gives (yields: 69% (82), 60% (83)) (62) (1) mainly ter-butylbenzene (1:7460), b.p. 168.8°, often accompanied by some p-(di-ter-butyl)benzene, cryst. from alc., m.p. 77° (82); this same condensation can also be effected in anhydrous HCl at 235° under press. (88% yield (84)) or in anhydrous HF (yield: 60% di- + 10% mono- (85)). $-\bar{\mathbb{C}}$ with toluene + AlCl₃ gives both p-ter-butyl-toluene and m-ter-butyltoluene (in ratio of 30–35/65–70, resp. (86)) but $\bar{\mathbb{C}}$ with toluene in anhyd. HCl or HF (85) (22) cf. (113) gives exclusively (84) p-ter-butyltoluene, b.p. 188–189°, n_D^{20} = 1.4930 (84). $-\bar{\mathbb{C}}$ For reactn. of $\bar{\mathbb{C}}$ with naphthalene + AlCl₃ (87) or Al/Hg (109) or $\bar{\mathbb{C}}$ with m-cymene + AlCl₃ (88) see indic. refs.]

[\bar{C} with phenol (1:1420) in anhyd. HF gives (85% yield (89)) p-ter-butylphenol (1:1510); \bar{C} with β -naphthol (1:1540) + AlCl₃ gives (90) 4-(ter-butyl)naphthol-2, m.p. 102° (90). — \bar{C} with anisole (1:7445) + ZnF₂ gives (30.6% yield (91)) p-ter-butylanisole, but \bar{C} does not react with anisole + AlF₃ or with furan + ZnF₂ (91).]

[\bar{C} with acetanilide + AlCl₃ in ethylene dichloride at —10° gives (93% yield) N-acetyl-p-ter-butylaniline (111).]

Č under proper conditions gives the corresponding RMgCl cpd.: e.g., Č with Mg in dry ether as directed gives (yields: 80% (92), 62% (93), 60% (95)) cf. (94) ter-BuMgCl; this RMgCl cpd. undergoes the usual reactions (see also below under ⊕'s) including the following: ter-BuMgCl with O₂ below 0° gives (80% yield (95)) ter-BuOH (1:6140) q.v.; with acetyl chloride (1 mole) in C₆H₆ gives (40-54% yield (92)) ter-butyl methyl ketone (pinacolone) (1:5425) (note, however, that ter-BuMgCl with excess acetyl chloride takes a different course (97) and that with various other acyl halides the reducing action of the ter-BuMgCl becomes conspicuous cf. (98) (99) (100)); Č with ethyl chloroformate (3:7295) or diethyl carbonate (1:3150) gives (56% yield (92)) ethyl trimethylacetate (ethyl pivalate) (1:3117); with Č itself to give (10% yield (96)) hexamethylethane (1:7090).

Č reacts with other RMgX cpds. in conventional fashion: e.g., Č with MeMgCl gives (42-50% yield (108)) tetramethylmethane (neopentane) (1:8499); Č with n-PrMgBr in ether + HgCl₂ gives (yield 21% (101), 20% (110)) 2,2-dimethylpentane (1:8543); the numerous other reactions of ter-BuMgCl cannot be reviewed here.

[For reactn. of C with Et₂Zn and numerous homologs see (102).]

- ① ter-Butyl alcohol (1:6140): m.p. 25.6°, b.p. 82.5°. [From Č by shaking with aq. for 24 hrs. at room temp. (6), or on refluxing with 2 vols. aq. for 8 hrs. (72), neutralizing with Na₂CO₃, salting out the alcohol with NaCl, drying over anhyd. Na₂CO₃, and distilling.]
- Trimethylacetic acid (pivalic acid) (1:0410): m.p. 35.5°, b.p. 163-164°. [From Č by

- conversion to ter-BuMgCl (see above) and reactn. of latter with dry CO₂ (yields based on C, 75% (92), 62% (93), 42.5% (17)) (94).]
- Trimethylacetic anilide (pivalanilide): m.p. 132-133° u.c. (103), 132.5-133° (17). [From C by conv. to ter-BuMgCl (see above) and reactn. of latter with phenyl isocvanate in dry ether (17) (103) (104).]
- Trimethylaceto-p-toluidide (pivalo-p-toluidide): m.p. 119-120° u.c. (103). [From $\bar{\mathbf{C}}$ by conversion to ter-BuMgCl (see above) and reactn. of latter with p-tolyl isocyanate in dry ether (103).
- **D** Trimethylaceto- α -naphthalide (pivalo- α -naphthalide): m.p. 146-147° u.c. (103). [From \bar{C} by conversion to ter-BuMgCl (see above) and reactn. of latter with α -naphthyl isocyanate in dry ether (103).]
- ter-Butyl mercuric chloride: long ndls. from aq. acetone as directed (105), m.p. 122-123° dec. (105). [From ter-BuMgCl with HgCl₂ (105).]
- S-ter-Butylisothiourea picrate: m.p. 160-161° (106). [From C with thiourea on htg. in alc. followed by conversion of the resultant hydrochloride to picrate (106); note, however, that, because of the lability of the ter-butyl radical, reactions carried out in MeOH or EtOH may give the corresp. S-methylisothiourea picrate, m.p. 224°, or S-ethylisothiourea picrate, m.p. 188°, and this definitely occurs (107) starting with ter-butyl iodide.]
 - --- N-(ter-Butvl)phthalimide: unreported.
 - ---- ter-Butyl 2,4,6-triiodophenyl ether: unreported.
 - ---- ter-Butyl α-naphthyl ether: unreported.
 - ---- ter-Butyl β-naphthyl ether: unreported.

Colorless mobile liq. with sharp and penetrating odor. — Note that ordinary samples of \bar{C} may (according to their method of preparation) contain more or less PCl₃ (b.p. 75.95° at 760 mm.), POCl₃ (b.p. 107.2° at 760 mm.), SOCl₂ (b.p. 78.8°), AcOH (b.p. 118.2°), Ac₂O (b.p. 140.0°), or various acetylated derivs. of phosphorous acid (if present in large amt. the last in part form a white ppt. on long stdg.), removal of which is difficult. the presence of these impurities doubtless accounts for various instances of abnormally high b.p.'s cf. (7). — \bar{C} may be freed from dissolved HCl and from AcOH by distn. with dimethylaniline (13) or by treatment with powdered basic oxides, hydroxides, carbonates, etc. (14).

PREPARATION OF C

 \bar{C} can be prepared from various sources with a wide variety of reagents; examples of the more important types of combinations are given below grouped under indicated subheadings. — It must also be recognized that many other processes (notably for manufacture of Ac₂O) involve the formation of \bar{C} but immediately utilize it without separate isolation; these cannot be included here.

Preparation of \tilde{C} from AcOH. [For preparation of \tilde{C} from AcOH with PCl₃ (79% yield (20)) (15) (16) (7) (17) under press. at 80° (yield 100% (18)) or in Ac₂O (85% yield (19)) see indic. refs. (note particularly the form. of Ac₂O and of AcO.P(OH)₂ discussed in (17)): with PCl₃ + ZnCl₂ (90% yield) see (20); with PCl₅ (80% yield (20)) (21) see indic. refs.; with POCl₃ (22) (23) see indic. refs.; with P₂O₅ + HCl gas at 0° see (24) (25); with P + Cl₂ in POCl₃ see (26).]

[For prepn. of \bar{C} from AcOH with SOCl₂ (46% yield (20)), with S₂Cl₂ + Cl₂ at -4° in pres. of Fe (95.5% yield (27)), with ClSO₃H (20-25% yield (28)); with sodium chlorosulfonate (29) in pres. of NaCl or Na₂S₂O₇ (30) (31), or with SiCl₄ in toluene (85% yield (32)), see indic. refs.]

[For prepn. of \bar{C} from AcOH with COCl₂ (3:5000) at 110–120° (33) in vapor phase at 160° over MgCl₂ on diatomaceous earth (34) cf. (35) (36); with an arylsulfochloride such as p-toluenesulfonyl chloride + NaCl (30); with another org. acid chloride such as chloroacetyl chloride (3:5235) (37), dichloroacetyl chloride (3:5290) (38), or benzoyl chloride (3:6240) (yield 85–88% (39), 70% (42)) (40) (41); with benzotrichloride (3:6540) (90% yield (42)) see indic. refs.]

Preparation of C from salts of acetic acid. [For prepn. of C from NaOAc (or other metallic acetates) with POCl₃ (43) (44); with SO₂Cl₂ (45) (46); with sodium chlorosulfonate

(29) cf. (30); with SiCl₄ (47) (48); with COCl₂ at 120° under press. (49); with p-toluene-sulfonyl chloride (50); with benzoyl chloride (3:6240) (40) see indic. refs.; from NaOAc/H₂SO₃ compd. with Cl₂ see (51).]

Preparation of \tilde{C} from acetic anhydride. [For prepn. of \tilde{C} from Ac₂O (1:1015) with Cl₂ (52); with dry HCl gas at 100° (52) or in continuous process at 85–90° (93% yield (53)) or under 18–42 atm. press. (100% yield (54)); with PCl₃ (15); with PCl₅ (21); with SOCl₂ at 20–25° (SO₂ being evolved) (55), or with sodium chlorosulfonate (29) see indic. refs.]

[For prepn. of \bar{C} from Ac₂O (1:1015) with phosgene (3:5000) + cat. (56); with benzoyl chloride (3:6240) (77% yield (42)) (41) (40); with oxalyl (di)chloride (3:5060) (80-95% yield (57)); with benzo-trichloride (3:6540) + ZnCl₂ (33% yield (58)); with benzyl chloride (3:8535) + cat. (59) see indic. refs.; for formn. of \bar{C} as by-prod. from reactn. of ethylene with Cl₂ in Ac₂O see (60).]

Preparation of C from methyl chloride. [For prepn. of C from CH₃Cl (3:7005) with CO at 700-800° over pumice contg. sodium metaphosphate (61) or with CO, COCl₂, or COS at 700-900° in pres. of metallic cat. (62) see indic. refs.]

Preparation of \bar{C} from miscellaneous sources. [For prepn. of \bar{C} from 1,1,1-trichloroethane (methylchloroform) (3:5085) by partial cat. hydrolysis (63) (64); from ketene + liq. HCl (65) or with HCl gas over activated carbon at 100° (100% yield (66)); from ethyl, isobutyl, isoamyl, benzyl, phenyl, or p-tolyl acetates with SiCl₄ (67); from α -chloroethyl acetate (3:7625) (68) (69) or α,β -dichloroethyl acetate (69) with ZnCl₂ (68) or over pumice at 250–300° (69); from β -bromo- α,β -dichlorovinyl ethyl ether with AcOH (70); from acetyl bromide with HCl gas at ord. temp. (71); from N,N-diacetylaniline (diacetanilide) with HCl gas at 150–170° (72); from diacetyl sulfite (see below) with SOCl₂ (73) see indic. refs.]

PYROLYSIS OF C

[C in absence of cat. is stable to heat up to at least 450° (74). — C passed at 700-850° over hot Pt wire gives ethylene + CO + HCl (75), but at 400° over Pt on pumice gives (74) 45% MeCl (3:7005) + 49% CO + 5% H₂. — C over Cu filings at 350° is partially decomposed yielding (74) MeCl (3:7005) + CO + CO₂ + H₂ + dehydroacetic acid (1:0700) + acetone. — C over ZnCl₂ on pumice at 400° gives (74) HCl + dehydroacetic acid (1:0700) + gas mixt. contg. 87% CO₂ + 4% CO + 2% H₂. — C over Ni at 420° gives (76) HCl + gas mixt. contg. 62% CO + 32% H₂. — For studies on pyrolysis of C over Al₂O₃, Cu₂Cl₂, CuO, Ni, etc., see (74).]

REACTIONS OF C WITH INORGANIC REAGENTS

Reaction of \tilde{C} with H_2O (hydrolysis). \tilde{C} reacts violently with aq. hydrolyzing to AcOH (1:1010) + HCl (for kinetic studies see (777)); for use of this reactn. in volumetric detn. of H_2O in org. liquids see (185) (78). — Because of its ease of reactn. with aq. \tilde{C} is widely used for condensations, ring closures, etc.

Reaction of C with NH₃ and similar cpds. C with cold conc. aq. NH₄OH (16) or C with liq. NH₃ (79) gives (yields: 77% (16), 88% (79)) acetamide, very sol. aq., m.p. 81.5°, b.p. 222° (best recrystd. from dry AcOEt by addn. of dry ether).

[The direct reaction of \bar{C} with NH₂OH (or its salts) seems to be unreported, but the presumable prod., viz., N-acetylhydroxylamine (acethydroxamic acid) [Beil. II-187, II₁-(85), II₂-(184)], very eas. sol. aq. or alc., insol. ether, cryst. from EtOAc, m.p. anhydrous 89°, contg. crystal aq. 57° , has been obtd. indirectly.]

[The direct reacts. of \tilde{C} with hydrazine hydrate, NH₂.NH₂.H₂O, seems to be unreported, but the presumable prod., viz., acethydrazide (acetylhydrazine) [Beil. II-191, II₁-(86), II₂-(185)], ndls. from alc., m.p. 67°, has been obtd. by indirect means.]

Reaction of \tilde{C} with halogens. [\tilde{C} with Cl_2 in CCl_4 in light (80) or in pres. of I_2 (82) gives mainly chloroacetyl chloride (3:5235); for study of mechanism of chlorination see (81); for influence of \tilde{C} on chlorination of AcOH or Ac₂O see (82), on bromination of AcOH see (83).]

[For studies of \overline{C} with Br₂ see (84) (85) (86).]

Reaction of \bar{C} with inorganic acids. [\bar{C} with dry HBr gas for 2 hrs. gives (80% yield (87)) acetyl bromide [Beil. II-174, II₁-(79), II₂-(176)], b.p. 76.7° at 760 mm., $D_4^{15.8} = 1.6625$, $n_D^{15.8} = 1.45370$; for details on this equilibrium see (88).]

[C with 3 pts. dry HI in the cold gives (70% yield (87)) (89) acetyl iodide [Beil. II-174, II₁-(80), II₂-(177)], b.p. 104-106° at 735 mm. (89) (for studies of use of AcI in splitting of aliphatic ethers (90) or in addn. to unsatd. hydrocarbons (91) see indic. refs.).]

[\bar{C} with cold conc. H_2SO_4 (1 mole) forms a mol. cpd. (88) (92) which can even be obtd. in cryst. form (92); this cpd. loses HCl only upon htg. (88) (92), and the residual acetyl hydrogen sulfate [Beil. II-170, II₁-(78), II₂-(174)] which might be expected is transformed into sulfoacetic acid and other prods. (92). — \bar{C} with nitrosylsulfuric acid in CCl₄ evolves NOCl and yields acetyl HSO₄ which rapidly changes to sulfoacetic acid (93).]

[C with ClSO₃H stood for several days (94) (95) evolves HCl and forms the transient acetyl sulfonyl chloride, CH₃.CO.O.SO₂Cl; above 45° this intermediate rearr. to sulfoacetyl chloride which with water hydrolyzes to sulfoacetic acid; C with ClCO₃H at 60–140°, however, also undergoes condensation involving 4 moles of C with evoln. of HCl and formn. of an acid chloride which on hydrolysis with aq. gives (3% yield (94)) a monobasic acid of compn. C₈H₈O₄ [Beil. XVIII-412], m.p. 99°, which is either 2,6-dimethylpyrone-4-carboxylic acid-3 or 2-methylpyrone-1,4-acetic acid-6 (96); note that this acid is isomeric with but distinct from dehydroacetic acid (1:0700), m.p. 109°. — Note also that C in AcOH boiled with conc. H₂SO₄ gives (97) traces of 2,6-dimethylpyrone.]

[C with solid H₂O₂ (0.6 mole) yields (98) about 60% acetyl hydrogen peroxide (peracetic acid) [Beil. II-169, II₁-(78), II₂-(174)] accompanied by some diacetyl peroxide [Beil. II-170, II₁-(78), II₂-(174)].— C with liq. H₂S yields (99) "dithioacetic acid anhydride," (CH₃.CS)₂S, white cryst., m.p. 225° (99); note that, although neither C nor Ac₂O separately treated with H₂S gas shows any appreciable reaction, yet Ac₂O contg. 2% C absorbs H₂S giving (70% yield (100)) thiolacetic acid [Beil. II-230, II₁-(101), II₂-(208)], CH₃.CO.SH, b.p. 93°. — C (4 moles) with H₂S₃ + ZnCl₂ yields (101) diacetyl trisulfide.]

Reaction of \bar{C} with salts of inorganic acids. $[\bar{C}$ with metal oxides in CHCl₃ at -60 to -20° yields (102) the corresp. metallic chlorides. $-\bar{C}$ with Sb₂S₃ at 300-350° (103) or with K₂S (104) gives diacetyl sulfide [Beil. II-232], b.p. 120°. $-\bar{C}$ with PbSO₃ gives (72) diacetyl sulfite which with SOCl₂ gives $\bar{C} + SO_2$ (72).

[\overline{C} (6 pts.) with KNO₃ (first fused, then powdered) (1 pt.) (105) or \overline{C} with Pb(NO₃)₂ (106) gives mainly (yields: 81-85% (105), 58% (106)) acetic anhydride (1:1015).]

[C with NaN₃ in di-isoamyl ether stood overnight {108} {109}, then warmed at 60-70°, evolves N₂ and gives (86% yield (107)) methyl isocyanate [Beil. IV-77, IV₁-(337), IV₂-(578)], b.p. 27.4-27.8°; note, however, that C with NaN₃ in AcOH evolves N₂ and gives (50-63% yield {110}) N-methylacetamide, m.p. 27-28°, b.p. 202-204° (presumably by cleavage of the CH₃NCO and acetylation of the MeNH₂).]

[\bar{C} with NaHF₂ in Ac₂O (111), with KF in AcOH (41) (42), AgF (112), ZnF₂ (112) (113), HgF₂ (114), C₆H₅HgF (115), SbF₃ (112) (116), or AsF₃ (112) gives (yields: 132% on \bar{C} or 66% on NaHF₂ (111), 76% (41) (42), 40% (113), 30.8% (116)) acetyl fluoride, b.p. 20.8° at 770 mm.]

[\bar{C} with AlCl₃ in CS₂ at -10° gives (117) a mol. cpd., \bar{C} .AlCl₃, as a pale yel. gummy mass; \bar{C} with AlCl₃.Et₂O gives EtOAc (70% yield (118)) + EtCl (3:7015) + AlCl₃. $-\bar{C}$ (1 mole) with AlCl₃ (6 moles) in CHCl₃ gives (124) (CH₃CO)₂.CH.CCl₂.O.AlCl₂ (125) which with

aq. yields (124) (125) acetylacetone (1:1700). — Note also that \bar{C} forms other analogous complexes: e.g., \bar{C} .BCl₃ (119), \bar{C} .BF₃ (119), \bar{C} .SbCl₅ (119) (for use of these in splitting of ethers see (119)).]

[\tilde{C} with 2 pts. sublimed FeCl₃ in CS₂ for 24 hrs. gives (small yield (120)) dehydroacetic acid (1:0700).]

[Č with CaI₂ in s.t. at 70–75° for 120 hrs. gives (121) acetyl iodide (see above under HI).] Reaction of Č with esters of inorganic acids. [Č with Me₂SO₄ (1 mole) + trace of ZnCl₂ at 140–150° evolves HCl and gives (20–25% yield (122)) dimethyl sulfoacetate, b.p. 155–165° at 20–22 mm. (122). — Č + di-n-propyl sulfite + trace ZnCl₂ at 170–200° gives (80% yield (123)) n-propyl acetate (1:3075).]

Reaction of \tilde{C} with metals. [\tilde{C} in excess with metallic Zn gives a solid of compn. $C_{16}H_{18}O_4$ (126), now (127) thought to be 3,8-diacetyl-5,6-dimethyldecatetraene-3,4,6,7-dione-2,9. — \tilde{C} with metallic Zn in dry ether yields (128) EtOAc (1:3015) and AcOH (1:1010). — \tilde{C} with metallic Zn in dry dioxane (1:6400) gives (85% yield (128)) (129) ethylene glycol diacetate (1:3511). — \tilde{C} with CuH evolves H_2 and gives (130) cf. (131) EtOAc (1:3015) + ethylidene diacetate (1:3383).]

REACTIONS OF C WITH ORGANIC REAGENTS

REACTIONS OF C WITH HYDROCARBONS

Reactions of $\tilde{\mathbb{C}}$ with alkanes. [$\tilde{\mathbb{C}}$ with n-butane (or isobutane) + AlCl₃ at 60° for 15 hrs. under press. gives (small yield (132)) isobutyl methyl ketone (1:5430). — $\tilde{\mathbb{C}}$ with n-pentane + AlCl₃ at 15° at ord. press. gives (10% yield (133)) (134) 2,3-dimethylpentanone-4 (unsym.-isopropyl-methyl-acetone) [Beil. 1-703, 1_{1^-} (360)], b.p. 135–136° (oxime, b.p. 101–105° at 20 mm., semicarbazone, m.p. 114° (133)) accompanied (134) by some 2,3-dimethylpenten-3-one-2 (unsym.-isopropylidene-methyl-acetone) [Beil. 1_{2^-} (796)] (corresp. semicarbazone, m.p. 192.5° (134)). — $\tilde{\mathbb{C}}$ with n-hexane + AlCl₃ in similar fashion gives (7% yield (135)) (134) 3-ethyl-2-methylpentanone-4 (unsym.-ethyl-isopropyl-acetone) [Beil. 1-707], b.p. 154–155° (semicarbazone, m.p. 120° (135)) accompanied by a little 3-ethyl-2-methylpenten-2-one-4 (unsym.-ethyl-isopropylidene-acetone), b.p. 177–178° (semicarbazone, m.p. 220° (135).]

Reactions of $\bar{\mathbf{C}}$ with alkenes. $[\bar{\mathbf{C}}$ in the pres. of suitable cat. can add to olefin linkages forming halogenated ketones: e.g., $\bar{\mathbf{C}}$ with ethylene + AlCl₃ at 0° (137) (138) or $\bar{\mathbf{C}}$ + ethylene over activated carbon at 100° and 50 atm. (139) gives (yields: 53% (136), 33% (137)) (138) cf. (60) β -chloroethyl methyl ketone (3:7640) (note that $\bar{\mathbf{C}}$ + ethylene + AlCl₃ in CS₂, latter subsequently replaced by C₆H₆, goes further yielding (140) benzylacetone [Beil. VII-314, VII₁-(167)], b.p. 235°). — For studies of analogous cat. addn. of $\bar{\mathbf{C}}$ to 2-methylbutene-2, 2,3-dimethylbutene-2, and 2-methylbexene-2 see (141).]

Reactions of \bar{C} with alkynes. $[\bar{C}$ in the pres. of suitable cat. can also add to a triple unsatd. linkage yielding olefinic chloroketones: e.g., \bar{C} with acetylene + AlCl₃ at 15° (142) (143) or other cat. (143) gives (25% yield (142)) β -chlorovinyl methyl ketone, b.p. 35–38° at 12 mm. (143). — \bar{C} with butyne-1 (ethylacetylene) + SnCl₄ gives (144) 4-chlorohexen-3-one-2, b.p. 46–53° at 10 mm., $D_4^{25} = 1.0973$, $n_D^{25} = 1.4906$ (144); for analogous reactions with pentyne-1, hexyne-1, hexyne-3, heptyne-1, octyne-4, decyne-5, and dodecyne-6 together with corresp. constants of prods. see (144).]

Reaction of \bar{C} with cycloparaffins (cycloalkanes). [\bar{C} in the pres. of AlCl₃ also condenses with cycloalkanes eliminating HCl; e.g., \bar{C} (1.9 moles) + cyclopentane (1:8400) (5.4 moles) + AlCl₃ (2.2 moles) at 0° gives (145) cyclopentyl methyl ketone (acetylcyclopentane), b.p. 159.5-160.5° at 760 mm., $D_{20}^{20} = 0.9172$, $n = \frac{20}{D} 1.44351$ (145) (semicarbazone, m.p. 142-143° (145)); \bar{C} + methylcyclopentane (1:8403) + AlCl₃ similarly gives (145) 1-

methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane) accompanied by some 1-methylcyclopenten-1-yl-2 methyl ketone (1-acetyl-2-methylcyclopentene-1) (see below).

[\bar{C} in the pres. of AlCl₃ also condenses with cyclohexane, but here the reaction involves in addn. a change from a 6-membered to 5-membered ring: e.g., \bar{C} with cyclohexane (1:8405) + AlCl₃ gives (135) (146) (147) (148) 1-methylcyclopentyl-2 methyl ketone (1-acetyl-2-methylcyclopentane), b.p. 167-168° at 759 mm., $D_4^{20}=0.8976$, $n_D^{20}=1.4404$ (semicarbazone, m.p. 162.5-163° (148), 158° (146); p-nitrophenylhydrazone, m.p. 102.5° (148), accompanied under certain circumstances (135) by 1-methylcyclopenten-1-yl-2 methyl ketone (1-acetyl-2-methylcyclopentene-1), b.p. 185-187° (135) (oxime, m.p. 85-85.5° (148), p-nitrophenylhydrazone, m.p. 162° (148), semicarbazone, m.p. 221° (148), 220° (135)); note that various hydrocarbon by-products are also formed. — \bar{C} + methylcyclohexane (hexahydrotoluene) (1:8410) + AlCl₃ at room temp. similarly gives (149) 1-acetyl-2,3-dimethylcyclopentane, b.p. 182-184° at 754 mm., $D_{20}^{20}=0.8969$, $n_D^{22}=1.44551$ (semicarbazone, m.p. 152°) (149).]

Reaction of \bar{C} with cycloalkenes. [\bar{C} in the pres. of suitable cat. adds to unsatd. linkages of cycloalkenes: e.g., \bar{C} with cyclopentene (1:8037) + AlCl₃ (2 moles) in cyclohexane at -15° gives (50% yield (150)) cyclopentyl methyl ketone (1-acetylcyclopentane) (for constants see above under \bar{C} + cyclopentane); note, however, that \bar{C} + cyclopentene (1:8037) + AlCl₃ at -14° in CS₂ (the latter being subsequently replaced by benzene) gives (140) 1-acetyl-3-phenylcyclopentane (note rearr.).]

[Č with cyclohexene $(1:8070) + \text{AlCl}_3$ (2 moles) in cyclohexane gives $(53\% \text{ yield } \{150\})$ cyclohexyl methyl ketone (1-acetylcyclohexane) [Beil. VII-22, VII₁-(16)]. — Č with cyclohexene $(1:8070) + \text{AlCl}_3$ (1 mole) in CS₂ gives $(21\% \text{ yield } \{151\})$ (152) cyclohexen-1-yl-1 methyl ketone (1-acetylcyclohexene-1) (tetrahydroacetophenone) [Beil. VII-58, VII₁-(49)], b.p. $201-202^\circ$, $D_4^{20} = 0.9655$, $n_2^{20} = 1.4881$ (oxime, m.p. 99° , semicarbazone, m.p. $220-221^\circ$). — Č with cyclohexene $(1:8070) + \text{AlCl}_3$ in CS₂ at -15° gives by addn. a prod. supposed (153) to be 2-chlorocyclohexyl-1 methyl ketone (since it can be converted by loss of HCl to tetrahydroacetophenone (above)) but which when reacted with $C_6H_6 + \text{AlCl}_3$ gives (140) 4-phenylcyclohexyl-1 methyl ketone (1-acetyl-4-phenylcyclohexane); in just which phase rearr. occurs has not been established with certainty.]

Reaction of C with aromatic hydrocarbons. C with aromatic hydrocarbons in the presence of various cat. (notably AlCl₃) evolves HCl and yields aryl methyl ketones; examples are cited in the following paragraphs.

[\tilde{C} with C_6H_6 + AlCl₃ (154) in CS₂ (155) gives (70% yield (155)) methyl phenyl ketone (acetophenone) (1:5515) accompanied by a little 1,3-diphenylbuten-2-one-1 (dypnone) cf. (155); for study of relative reactivity in this sense of AcF, AcCl, AcBr, and AcI see (111); for study of influence of other cat., e.g., FeCl₃ (156) (157), TlCl₃ (158), ZrCl₄ (159), UCl₄ (160), BeCl₂ (161), Al powder (162) or Cr powder (163), or for study of effect of various solvents with AlCl₃ (164) see indic. refs.]

[\bar{C} with toluene + AlCl₃ gives (70% yield (165)) (166) methyl p-tolyl ketone (1:5530); for study of use of BeCl₂ (80% yield (161)) or of 39 other metallic chlorides (167) (168) see indic. refs. — For reactn. of \bar{C} + AlCl₃ with a long series of homologous monoalkylbenzenes see (169) (170), with p-cymene (1:7505) see (171); many other, similar cases cannot be included here.]

[$\bar{\mathbb{C}}$ with naphthalene (1:7200) + AlCl₃ in CS₂ gives a mixt. (75% yield {172}) comprising 50-60% 1-acetylnaphthalene (1:5600) + 15-20% 2-acetylnaphthalene (1:5153). — $\bar{\mathbb{C}}$ with 1-methylnaphthalene (1:7600) + AlCl₃ in nitrobenzene at -3° gives {173} cf. (174) 1-aceto-4-methylnaphthalene; $\bar{\mathbb{C}}$ with 2-methylnaphthalene (1:7605) + AlCl₃ in nitrobenzene gives a mixt. (64% yield {175}) comprising mainly 6-acetyl-2-methylnaphthalene accompanied by some 8-acetyl-2-methylnaphthalene.]

[$\bar{\mathbf{C}}$ with biphenyl (1:7175) + AlCl₃ in CS₂ (176) or C₆H₆ (177) gives (yields: 90% (176), 70% (177)) 4-acetylbiphenyl (p-phenylacetophenone) (1:5201); under appropriate conditions $\bar{\mathbf{C}}$ with biphenyl + AlCl₃ in CS₂ gives (yields: 45% (176), 43% (178)) 4,4'-diacetyl-biphenyl.]

[\tilde{C} with acenaphthene (1:7225) + AlCl₃ in nitrobenzene (179) or with liq. HF (180) gives (29% yield (180)) 1-acetoacenaphthene.]

[Friedel-Crafts condensation can also be carried out with $\bar{\mathbf{C}}$ and heterocyclic systems: e.g., $\bar{\mathbf{C}}$ with thiophene + SnCl₄ in C₆H₆ gives (79-83% yield (181)) 2-acetylthiophene (methyl 2-thienyl ketone); $\bar{\mathbf{C}}$ with thionaphthene + AlCl₃ in CS₂ gives (30% yield (182)) 3-acetylthionaphthene.]

REACTIONS OF C WITH ORGANIC OH (OR SH) COMPOUNDS (OR THEIR METALLIC DERIVATIVES)

Reactions of \bar{C} with alcohols. [\bar{C} reacts with alcs. in general yielding the corresp. acetates: e.g., \bar{C} with MeOH (1:6120) yields methyl acetate (1:3005), \bar{C} with EtOH (1:6130) yields EtOAc (1:3015), etc.; for studies on rate of reactn. of \bar{C} with EtOH in ether (1), or with β -chloroethyl alc. in dioxane (182) (183), or with benzyl alc. or cyclohexanol (182) see indic. refs.] — For use of \bar{C} in quant. detn. of OH groups in prim. and sec. alcs. see (186) (187) (188) cf. (185).

[Special interest, however, attaches to reaction of \bar{C} with ter-alcohols: under ord. conditions these react with \bar{C} to exchange Cl for OH yielding alkyl chloride + AcOH (e.g., \bar{C} + ter-butyl alc. giving ter-BuCl + AcOH); note, therefore, that under special conditions \bar{C} with ter-alcs. also gives the corresp. esters; e.g., \bar{C} with ter-butyl alc. (1:6140) in dry ether + Mg (189) (190) or dimethylaniline (191) or in xylene with pyridine (192) gives (yields: 98% (192), 83% (189), 63–68% (191), 45–55% (190)) ter-butyl acetate (1:3057); other ter-alcs. (189) and other acid chlorides (191) behave similarly.]

[For reactn. of \tilde{C} with cellulose (or cotton) see (193) (194) (195); with polyoxymethylenes see (196).]

[Č with mercaptans yields the corresp. thiolacetates: e.g., \bar{C} with C_2H_5SH gives (80% yield (197)) ethyl thiolacetate, $CH_3CO.S.C_2H_5$, b.p. 116–117°, $D_4^{25}=0.9755$, $n_D^{28}=1.4503$ (197).]

Reactions of C with phenols. C can react with phenols in either or both of two modes: on one hand it can acetylate the phenolic OH yielding the corresp. phenol acetates, or in the pres. of suitable cat. or solvents it can condense with one or more of the nuclear H atoms yielding phenolic ketones. Furthermore the phenol acetates can more or less readily be caused to rearr. into phenolic ketones (Fries rearr.) so that the chemistry of the two classes is closely related and so voluminous that it cannot be given extensive discussion here.

[\tilde{C} with phenol (1:1420) directly (198) (199) or in C_6H_6+Mg (200) gives (yields: 92% (200), 90% (199)) phenyl acetate (1:3571); other mono-, di-, and polyhydric phenols behave analogously.]

[\bar{C} with phenol (1:1420) + FeCl₃ in CS₂ (156) (201) or phenyl acetate (above) + AlCl₃ in nitrobenzene at 20–25° for 24 hrs. (202) gives (yields: 75% (202), 33% (201)) p-hydroxy-acetophenone (1:1527), m.p. 109° (for extensive review of the Fries rearr. reactn. see (203)); the corresp. analogous reactns. of \bar{C} with other mono-, di-, and polyhydric phenols are legion and will not be cited here.]

[For study of series of mol. cpds. of C with various benzeneazophenols see (230).]

Reaction of \bar{C} with phenol ethers. With phenol ethers where no phenolic OH remains to interfere \bar{C} reacts in the pres. of suitable cat. in the Friedel-Crafts sense: e.g. $[\bar{C}$ (2 moles) with methyl phenyl ether (anisole) (1:7445) (1 mole) + AlCl₃ (2 moles) gives (75% yield

(204)) (205) p-methoxyacetophenone (p-acetylanisole) (1:5140); note that $\ddot{\mathbf{C}}$ + anisole do not react in the pres. of AlF₃ or ZnF₂ (111). — Countless analogous condensations of $\ddot{\mathbf{C}}$ with other phenol ethers cannot be discussed here].

Reaction of $\tilde{\mathbf{C}}$ with enols (or their metallic derivatives). [The reaction of $\tilde{\mathbf{C}}$ with ethyl acetoacetate (1:1710) leads according to circumstances to either or both of two very closely similar derivatives; one of these is ethyl O-acetylacetoacetate (ethyl P-acetoxycrotonate) (A) [Beil. III-373, III₁-(135), III₂-(255)], b.p. 212-214° sl. dec. (206), $D_4^{20}=1.060$ (207), $n_D^{20}=1.4447$ (207); the other is ethyl α -acetylacetoacetate (ethyl diacetylacetate) (B) [Beil. III-751, III₁-(263), III₂-(467)], b.p. 209-211° (208), $D_4^{20}=1.093$ (207), $n_D^{20}=1.4687$ (207); note that the latter (B) as liquid is 100% enolized (209) (210) and this prop. is used (211) for detn. of both A+B in their mixtures. — Note furthermore that the O-ester (A) by suitable htg. (212) (213) (214) (215) (216) can be converted to the isomer (B).]

[$\bar{\mathbf{C}}$ with cthyl acetoacetate (1:1710) in pres. of pyridine (217) or $\bar{\mathbf{C}}$ with its Na enolate in ether (219) or its Cu enolate in ether or C_6H_6 (220) gives mainly the O-acetyl deriv. (A) (above); $\bar{\mathbf{C}}$ with ethyl sodioacetoacetate in ether (221) (222) (223) (226) or pet. ether (216) or with the Ca enolate in C_6H_6 (224) or $\bar{\mathbf{C}}$ with ethyl acetoacetate + Mg in C_6H_6 (225) (226) gives (yields: 65% (224), 46-52% (225)) ethyl diacetylacetate (B above) (Cu enolate, m.p. 151° (226)).]

[For study of influence of \bar{C} on rate of enolization of ethyl acetoacetate see (228); for formn. of ethyl O-acetylacetoacetate (isomer A above) from \bar{C} + ketene diethylacetal (30% yield together with other prods.) see (229).]

Reaction of $\tilde{\mathbf{C}}$ with acids or their salts. [$\tilde{\mathbf{C}}$ on htg. with NaOAc or other metal salts of AcOH yields acetic anhydride (1:1015); this reactn. is well known and will not be amplified here; $\tilde{\mathbf{C}}$ with salts of acids other than acetic gives in some cases the corresp. mixed anhydride, in others only the anhydride of the second acid. E.g., $\tilde{\mathbf{C}}$ (1 mole) with dry Na isovalerate (1 mole) gives at 120° the mixed anhydride contg. 1 acetyl and 1 isovaleroyl radical (231); on the other hand, $\tilde{\mathbf{C}}$ with dry Na cinnamate gives only cinnamic anhydride (231); many other examples are known.]

[\bar{C} on htg. with AcOH under appropriate conditions (232) (233) (234) loses HCl giving good yields Ac₂O (1:1015).]

Note that \bar{C} in Ac₂O behaves as a weak acid and can actually be titrated with NaOAc in Ac₂O using methyl orange as indicator (235).

REACTION OF C WITH AMINES (OR THEIR DERIVATIVES)

Reaction of $\bar{\mathbf{C}}$ with primary and secondary amines. $\bar{\mathbf{C}}$ readily reacts with such amines to yield under ord. conditions the N-acetylated derivative: e.g., $\bar{\mathbf{C}}$ with MeNH₂ gives N-methylacetamide [Beil. IV-58, IV₁-(329), IV₂-(563)], very sol. aq., m.p. 27-28°, b.p. 206°; countless other examples are known. Note that only 1 acetyl group is introduced into each amino group; also that $\bar{\mathbf{C}}$ with a mixture of two amines gives mainly (or even exclusively) the N-acetyl deriv. of the more negative accompanied by the hydrochloride of the more positive (236). See also below under $\bar{\mathbf{O}}$'s.

Reaction of \bar{C} with tertiary amines. \bar{C} (1 mole) with pyridine (1 mole) directly (237) (238) or in C_6H_6 (237) ppts. an addn. prod. (presumably N-acetylpyridinium chloride), white cryst. turning red in light, m.p. abt. 100°, after darkening at 90°; for use of this cpd. in cleavage of phenol ethers see (237). — For use of \bar{C} + pyridine in toluene as means of quant. detn. of OH groups see (186).

[Č (1 mole) with Et₈N (1 mole) in 10 vols. dry C₆H₆ (239) or Č in equal. vol. pyridine or picoline (238) yields dehydroacetic acid (1:0700), m.p. 209°.]

[Note here also a novel method of intermolecular dehydrohalogenation: e.g., C with

lauroyl chloride (3:9858) + Et₂N in dry ether ppts. Et₃N.HCl and yields (240) a mixt. of acetylketene (detene dimer) + lauroylketene and other prods. — Note further that since dehydroacetic acid (above) may be viewed as ketene tetramer, its formation from Č with ter-amines (above) may (241) involve preliminary formation of acetylketene followed by Diels-Alder addn. with a second identical molecule to give dehydroacetic acid.]

Reaction of \tilde{C} with other miscellaneous nitrogenous systems. [\tilde{C} with diazomethane in dry ether yields (242) diazoacetone (acetyldiazomethane) [Beil. I_1 -(396), I_2 -(823)] yel. liq., b.p. 49° at 13 mm. (242).]

[C with oximes often is used to effect either dehydration to nitriles or Beckmann rearr. or both (for review see {243}).]

[C with acetanilide refluxed for 7 hrs. gives (244) diphenylacetamidine; other anilides behave in analogous fashion (244). — However, C with acetanilide + AlCl₃ in CS₂ (245) or other inert solvent (246) gives Friedel-Crafts reactn. forming (57% yield (245)) p-(acetylamino)acetophenone [Beil. XIV-48, XIV₁-(366)], m.p. 166-167°.]

[C with thiosemicarbazide results in acetylation followed by elimination of HCl and ring closure yielding (247) (248) the hydrochloride, m.p. 110° (248), of 5-amino-2-methyl-1-thiodiazole-3,4 [Beil. XXVII-629], m.p. 235° (248). — For study of reactn. of C with Schiff's bases see (249).]

REACTION OF C WITH VARIOUS ORGANOMETALLIC COMPOUNDS

Reaction of \bar{C} with Grignard reagents. [The normal reaction of \bar{C} with 1 mole RMgX is to eliminate MgXCl and yield the corresp. ketone; e.g., \bar{C} with EtMgBr in pres. of CdCl₂ gives (46% yield (250)) ethyl methyl ketone (1:5405); in the presence of excess RMgX, however (and sometimes without excess), the ketone may react further to yield the corresp. tertiary alcohol; e.g., \bar{C} with C₆H₈MgBr gives 39% yield (251) diphenyl-methyl-carbinol; countless other examples cannot be included here.]

[Certain divergences from the above normal reaction have, however, now been recognized; these appear to be largely a function of the particular types of RMgX employed. E.g., \bar{C} (0.5 mole) with benzyl MgCl (0.37 mole) in dry ether gives (instead of the expected phenylacetone (1:5118)) 24% yield (252) of o-methylacetophenone (1:5524).]

[Furthermore Č with Grignard reagents derived from tertiary alkyl halides is often reduced and the reactn. prod. then contains (in addn. to the normal prods.) other material derived from the reduction prods. E.g., Č (in excess) with ter-BuMgCl gives (40% yield (253) (254)) ter-butyl methyl ketone (pinacolone) (1:5425); note, however, that further study (255) (256) (13) has shown the formation of numerous other prods. including 2-methylpropane (isobutane), 2-methylpropene-1 (isobutylene), carbon monoxide, ethyl acetate, pinacolyl acetate, and mesityl oxide. — For study of reactn. of Č with ter-AmMgCl (254) (13) and other ter-RMgX cpds. (254) see indic. refs. — Note that even RMgX cpds. from even primary halides may effect reduction; e.g., Č with n-BuMgCl gives (255) 13% hexanol-2 (1:6210) + 8% EtOH (1:6130).]

[Note also that \bar{C} with 2,4,6-trimethylbenzyl MgBr (mesityl MgBr) gives (257) mesitylene but no 2,4,6-trimethylacetophenone (acetomesitylene) although \bar{C} with 2,4,6-triphenyl-phenyl MgBr does give (258) the corresp. 2,4,6-triphenylacetophenone.]

Reaction of \tilde{C} with other miscellaneous organometallic compounds. [\tilde{C} with diphenylmethylsodium reacts to replace Na by H yielding (259) diphenylmethane (1:7120); \tilde{C} with phenylsilver gives (260) 21% acetophenone (1:5515) + 40% biphenyl (1:7175); \tilde{C} with phenylcopper gives (260) 48-54% acetophenone (1:5515).]

[\bar{C} with E₂Mg gives (261) 3-methylpentanol-3 (1:6189) (not *ter*-butyl alc. as was formerly supposed); \bar{C} with dibenzylzinc in pet. ether gives (262) 9% ketones; \bar{C} with dibenzylcadmium in ether gives (262) 18% phenylacetone (1:5118); \bar{C} with Et₂Hg gives

- (263) EtHgCl + butanone-2 (1:5405), but \tilde{C} with dibenzylmercury or with benzylmercuric chloride shows little reaction (262) even after refluxing 2 weeks.]
- [\bar{C} with tetraphenyltin in s.t. at 100° for 15 hrs. gives (very small yield (264)) of acetophenone (1:5515); for reactn. of \bar{C} with tetraethyllead and use in detn. of latter in gasoline see (265).]
 - [C with triphenylbismuth in CCl₄ yields (266) acetophenone (1:5515).]
- [\overline{C} (2 moles) with Ni(CO)₄ (1 mole) in pet. ether gives (267) 4CO + NiCl₂ + biacetyl the latter sepg. as a 1:1 addn. cpd. with the NiCl₂.]
 - D Acetanilide: cryst. from hot aq., m.p. 114°. [From C with aniline (2 moles) followed by recrystallization to remove aniline hydrochloride. Note that even with aniline + aq. at room temp. acetanilide formn. occurs to extent of 35-45% but its proportion diminishes with increase of temp. (268).]
 - Acet-p-toluidide: cryst. from hot aq. or dil. alc., m.p. 153°. [From C + p-toluidine (2 moles) followed by recrystallization to remove p-toluidine hydrochloride.]
 - D Acet-α-naphthalide: m.p. 159°.
 - D Acet-β-naphthalide: m.p. 132°.
 - β-Acetophenylhydrazide (β-acetylphenylhydrazine) (C_6H_5 .NH.NH.COCH₃) [Beil. XV-241, XV₁-(63)]: m.p. 128–129°. [Note that α-acetphenylhydrazide [Beil. XV-236, XV₁-(62)], m.p. 124°, is obtd. from α ,β-diacetylphenylhydrazine [Beil. XV-245, XV₁-(64)], m.p. 107–108°, by partial hydrolysis.]
 - β-Acet-p-nitrophenylhydrazide [Beil. XV-478]: yel. ndls. from alc., m.p. 205-206°.
 β-Acet-2,4-dinitrophenylhydrazide [Beil. XV-492]: yel. pr. from alc., m.p. 201° (269).

Colorless liq. with ethereal odor suggesting C_2H_5Br . Only slightly sol. aq. but miscible with most org. solvs.

 \bar{C} was first reported in 1931 (1) and given the name chloroprene (1) because of its analogy to 2-methylbutadiene-1,3 (isoprene) in structure and reactions. Despite its immense practical importance in the manufacture of various types of synthetic rubbers and plastics comparatively little information on \bar{C} itself has been released for publication in the scientific literature.

[For a study of the toxicity and pathology of \bar{C} see (3); for study of poisoning by \bar{C} and its treatment see (4).]

[For studies of detn. of C (5) by diazometric methods (6) (7) see indic. refs.]

PREPARATION OF C

Č has been prepared from vinylacetylene by addn. of HCl, from dichlorobutenes by elimination of 1 HCl, and from various other sources. Comparatively little on these methods has appeared in the scientific literature, and most of the information is available only through patents. Such of the latter as are here cited must be regarded only as illustrative as no guarantee of complete patent coverage can be offered.

From vinylacetylene. $ildе{C}$ is formed from vinylacetylene (8) by addn. of HCl from aqueous soln. in pres. of catalysts (usually copper salts). The initial step comprises 1,4 addition, and the primary product is 4-chlorobutadiene-1,2 (isochloroprene) (3:7225). Under certain conditions this may be isolated as the major reaction product, but it readily isomerizes (especially in the presence of cuprous chloride and/or other salts (9)) yielding chloroprene. When sufficient amounts of HCl are present further addition to \hat{C} may also occur leading to 2,4-dichlorobutene-2 (3:5550) (see also below).

[For prepn. of C from vinylacetylene (8) with conc. aq. HCl in pres. of $Cu_2Cl_2 + NH_4Cl$ at 30° for 4 hrs. (65% yield) see (1) (47); for studies of this process in foreign laboratories see (10) (11) (12) (2) (24). For examples of patents on this process see (13)-(23) incl. For analogous prepn. of certain homologs of \bar{C} such as 2-chloro-3-methylbutadiene-1,3 (3:7290) and 2-chloro-3,4-dimethylbutadiene-1,3, etc., see (25) cf. (26).]

From dichlorobutenes. [For prepn. of C from 3,4-dichlorobutene-1 (1,2-dichlorobutene-3) (3:5350) with powdered KOH or alc. NaOH see (27) (28); for 2,3-dichlorobutene-1 (3:9074) by thermal dehydrochlorination at 530° without cat. see (29); from 2,4-dichlorobutene-2 (3:5550) by dehydrochlorination (and isomerization) in pres. of fused KOH at 180-190° (30) or over silica gel or clay at 245-275° (31) cf. (30) see indic. refs.; from 1,2-dichlorobutenes by dehydrochlorination with inorg. or org. bases in pres. of org. solvs. see (32).]

From other sources. [For prepn. of $\bar{\rm C}$ from 2,2,3-trichlorobutane (3:5680) by thermal dehydrochlorination over MgCl₂/MgSO₄ cat. see (33); from polychlorobutanes of 55-66% chlorine content (corresp. to dichloro-and trichlorobutanes) by thermal dehydrochlorination at 400-500° see (34) (note that 1-chlorobutadiene-1,3 (3:7210) is also formed; for separation of it from $\bar{\rm C}$ see (35)): for formn of $\bar{\rm C}$ from vinyl chloride (3:7010) with acetylene in pres. of aq. Cu₂Cl₂/NH₄Cl see (36).]

CHEMICAL BEHAVIOR OF C

Addition Reactions

With chlorine. [\bar{C} (2 moles) with Cl₂ (1 mole) in CHCl₃ at -10° in pres. of hydroquinone gives mainly (37) cf. (38) (39) 1,2,4-trichlorobutene-2 (1,3,4-trichlorobutene-2) (3:9062) accompanied by other products such as 1,2,3-trichlorobutene-1 (37), b.p. 40-42° at 10 mm., $D_4^{15} = 1.3190$, $n_D^{15} = 1.4902$ (giving on oxidn. α,β -dichloropropionic acid); note: data also consistent with 2,3,4-trichlorobutene-1 (3:9064) and 1,2-dichlorobutadiene-1,3 (3:9057), b.p. 45-48° at 10 mm. (37), $D_4^{15} = 1.1905$ $n_D^{15} = 1.5065$ (37).]

With bromine. [C (0.3 mole) with Br₂ (0.25 mole) in CHCl₃ at 0-5° gives mainly (40) 2-chloro-1,4-dibromobutene-2, b.p. 98-101° at 10 mm. (oxidizing with KMnO₄ to bromoacetic acid), accompanied by other products; note that in pres. of anti-oxidants distn. range of prod. is much wider perhaps owing to formn. of geom. stereoisomers.]

With iodine chloride. [\tilde{C} with ICl in CHCl₃ at -5° to 0° gives (70% yield (41)) a prod. regarded as 2.4-dichloro-1-iodobutene-2.]

With hydrogen chloride. [\bar{C} with conc. aq. HCl in pres. of Cu₂Cl₂ (42) adds HCl giving 2,4-dichlorobutene-2 (3:5550); for behavior of \bar{C} in liq. HCl see (43).]

With hydrogen bromide. [C (0.96 mole) with dry HBr (0.88 mole) in AcOH at -5° gives (72% yield on Br₂ (44)) 2-chloro-4-bromobutene-2, b.p. 150-152°; $D_4^{20} = 1.5264$, $D_4^{15} = 1.5335$; $n_2^{20} = 1.5160$, $n_2^{15} = 1.5185$; note that this prod. with aq. KMnO₄ oxidizes to AcOH + bromoacetic acid and adds 1 mole Br₂ giving 2-chloro-2,3,4-tribromobutane, b.p. 104.5-106° at 10 mm., $D_4^{15} = 2.1907$.]

With hydrochlorous acid. [The behavior of \bar{C} with HOCl appears not to have been reported; 1,4 addition to \bar{C} might be expected to yield 1,2-dichlorobuten-2-ol-4 and/or 2,4-dichlorobuten-2-ol-1, but neither is reported from any source; an isomer, viz., 2,3-

dichlorobuten-1-ol-4, b.p. 72-73° at 10 mm., $D_4^{20} = 1.3198$, $D_4^{15} = 1.3243$, $n_D^{20} = 1.4956$, $n_D^{15} = 1.4978$, has been reported (45) by indirect means.]

With hypotromous acid. [Č with HOBr (from N-bromoacetamide) gives mainly (45) (note 3,4 addition) 2-chloro-4-bromobuten-1-ol-3, b.p. 77.0-77.25° at 10 mm.; $D_4^{20} = 1.6710$, $D_4^{15} = 1.6770$; $n_D^{20} = 1.5228$, $n_D^{15} = 1.5249$; this prod. in CHCl₃ adds 1 mole Br₂ giving 3-chloro-1,3,4-tribromobutanol-2, m.p. 69.5-71°.]

With alkyl hypoiodite. [\bar{C} with MeOI (from MeOH + HgO + I₂) gives (62% yield (46)) 2-chloro-4-iodo-3-methoxybuten-1, b.p. 76.5-77.0° at 10 mm., $D_4^{20} = 1.7135$, $D_4^{15} = 1.7209$; $n_2^{20} = 1.5312$, $n_2^{15} = 1.5338$. — \bar{C} with EtOI (from EtOH + HgO + I₂) gives (46% yield (46)) 2-chloro-4-iodo-3-ethoxybuten-1, b.p. 82-83° at 10 mm.; $D_4^{20} = 1.6163$, $D_4^{15} = 1.6231$; $n_2^{20} = 1.5198$, $n_2^{15} = 1.5220$. — Note for both these cases the same type of 3.4 addn. observed for HOBr above.]

With sulfur dioxide. [\bar{C} in ether contg. pyrogallol treated with SO₂ at 100–105° in s.t. for 12 hrs. gives in very small amt. (2.5% (47)) an addition prod. 3-chloro-1-thiacyclopenten-3 dioxide (chloroprene sulfone).]

With naphthoquinone-1,4. \tilde{C} (2 moles) with α -naphthoquinone (1:9040) (1 mole) in C_6H_6 refluxed 3 hrs. and the intermediate addition prod. suspended in alc. NaOH and oxidized with air gives (1) 2-chloroanthraquinone (3:4922).

With maleic anhydride. \bar{C} (1+ moles) with maleic anhydride (1:0625) (1 mole) warmed at 50° then boiled with aq. gives (77% yield (1)) 4-chloro-1,2,3,6-tetrahydrophthalic acid, cryst. from aq., m.p. 173-175° cor. (1).

POLYMERIZATION OF C

Č readily polymerizes at 30-35° in light from a 150-watt lamp in 48-80 hours (26); for study of various types of polymers from Č alone see (1). Furthermore, Č with various other unsaturated compounds undergoes copolymerization processes. The practical importance of the polymers and copolymers thus obtained can scarcely be overestimated, but the field is so large, so interlocked, and so rapidly developing that any attempt to organize it is quite beyond the scope of this book. Attention is here directed, however, to a few scientific papers of interest in this connection.

[For studies on structure of polychloroprene see (48) (49); for study of polymers of \bar{C} by ozonization and HNO₃ oxidn. see (50); for detn. of unsaturation in polymers of \bar{C} see (51); for permeability of polychloroprene to gas see (52).]

[For study of influence of tetralin peroxide (53) in nitrobenzene (54) or of high-frequency field (55) (56) on polymerization of \bar{C} see indic. refs.; for photopolymerization of \bar{C} see (57); for study of kinetics of polymerization of \bar{C} in di-n-butyl phthalate soln. in pres. of dibenzoyl peroxide see (58); for detection of free radicals in peroxide polymerization of \bar{C} see (59).

56.4°

at 685 mm. (5)

3: 7085 CHLOROMETHYL METHYL ETHER
$$C_2H_5OCl$$
 (Chlorodimethyl ether; CH_3OCH_2 I_1 -(304) I_2 -(645)

B.P. F.P. 61° (1) -103.5° (9) $D_4^{20} = 1.0703$ (6) 59-60° (2) (3) (29) 1.0605 (5) 59.5° at 759 mm. (4) 59.4° at 760 mm. (5) $D_4^{15} = 1.0771$ (6) 59.1-59.3° at 766 mm. (6) 59.15° at 760 mm. (7) 57.7° at 750 mm. (8) $n_2^{20} = 1.39737$ (10)

 \tilde{C} is frequently but incorrectly designated as "chloromethyl ether"; care should therefore be taken to avoid confusion of \tilde{C} with the closely related "bis-(chloromethyl) ether" (3:5245) which has the structure ClCH₂OCH₂Cl.

Č is insol. cold aq. but on stdg. or warming soon dissolves with hydrolysis (see below). — Č is sol. in cold conc. HCl but can be salted out with CaCl₂.

 \bar{C} forms azeotropes with various org. cpds.: e.g., \bar{C} with acetone (1:5400) forms a const.-boilg. mixt., b.p. 56.1°, contg. 13% \bar{C} (7); \bar{C} with CS₂ forms a const.-boilg. mixt., b.p. 43.1°, contg. 25% \bar{C} (7).

[For prepn. of \bar{C} from aq. formaldehyde soln. (formalin) (1:0145) in MeOH by passage of HCl gas at room temp. (yields: 64-66% (11)) (3) (12) (14) see indic. refs.; from paraformaldehyde (trioxymethylene) (1:0080) in dry MeOH by passage of HCl gas (yields: 80% (6) (15), 66% (16), 60% (17), 50-60% (18)) (19) (13) (20) (23) (note that the prod. conts. MeOH (1:6120), formaldehyde dimethylacetal (methylal) (1:0105), and acetone (1:5400) (1) (15), and that htg. should be avoided since it promotes methylal formn. (15)).

[For formn. of \bar{C} from dimethyl ether [Beil. I-281, I₁-(139), I₂-(269)] with Cl₂ in diffuse daylight (79% yield (21)) (4) or in CHCl₃ or CCl₄ solns. + cat. in light (75); from acetaldehyde dimethylacetal (1:0125) with Cl₂ at not above 60° (other prods. are also formed (22)) see indic. refs.]

Further substitution of \bar{C} . [\bar{C} with Cl_2 in semi-darkness at 12° for 40 hrs. gives mainly (23) bis-(chloromethyl) ether (3:5245).]

Reactions involving the halogen atom of $\bar{\mathbf{C}}$ with inorganic reactants. $\bar{\mathbf{C}}$ is insol. in cold aq. but upon shaking or warming rapidly dissolves yielding soln. contg. formaldehyde (1:0145) + MeOH (1:6120) + HCl (note that paraformaldehyde (1:0080) is formed only on very slow hydrolysis with insufficient water for complete reactn. (18).

[\bar{C} with alc. KSH yields mainly (24) a polymeric thioformaldehyde, (CH₂S)_n, sol. aq. but cryst. from alc., m.p. 123-124° (24); \bar{C} with dry KSH. ½H₂O at 5-10° gives methoxymethyl mercaptan, CH₃OCH₂SH, liq. with disagreeable odor, b.p. 52° at 15 mm., $D_{12}^{12} = 1.0738$, $n_{12}^{12} = 1.4909$ (24); \bar{C} with 2K₂S.H₂O gives (24) bis-(methoxymethyl) sulfide, CH₄OCH₂-S-CH₂OCH₃, liq. with disagreeable odor, b.p. 62° at 15 mm., $D_{21.5}^{21.5} = 1.0418$. $n_{12}^{21.5} = 1.4575$ (24).]

[C with mixt. of HNO₃ (D = 1.5) + conc. H₂SO₄ + fumg. H₂SO₄ (70% SO₃) and appropriate cooling gives in 15 min. nitromethoxymethyl nitrate, oil, b.p. 48° at 15 mm., + (nitromethoxy)methoxy methyl nitrate, highly explosive oil, b.p. 88-89° at 9 mm. (25).]

[$\bar{\mathbf{C}}$ with SO₃ below 0° gives (27% yield (17)) chloromethyl methyl sulfate [Beil. I-582, I₂-(647)], b.p. 92° at 18 mm., $D_{18}^{18} = 1.473$.]

[C in either liq. or gaseous phase with various finely divided metals at 50-250° and press.

from 100-200 atm. yields (26) ethylene oxide (1:6105) and other products. — \bar{C} with metallic Zn at ord. temp. gives (27) formaldehyde dimethylacetal (1:0105) + β -chloroethyl methyl ether (3:7265) + CH₃Cl (3:7005) + resins. — \bar{C} with ZnCl₂.H₂O vigorously stirred at 27° gives (28) b_2 -(chloromethyl) ether (3:5245).]

[For rate of reactn. of C with KI in acetone see (29).]

[Č on adding to cold soln. of NH₃ in ether (30) or with aq. or alc. NH₄OH (4) gives NH₄Cl (pptd. in ether method) + hexamethylenetetramine.]

[C with equal wt. CuCN refluxed 4 hrs. (31) or with 3 wt. pts. Hg(CN)₂ at room temp. for several hrs. (33) gives (yields: 74% (31), 70% (32)) (8) methoxyacetonitrile [Beil. III-242, III₁-(93), III₂-(174)], b.p. 120-121° cor. at 759 mm., $D_4^{20} = 0.9492$, $n_D^{20} = 1.3831$ (31); note that AgCN does not (33) give this result.]

[C with silver cyanate in dry ether in cold gives (30) methoxymethyl isocyanate, colorless lachrymatory oil, b.p. 87.5° cor. (30); C with KSCN in dry C₆H₆ refluxed 2 days gives (34) methoxymethyl isothiocyanate, lachrymatory oil, b.p. 138° at 770 mm.]

Reactions involving the halogen atom of \tilde{C} with organic reactants. By virtue of its very reactive halogen atom, \tilde{C} may conveniently be employed for introducing the methoxymethyl radical in place of reactive H atoms; these may be located in OH groups of alcohols, phenols, or enols or in aromatic nuclei; various acceptors for the resulting HCl are employed or \tilde{C} may be used with metallic derivatives of the reactants; examples of the various combinations are cited below.

[Č with MeOH (1:6120) (12) (35) or with NaOMe (1) (12) gives (small yield (1)) formaldehyde dimethylacetal (methylal) (1:0105); Č with EtOH (1:6130) + pyridine in cold (36) or Č with NaOEt (37) gives (13.3% yield (36)) ethyl methoxymethyl ether (ethylmethyl-formal), b.p. 65.4° at 760 mm., $D_4^{20}=0.84198$, $n_D^{20}=1.36426$ (36) (for corresp. prepn. of mixed formals from Č with n-PrOH, n-BuOH, n-AmOH, and n-hexyl alc. + pyridine (yields all 17-23%) see (36)). — Č with benzyl alc. (1:6480) + pyridine in dry ether gives (47% yield (35)) benzyl methoxymethyl ether, b.p. 208-211° at 756 mm. (35).]

[C with phenol + pyridine does not react (35), but C with K phenolate (38) or Na phenolate (16) (39) gives (70% yield (16)) methoxymethyl phenyl ether, b.p. 188-189° (39), 189-190° (16); for many analogous cases with other phenols see (16) (39).]

[C with sodium salts of phenolic aldehydes gives the corresp. ethers: e.g., C with Na salt of salicylaldehyde (1:0205) in alc. gives (33% yield (40)) (39) o-(methoxymethoxy)-benzaldehyde; for numerous other examples of this type of reaction with phenolic aldehydes see (39) (40) (41) (42) (43).]

[\bar{C} with ethyl cyano-sodio-acetate in dry ether gives (6% yield (44)) ethyl cyano-methoxymethyl-acetate; \bar{C} with diethyl malonate (1:3581) + Na in dry ether (45) or in $C_6H_6(46)$ gives (49% yield (45)) (46) diethyl methoxymethylmalonate, b.p. 121–122° at 15 mm.; \bar{C} with diethyl benzylmalonate + Na in dry ether gives (78% yield (47)) diethyl benzylmethoxymethyl-malonate, m.p. 49–50°, b.p. 194–195° at 19 mm. (47); \bar{C} with ethyl aceto-acetate + Na in dry ether gives (51% yield (48)) O-(methoxymethyl) ether, viz., ethyl β-(methoxymethoxy)crotonate, b.p. 109–110° at 18 mm. (48), accompanied by (42% yield) diethyl α ,γ-diacetylglutarate, b.p. 178° at 10 mm. (48), the latter also being obtd. in good vield from \bar{C} + the Cu enolate of ethyl acetoacetate in dry ether (48).]

[\bar{C} with triphenylmethylsodium gives (49) methyl β,β,β -triphenylethyl ether, cryst. from propyl alc. or lgr., m.p. 137° (49); \bar{C} with diphenylmethylsodium gives (50) methyl β,β -diphenylethyl ether, b.p. 198° at 19 mm. (50).]

[C with salts of organic acids yields the corresp. methoxymethyl esters: e.g., C with dry Pb formate (but not with K or Ca formates (18)) on htg. under reflux gives (20% yield (3) (18)) methoxymethyl formate, b.p. 102-103°; C with fused KOAc (3) or NaOAc (3) (51) (but not Pb or Zn acetates (3)) gives (35-40% yield (3)) methoxymethyl acetate [Beil.

II-151, II₁-(70), II₂-(163)], b.p. $117-118^{\circ}$ (3); for corresp. react. with Pb propionate or Na *n*-butyrate see (3).]

[$\tilde{\mathbf{C}}$ in $\mathbf{C_6H_6}$ with $\mathbf{ZnCl_2}$ + HCl gas at 55-65° gives (52) cf. (28) benzyl chloride (3:8535). — $\tilde{\mathbf{C}}$ with chlorobenzene (3:7903) + dehydrating agts. gives (28) p-chlorobenzyl chloride (3:0220). — $\tilde{\mathbf{C}}$ with toluene + SnCl₄ gives (35-40% yield (53)) p-methylbenzyl chloride (p-xylyl chloride) (3:8660) together with other prods.]

[\bar{C} in AcOH soln. without cat. condenses with aromatic nuclei: e.g., \bar{C} with toluene in AcOH gives (25% yield {15}) a mixt. of o-xylyl chloride (3:8710) and p-xylyl chloride (3:8660); for analogous reactns. of \bar{C} in AcOH with o-xylene (1:7430), m-xylene (1:7420), pseudocumene (1:7470), mesitylene (1:7455), naphthalene (1:7200), tetralin (1:7550), anisole (1:7445), etc., see {15}.

[By virtue of its reactive halogen atom \bar{C} reacts readily with Grignard reagents giving (54) the corresp. methyl ethers: e.g., \bar{C} with n-BuMgBr gives (67% yield (55)) (56) n-amyl methyl ether (1:7905); \bar{C} (2 moles) with decamethylene-bis-MgBr gives (53% yield (57)) dodecanediol-1,12-dimethyl ether; \bar{C} with CH₃—C=C—MgBr gives (58) CH₃.C=C.CH₂OCH₃; \bar{C} with Br—Mg.C=C—MgBr gives (63% yield (32)) 1,4-dimethoxybutyne-2; \bar{C} with C₆H₅MgBr gives (60% yield based on initial C₆H₅Br (59)) benzyl methyl ether (1:7475); \bar{C} with benzyl MgCl gives mainly (60) cf. (61) (62) methyl β -phenylethyl ether (ω -methoxyethylbenzene) [Beil. VI-479, VI₁-(238)], b.p. 185–187° (61), accompanied by some ρ -tolylcarbinol methyl ether and ρ -tolylcarbinol methyl ether, cf. (60).]

[In the pres. of appropriate catalysts $\bar{\mathbb{C}}$ adds to olefinic unsatd. linkages, addition occurring as if $\bar{\mathbb{C}}$ dissociated into (Cl-) and (CH₃O.CH₂-) radicals; examples of these addition reactions are given as follows: $\bar{\mathbb{C}}$ with ethylene + BiCl₃ at 80° under 700–800 lbs. press. for 7 hrs. gives (63) γ -chloro-n-propyl methyl ether; $\bar{\mathbb{C}}$ with propylene + BiCl₃ similarly gives (63) γ -chloro-n-butyl methyl ether; $\bar{\mathbb{C}}$ with 2-methylpropene-1 (isobutylene) + HgCl₂ on stdg. in s.t. 4 days at room temp. gives (60% yield (64)) 2-chloro-4-methoxy-2-methylbutane, b.p. 136° at 751 mm. $D_4^{20} = 0.9455$, accompanied by some ter-butyl chloride (3:7045); but $\bar{\mathbb{C}}$ with isobutylene + TiCl₄ as directed (65) gives the corresp. alc., viz., 3-chloro-3-methylbutanol-1; $\bar{\mathbb{C}}$ with 2-methylbutene-2 (trimethylcthylene) (1:8220) with ZnCl₂ as directed (63) or with HgCl₂ in s.t. at room temp. for 48 hrs. (64) gives (40% yield (64)) 2-chloro-4-methoxy-2,3-dimethylbutane, b.p. 153° at 761 mm., 46-46.5° at 14 mm., $D_4^{20} = 0.9528$, accompanied by some ter-AmCl (3:7220); $\bar{\mathbb{C}}$ with cyclohexene (1:8070) + ZnCl₂ in CS₂ stirred 5 hrs. at 0°, then 3 hrs. at room temp., gives (28.7% yield (66)) cf. (64) (o-chlorocyclohexyl)methyl methyl ether (2-chloro-1-(methoxymethyl)cyclohexane), b.p. 88-91° at 17 mm., $D_4^{20} = 1.1552$ (66).]

[\bar{C} with butadiene-1,3 + ZnCl₂ in s.t. at room temp. for 24 hrs. gives (70% yield (64)) a mixt. of 1-chloro-5-methoxypentene-2, b.p. 168° at 758 mm., 56° at 10 mm., $D_4^{20} = 1.0022$ (from 1,4- addn. (?)) + 3-chloro-5-methoxypentene-1, b.p. 148° at 756 mm., 35° at 10 mm., $D_4^{20} = 0.9740$ (from 1,2 addn. (?)) (note that these two prods. represent synionic mesomers); \bar{C} with cyclohexadiene-1,3 (1:8057) + HgCl₂ under CO₂ at 0° stood 24 hrs. gives (38% yield (64)) (4-chlorocyclohexenyl)methyl methyl cther, b.p. 81° at 10 mm., $D_4^{20} = 1.0636$ (64).]

[$\bar{\mathbb{C}}$ (1 mole) + vinylacetylene (1 mole) + BiCl₃ (trace) + pyrogallol (trace) in dry ether at 5-15° for 9 hrs. (with periodic addns. of BiCl₃) gives (67) 34.8% yield 1-chloro-5-methoxypentadiene-2,3, b.p. 60-61° at 10 mm., $D_4^{20} = 1.0427$, $n_D^{20} = 1.4893$ (by 1,4 addn.), together with 15% yield of 3-chloro-5-methoxypentadiene-1,3, b.p. 46° at 10 mm., $D_4^{20} = 1.0351$, $n_D^{20} = 1.4846$, together with other prods.; note that of the two preceding dienes the former with Cu₂Cl₂ + HCl in ether at 20-40° for 2 hrs. readily isomerizes (81% yield (67)) to the latter; for further reactions of the pair see (67).]

 $[\tilde{C} \text{ with } 4.67\% \text{ dislvd. ZnCl}_2 \text{ shaken with CO at } 25-50^\circ \text{ at } 275-625 \text{ pounds press. for } 8 \text{ hrs. gives } (68) \text{ methoxyacetyl chloride } (3:5225).]$

Č with tertiary amines yields the corresp. quaternary ammonium salts: e.g., Č with Me₃N in dry ether gives (69) methoxymethyl-trimethyl-ammonium chloride (chloroplatinate, m.p. 228–229°, picrate, m.p. 198°); Č with pyridine in dry ether gives (69) methoxymethyl-pyridinium chloride (chloroplatinate, m.p. 182–185° (70), 180–182° dec. (35), HgCl₂ cpd., m.p. 91° (69)); Č with quinoline in CHCl₃ gives (69) methoxymethyl-quinolinium chloride (chloroplatinate, m.p. 232–234°; chloroaurate, m.p. 126–127°); for other quaternary salts see (69).

- Methoxymethyl benzoate: oil, b.p. 283° (71). [From C with NaOBz at 100° (71).]
- ---- Methoxymethyl p-nitrobenzoate: unreported.
- Methoxymethyl 3,5-dinitrobenzoate: unreported.
- —— S-(Methoxymethyl)isothiourea picrate: m.p. 163° (72). [From C + thiourea in cold acetone giving (90% yield (72)) corresp. hydrochloride, m.p. 112° dec., which is then converted to the picrate.]
- ---- N-(Methoxymethyl)phthalimide: cryst. from dry MeOH, m.p. 120-121° (73), 118° (74). [Prepn. reported only by indirect means (73) (74).]

Both stereoisomers form with abs. EtOH const.-boilg. mixts. from which $\tilde{\mathbf{C}}$ can be recovered by repeated shaking with 3 vols. aq. to remove the alc.; the azeotrope with $cis-\tilde{\mathbf{C}}$, b.p. 60.0-60.4° at 760 mm., $D_4^{15}=0.8964$, conts. 81.6% by wt. of $cis-\tilde{\mathbf{C}}$; the azeotrope with trans- $\tilde{\mathbf{C}}$, b.p. 56.8-57.2° at 760 mm., $D_4^{15}=0.8960$, conts. 84.6% by wt. of trans- $\tilde{\mathbf{C}}$ (1).

[For study of toxicity of \bar{C} see (5); for use as anthelmintic see (6).]

[For prepn. of the two geom. stereoisomers of \bar{C} from either d,l- (3:7615) or meso- (3:7580) 2,3-dichlorobutane with alc. KOH (1 mole + 25% excess) refluxed for 3 days see {1}.

[For prepn. of ord. \tilde{C} (mixt. of cis+trans stereoisomers) from 2,2-dichlorobutane (3:7415) with alc. KOH see {8}; from ord. 2,3-dichlorobutane (3:7615) with alc. KOH (1) (2) (3) (8) (9), with aq. NaHCO₃ + Na₂CO₃ under press. (yield 20% \tilde{C} accompanied by 4% butanone-2 (ethyl methyl ketone) (1:5405) + 5% butenols) (7), with aq. alkali or alkaline-earth hydroxides under press. at 118–250° (10), by passing vapor over BaCl₂ at 200–300° (11), or by passing vapor + steam at 300–400° over silica gel contg. MgCl₂ + CaCl₂, etc. (yields 21–25% \tilde{C} accompanied by 35–38% butadiene-1,3 and 6–8% butanone-2) (3) see indic. refs.; from butanone-2 (ethyl methyl ketone) (1:5405) with PCl₅ (\tilde{C} is accompanied by 2-chlorobutene-1 (3:7075) (12) and by 2,2-dichlorobutane (3:7415) (4)) see indic. refs.]

[For prepn. of C from 2,2-dichloro-3-iodobutane (see below) with alc. KOH see (2); from 2-bromo-2-chloro-3-iodobutane with alc. KOH see (2) (note that the isomeric 2-bromo-3-chloro-2-iodobutane under same circumstances gives 3-bromo-2-chlorobutene-2).]

[For prepn. of C from 2,3-dichlorobutene-2 (3:5500) with aq. alk. or alkaline-earth hydroxides under press. at 118-250° see (13).]

[C with Cl2 may add halogen, or be further substituted by halogen, or both, according to

circumstances: e.g., \tilde{C} in liq. phase with Cl₂ at 20–40° in absence of light but in pres. of cat. such as SnCl₄ or FeCl₃ adds Cl₂ giving (14) 2,2,3-trichlorobutane (3:5680); \tilde{C} in liq. phase with Cl₂ in pres. of light and of O₂ (15) or \tilde{C} with Cl₂ in pres. of NaHCO₃ at 0° (4) substitutes further giving (55% yield (4)) (15) 2,3-dichlorobutene-1 (3:9074) (accompanied by 45% 2,2,3-trichlorobutane (3:5680) (4)); \tilde{C} with Cl₂ at 350° gives (16) a mixt. of unsatd. chlorobutenes, probably 1,2-dichlorobutene-2 (3:5560) or (3:5615) and 1,3(2,4)-dichlorobutene-2 (3:5550).]

Č adds Br₂ yielding (2) 2,3-dibromo-2-chlorobutane, b.p. 182.5–186° sl. dec., 66–66.5° at 12 mm., $D_4^{15} = 1.8975$, $n_D^{15} = 1.5339$ (2) (this prod. with alc. KOH loses HBr yielding (2) 3-bromo-2-chlorobutene-2, b.p. 128–129.5°, $D_4^{15} = 1.4998$, $n_D^{15} = 1.4950$ (2)).

[\bar{C} adds ICl yielding (2) 2,2-dichloro-3-iodobutane, b.p. 69.5° at 11.5 mm., $D_4^{15} = 1.8580$, $n_D^{15} = 1.5505$ (2) (this prod. with KOH regenerates \bar{C}).]

[\bar{C} also adds HOCl but from the addn. prod. HCl splits out immediately: e.g., \bar{C} in CCl₄ with Cl₂ + aq. as directed (17) gives (85% yield (17)) 3-chlorobutanone-2 (α -chloroethyl methyl ketone) (3:7598).

[For behavior of C with dry HF yielding 2,2-difluorobutane see (18).]

[\bar{C} with steam passed at 300–400° over silica gel contg. MgCl₂ + CaCl₂ is unchanged (3) (dif. from 3-chlorobutene-1 (3:7090) or 1-chlorobutene-2 (3:7205) which lose HCl yielding butadiene-1,3 (3)). — Note that with alc. KOH the $cis-\bar{C}$ splits off HCl 2.5 times as fast as the $trans-\bar{C}$ (1).] [For dehydrohalogenation of \bar{C} yielding butadiene-1,3 see (19) (20).]

[$\bar{\mathbf{C}}$ with alcoholates or phenolates as directed (9) yields the corresp. ethers; e.g., $\bar{\mathbf{C}}$ with NaOEt yields (9) $\alpha_1\beta$ -dimethylvinyl ethyl ether.]

Č on oxidn. with boilg. aq. KMnO₄ yields (12) acetic acid (1:1010) and propionic acid (1:1025); the *cis*-Č appears to give mainly acetic acid; the *trans*-Č gives mainly propionic acid (12).

trans Stereoisomer

B.P.
$$68.0-68.2^{\circ}$$
 at 760 mm. (1) $D_4^{15} = 0.9205$ (1) $n_D^{14.6} = 1.4225$ (1) $D_4^{0} = 0.9376$ (1)

cis Stereoisomer

B.P. 63.4-63.6° at 760 mm. (1)
$$D_4^{15} = 0.9153$$
 (1) $n_D^{15} = 1.4194$ (1) $D_4^0 = 0.9329$ (1)

Both stereoisomers form with abs. EtOH const.-boil. mixts. from which \bar{C} can be recovered by repeated shaking with 3 vols. aq. to remove the alc.: the azeotrope with the trans form, b.p. 61.2–61.6° at 760 mm., $D_4^{15}=0.8912$, conts. 79.8% by wt. of \bar{C} ; the azeotrope with the crs form, b.p. 57.0–58.2° at 760 mm., $D_4^{15}=0.8946$, conts. 85.2% by wt. of \bar{C} (1).

[For formn. of both trans and cs forms of \bar{C} from d,l-1,2-dichlorobutane (3:7680) with alc. KOH (1 mole + 25% excess) refluxed 3 days (some 2-chlorobutene-1 (3:7075) is also formed) see {1}.]

[The crs form of \bar{C} with alc. KOH splits off HCl 2 9 times as fast as the trans form (1).] [\bar{C} with Cl₂ in dark at 10° gives (70–75% yield (2)) 1,1,2-trichlorobutane, but no constants for latter can be found either in (2) or in prior literature.]

3:7110 (1) Navez, Bull. soc. chim Belg 39, 435-443 (1930); Cent. 1931, I 1269-1270; C.A. 25, 2412 (1931). (2) Henne, Hinkamp J. Am Chem. Soc. 67, 1197 (1945).

3:7120 1-CHLORO-2-METHYLPROPENE-1 CH₃ C₄H₇Cl Beil. I - 209
$$(\beta,\beta$$
-Dimethylvinyl chloride; isocrotyl chloride; CH₃—CH I₂— α -chloroisobutylene)

B.P.
$$D_{25}^{25} = 0.9144$$
 (3) $D_{D}^{25} = 1.4198$ (3) $D_{D}^{25} = 1.4198$ (3) $D_{D}^{25} = 1.4198$ (3) $D_{D}^{25} = 1.4198$ (3) $D_{D}^{20} = 1.4221$ (2) $D_{D}^{20} = 1.4221$ (3) $D_{D}^{20} = 1.4221$ (4) $D_{D}^{20} = 1.4221$ (7)

[See also 3-chloro-2-methylpropene-1 (3:7145).]

Note that for \tilde{C} the designation $\beta_i\beta$ -dimethylvinyl chloride is now preferred, cf. (5); great care should be used to avoid confusion of \tilde{C} with the isomeric and very closely related 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145); both these compounds are now commercial chemicals in the U.S.A.

[For prepn. of \bar{C} from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) see (2) (8): e.g., methallyl chloride (10 moles) with 80% H₂SO₄ (1 mole) stirred at 40° for 2½ hrs. gives an upper phase contg. 87% \bar{C} + 7% residual methallyl chloride + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85% \bar{C} (8) (20).]

[For formn. of C (usually accompanied by the isomeric methallyl chloride and/or other

prods.) from 2-methylpropene-1 (isobutylene) with Cl₂ (5) (9), from 1,1-dichloro-2-methylpropane (isobutylidene dichloride) (3:7425) by actn. of NH₄OH or alc. KOH (4), from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) with alc. KOH (10) see indic. refs.]

[For formn. of \bar{C} (together with the isomeric methallyl chloride) from 1-chloro-2-methyl-propanol-2 (isobutylene chlorohydrin) (3:7752) by soln. in cold 45% H₂SO₄ and subsequent warming (giving 90% \bar{C} + 10% methallyl chloride (2) (8)), or by use of P₂O₅ (11) cf. (12); from 1,1,1-trichloro-2-methylpropanol-2 (1,1,1-trichloro-ter-butyl alc. = "Chlore-tone") (3:2662) with Zn dust + boilg. alc. (13), or from isobutyraldehyde (1:0120) by actn. of PCl₅ (4) see indic. refs.]

C forms with aq. a const.-boilg. mixt., b.p. 61.9°, contg. 7.5% aq. (2)

[For study of anesthetic props. of C see (14).]

Reactions involving further substitution of H atoms in C. [C with Cl₂ (in pres. of 1.5 moles NaHCO₃ at 0° (15)) cf. (2) reacts not only by addn. but also by substitution (the latter involving a shift of double bond) giving respectively 32% 1,1,2-trichloro-2-methyl-propane (3:5710) + 68% 1,1-dichloro-2-methyl-propene-2 (3:7480).]

Reactions involving the double bond of C. [C adds Cl2 (see preceding paragraph).]

[Č also adds HOCl (chlorohydrination); e.g., Č with $Cl_2 + aq.$, or aq. HOCl, or even alkyl or aralkyl hypochlorites as directed (16) cf. (2) (4), yields 1,1-dichloro-2-methyl-propanol-2 (β,β -dichloro-ter-butyl alc.) (3:5772), b.p. 150°.]

[\bar{C} can also undergo catalytic hydration of the double bond: e.g., \bar{C} (1 mole) with 90% H_2SO_4 (1 mole) stirred at -10° to 0° for $2\frac{1}{2}$ hrs., then poured onto cracked ice, diluted with aq., and distilled, gives 66% of the initial \bar{C} as 1-chloro-2-methylpropanol-2 (β -chloro-ter-butyl alcohol) (isobutylene chlorohydrin) (3:7752); note that other acids can also be used for this hydration, e.g., 85% H_3PO_4 , 70% HNO_3 , 60% $HClO_4$, benzenesulfonic acid, e.g., each having its own optimum conditions. Note also that some 18% of the initial \bar{C} is not hydrated but is partially isomerized to a mixt. contg. 90% \bar{C} + 10% methallyl chloride (2) (17).]

Reactions involving the halogen atom of \bar{C} . Note that in \bar{C} the halogen is extremely inert as compared with that of the isomeric methallyl chloride (3:7145); this permits removal of the latter from \bar{C} by chemical means (see below).

[$\ddot{\mathbf{C}}$ is virtually unattacked by aq. or alc. KOH even at 100° (11) (1) (2) (dif. from methallyl chloride (3:7145)). — $\ddot{\mathbf{C}}$ does not react with boilg. aq. K_2CO_3 or KOAc (1) (dif. from methallyl chloride (3:7145)).]

[Č is not normally convertible to isobutyraldehyde except under extreme conditions (5) (dif. from methallyl chloride (3:7145) which upon acid hydrolysis or even boilg, with aquives isobutyraldehyde).]

3: 7125
$$d$$
, l-2-CHLOROBUTANE (sec.-Butyl chloride; CH₃—CH₂—CH—CH₃ I₁— ethyl-methyl-carbinyl chloride)

B.P. F.P. (8.4-68.6° u.c. (28)] -131.3° (1) (10) $D_4^{25} = 0.86767$ (1) (8.25° at 760 mm. (1) (2) (4) 0.87323 (1) (68° at 761 mm. (5) 0.8726 (5) (68° at 769 mm. (5) 0.8707 (6) (67.3-67.8° cor. (6) 67.3° at 761.4 mm. (7) $D_4^{15} = 0.87880$ (1) $D_4^{15} =$

Liquid with agreeable ethereal odor.

[For prepn. of \tilde{C} from butanol-2 (1:6155) by saturation with dry HCl gas and htg. in s.t. at 100° for several hrs. (9); by distillation with 18 wt. pts. 6 N HCl (50% yield (12)); with conc. HCl + ZnCl₂ (2 moles) (yields: 85–88% (13), 83% (14), 82% (5), 78% (15), 60–68% (16) (17)) (6); with PCl₃ + ZnCl₂ (yields: 67% (15), 40% (6)); with PCl₅ + ZnCl₂ (71% yield (15)); with SOCl₂ + pyridine (yields: 90% (15), 47% (5)); or with HCl in pres. of H₃PO₄ (18) see indic. refs.]

[For formn. of \bar{C} from either butene-1 or butene-2 with HCl gas by addn. to unsatd. linkage (7) (19) in pres. of cat. (20) (21) (22) see indic. refs.; from *n*-butane with Cl₂ see (4) (23); from *n*-butylamine with HNO₂ (2.8% yield \bar{C} accompanied by 36.5% butenes, 25% butanol-1, 13.2% butanol-2, 5.2% *n*-butyl chloride (3:7160) and other prods.) see (24); from sec.-butylamine with NOCl in xylene see (25).]

[For study of anthelmintic props. of C see (26).]

Pyrolysis of C. [C at 450-550° without cat. loses HCl and yields (4) (27) a mixt. contg. butene-1, cis-butene-2, and trans-butene-2 (dif. from 1-chlorobutane (3:7160) which gives only butene-1); C at 450° in pres. of anhyd. CaCl₂ as cat. gives (4) (27) the same mixt. (as does also 1-chlorobutane (3:7160)). For use of this pyrolysis in distinction of C from ter-butyl chloride (3:7045) see (23).]

Further halogenation of \tilde{C} . [\tilde{C} with Cl_2 at 200–380° gives (28) a mixt. of dichlorobutanes contg. 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and d,l-2,3-dichlorobutane (3:7680); note, however, that \tilde{C} with Cl_2 in pres. of light gives (29) 1,2-dichlorobutane (3:7680), 1,3-dichlorobutane (3:7925), 2,2-dichlorobutane (3:7415), and both d,l- (3:7615) and meso- (3:7580) 2,3-dichlorobutanes.]

Reactions of the halogen atom of C. [For study of rate of reactn. of C with KI in acetone at 60° see (30).]

[Č with C_6H_6 + AlCl₃ gives (yields: 82.5% (9), 69% (31)) sec.-butylbenzene (1:7490); Č with C_6H_6 + Al/Hg gives (59.5% yield (32)) ter-butylbenzene (1:7460); Č with naphthalene + AlHg gives (48% yield (32)) 1-(sec.-butyl)naphthalene.]

[$\ddot{\mathbf{C}}$ with acetanilide + AlCl₃ in ethylene dichloride (3:5130) at -5° gives (33) N-acetyl-p-(sec.-butyl)aniline, cryst. from di-isopropyl ether, m.p. 121-122° (33).]

C with Mg in dry ether gives (87% yield (34)) sec.-BuMgCl (see also below).

- **D** Ethyl-methyl-acetic acid (1:1105): b.p. 176-177°. [From Č by conversion to RMgCl and carbonation of the latter with CO₂ (yields: 76-86% (35), 72%) (by adding ether soln. directly to solid CO₂ (36)).]
- **D** Ethyl-methyl-acetic-p-toluidide: m.p. 92.5-93° u.c. (39). [From \bar{C} by conversion to RMgCl (see above) and reactn. in dry other with p-tolyl isocyanate (39).]
- Ethyl-methyl-acetic α-naphthalide: m.p. 128-129° u.c. (39). [From C̄ by conversion to RMgCl (see above) and reactn. in dry ether with α-naphthyl isocyanate (39).] [Note that this prod. does not distinguish C̄ from isobutyl chloride (3:7135) for which the corresp. isovalero-α-naphthalide has m.p. 125-126° u.c. (39).]
- —— sec.-Butyl mercuric chloride (sec.-BuHgCl): cryst. from alc., m.p. 30.5° (40). [Reported only by indirect means (40).]
- —— S-(sec.-Butyl)isothiourea picrate; m.p. 190° (41). [Not reported from C but obtd. from sec.-BuBr (0.2 g.) + thiourea (0.2 g.) refluxed in alc. (2 ml.) for 2 min., then treated with PkOH (0.2 g.) dislyd. in least possible hot alc. (41).]
- N-(sec.-Butyl)phthalimide (2-(N-phthalimido)butane): m.p. 24.5-25.5° (42). [Not reported from Č but obtd. (35% yield (42)) from sec.-BuBr with K phthalimide by htg. in s.t. at 210° for 4 hrs.; note that m.p. is too low to be recommended as deriv. for identification.]
- --- N-(sec.-Butyl)-3-nitrophthalimide: unreported.
- --- N-(sec.-Butyl)tetrachlorophthalimide: unreported.
- N-(sec.-Butyl)-o-sulfobenzoic imide (N-(sec.-butyl)saccharin): m.p. 81° (43). [Not reported from C but obtd. from sec.-BuBr or sec.-BuI with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing for 30 min. (43).]
- ---- N-(sec.-Butyl)-N-(p-bromobenzenesulfonyl)-p-anisidide: unreported.
- —— p-(sec.-Butoxy)benzoic acid: m.p. 121-123° u.c. (44). [From C (?) or from sec.-BuBr with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (44).] [Note, however, that this prod. does not distinguish C from the corresp. deriv. of n-amyl chloride (3:7460) whose m.p. is 123-124° u.c. (44).]
- --- sec.-Butyl 2,4,6-triiodophenyl ether: unreported.
- —— sec.-Butyl \(\alpha\)-naphthyl ether: b.p. 293.5° cor. (45). (Corresp. picrate, m.p. 100.5-101.0° cor.; Neut. Eq. calcd. 429, found 427 (45).)

1.40047 (6)

- sec.-Butyl β-naphthyl ether: b.p. 298.5° cor. (45), 298° (46). (Corresp. picrate, m.p. 86.0-86.5° cor. (45); 85° (46); Neut. Eq., calcd. 429, found 429 (46).)

```

Colorless liquid. — Very spar. sol. aq.; 100 ml. aq. at 12.5° dis. 0.092 g. Č (9).

 $\bar{\mathbf{C}}$ forms with aq. a const.-boilg. mixt. (consts. not reported {10}) (use in sepn. from ter-butyl alc. (1:6140) {10}; $\bar{\mathbf{C}}$ also forms binary azeotropes with many org. compounds; e.g., $\bar{\mathbf{C}}$ with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 61.45° at 760 mm., contg. 72 mole % $\bar{\mathbf{C}}$ (11); $\bar{\mathbf{C}}$ with propanol-1 (1:6150) forms a const.-boilg. mixt., b.p. 67.7° at 760 mm., contg. 78 wt. % $\bar{\mathbf{C}}$ (12); $\bar{\mathbf{C}}$ with propanol-2 (1:6135) forms a const.-boilg. mixt., b.p. 64.8° at 760 mm., contg. 83 wt. % $\bar{\mathbf{C}}$ (13); $\bar{\mathbf{C}}$ with ter-butyl alc. (1:6140) forms a const.-boilg. mixt., b.p. 65.5° at 760 mm., contg. 83 wt. % $\bar{\mathbf{C}}$ (14); $\bar{\mathbf{C}}$ with allyl alc. (1:6145) forms a const.-boilg. mixt., b.p. 67.2° at 760 mm., contg. 93 wt. % $\bar{\mathbf{C}}$ (14); $\bar{\mathbf{C}}$ with EtOH (1:6130) + aq. forms a ternary const.-boilg. mixt., b.p. 58.62° at 760 mm. (2 phases), contg. 62.6 mole % $\bar{\mathbf{C}}$ + 19.8 mole % $\bar{\mathbf{E}}$ EtOH + 17.6 mole % aq. (11).

[For prepn. of \tilde{C} from isobutyl alc. (1:6165) with dry HCl gas in s.t. at 120° for 8 hrs. (3) cf. (23) (gives 94% yield of a mixt. of \tilde{C} + ter-butyl chloride (3:7045) from which latter can be removed by 5-hr. shaking with 10% aq. KOH (3)) cf. (22); with dry HCl gas at 100° for 10 hrs. (4) or in pres. of pyridine (15) or CdO, ZnCl₂ or other cat. (16); or over Al₂O₃ at 420° (ter-butyl chloride is also formed (17)); with conc. aq. HCl + ZnCl₂ refluxed 1 hr. (15% yield (18) (19)); with PCl₃ + ZnCl₂ (yields: 85% (20), 80% (18), 32% (21)) (note that some ter-butyl chloride is formed (21)); with PCl₅ (24) or PCl₅ + ZnCl₂ (76% yield (18)); or with SOCl₂ + pyridine (88% yield (18)) (5), SOCl₂ + dimethylaniline (70% yield (18)), SOCl₂ + diethylaniline (58% yield (18)) (note that use of aniline gives only 19% yield (18)) see indic. refs.]

[For formn. of \bar{C} from 2-methylpropane (isobutane) with $Cl_2 + cat$. at 180° (60% yield (25) together with other prods.) (26) see indic. refs.; for formn. of \bar{C} from isobutylene by cat. addn. of HCl (note "abnormal" addition) see (27).]

[For formn. of \bar{C} from isobutylamine with NOCl in xylene at -15° (28) or with aqua regia (29) see indic. refs.; from *n*-butyl acetate (1:3145) by pyrolysis with AlCl₃ see (30).]

[For sepn. of \bar{C} from ter-butyl chloride (3:7045) by hydrol. of latter with aq. alk. and extraction of the resultant ter-butyl alc. with aq. see (10) (3); for sepn. of \bar{C} from more reactive alkyl chlorides (such as ter-butyl chloride (3:7045), methallyl chloride (3:7145), etc.) by esterification of the reactive chlorides by htg. at 125-225° under press. in pres. of Cu with alkali salt of a suitable acid, followed by fractional distn., see (47).]

[C on suitable htg. dec. into isobutylene and HCl; if the process is so conducted that these prods. can react at lower temp. they combine to yield ter-butyl chloride (3:7045): e.g., \bar{C} passed over pumice at 500° (31), or over clay at 250–300° (32), or over BaCl₂, ThCl₄, ThO₂, kaolin, etc., at 300° (33) (34) (35) (36), or with H₂ over reduced Ni at 270° (35) (36) yields isobutylene + HCl; for execution of this process so as to permit recombination to ter-butyl chloride (3:7045) see (37). — Note that \bar{C} on htg. in s.t. at 306° for 6 hrs. gives (3) 8% ter-butyl chloride; for study of the equilibrium in the system \bar{C} + ter-butyl chloride + HCl over range 88–237° see (38).]

[\bar{C} with Cl₂ yields (39) (26) 1,3-dichloro-2-methylpropane (3:7960) and other prods. — \bar{C} with Br₂ (1 mole) in pres. of Fe in s.t. at 100° for 6 hrs. gives (40) 1,2-dibromo-2-methyl propane (isobutylene dibromide), b.p. 148° (40).]

[C with aq. soln. or susp. of inorg. bases under press. at 120-350° yields (41) a mixt. contg. isobutyl alc. (1:6165), ter-butyl alc. (1:6140), and isobutylene. — For study of rate of hydrolysis of C in 50% alc. in pres. and abs. of dil. H₂SO₄ see (42). — In connection with hydrolysis of C to isobutyl alc. note that these two form no azeotrope (1).]

[\overline{C} with Na in liq. NH₃ gives 2-methylpropane (isobutane) (43); but \overline{C} with NaNH₂ in liq. NH₃ gives isobutylene (43).]

[\bar{C} with $C_6H_6+AlCl_3$ gives exclusively (44) (45) (46) (21) ter-butylbenzene (1:7460).] \bar{C} with Mg in dry ether in pres. of trace of MeI as cat. gives in 8 hrs. (98.9% yield (48))

- corresp. isobutyl MgCl; the ethereal soln. of this RMgCl undergoes the usual reactns. (see also below).
 - ① Isovaleric acid (1:1050) q.v. [From isobutyl MgCl with CO₂ followed by dil. non-volatile acid and subsequent distn. (49) (yield not reported).]
 - ① Isovaleranilide: m.p. 109-110° u.c. (50). [From isobutyl MgCl (above) with phenyl isocyanate in dry ether (50).] [Note that this derivative does *not* distinguish Ĉ from isoamyl chloride (3:7365) or 2-chlorobutane (3:7125) q.v.]

 - —— Isobutyl mercuric chloride: unreported.
 - —— S-(Isobutyl)isothiourea picrate: m.p. 174°(51). [This prod. has been reported from isobutyl bromide (or iodide) (but not from C) by htg. with thiourea in alc. for 2 min., followed by addn. of alc. PkOH (51).]
 - ---- N-(Isobutyl)phthalimide (1-(N-phthalimido)-2-methylpropane): lfts. from CS₂, m.p. 93° (53). [This prod. has been reported from isobutyl bromide with K phthalimide on htg. in s.t. at 210° for 3-4 hrs. (53).]
 - ---- N-(Isobutyl)-3-nitrophthalimide: unreported.
 - --- N-(Isobutyl)tetrachlorophthalimide: unreported.
 - —— N-(Isobutyl)-N-(p-bromobenzenesulfonyl)-p-anisidide: cryst. from 75% alc., m.p. 78-79° (57). [From C (?) or the corresp. isobutyl bromide with N-(p-bromobenzenesulfonyl)-p-anisidine in alc. KOH after 1 hr. refluxing (57).]
 - —— N-(Isobutyl)-o-sulfobenzoic imide (N-(isobutyl)saccharin: m.p. 75.0° (55). [Not reported from C, but obtd. from isobutyl bromide or iodide with sodium saccharin in aq. butylcarbitol (1:6517) on refluxing 30 min. (55).]
 - p-(Isobutoxy)benzoic acid: m.p. 140-141° u.c. (56). [From \bar{C} with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (56).] [Note, however, that this prod. does not distinguish \bar{C} from isoamyl chloride (3:7365) for which the corresp. p-(isoamoxy)benzoic acid has m.p. 141-142° (56).]
 - —— Isobutyl 2,4,6-tri-iodophenyl ether: m.p. 48.0° cor. (52). [This prod. has been obt. from isobutyl bromide (but not Č) with 2,4,6-tri-iodophenol in alc. NaOEt (52).] [Note that it would not distinguish Č from 1-chloropentane (3:7460) or 1-chlorohexane (3:7955).]
 - —— Isobutyl α-naphthyl ether: b.p. 301.5° cor. (54). (Corresp. picrate, m.p. 104.5–105.5° cor. (54).)
 - Isobutyl β-naphthyl ether: b.p. 204.5° cor. (54), m.p. 33.0-33.5° cor. (54). (Corresp. picrate, m.p. 84.0-85.0° cor. (54).)
- 3:7135 (1) Timmermans, Martin, J. chim. phys. 23, 778-779 (1926). (2) Timmermans, Bull. soc. chim. Belg. 27, 334-343 (1913); Cent. 1914, I 618. (3) Michael, Zeidler, Ann. 393, 110-111 (1912). 3:7145 3-CHLORO-2-METHYLPROPENE-1 CH₃ C₄H₇Cl Beil. I - 209 (Methallyl chloride; isobutenyl chloride; CH₂—CH₂ I₁— I₂—
$$\beta$$
-methylallyl chloride; γ -chloroisobutylene)

B.P.
$$[73.74^{\circ}]$$
 (1)] $D_{4}^{20} = 0.9475 \ (7)$ $n_{D}^{20} = 1.4340 \ (7)$ $71-74^{\circ}]$ (2) $72.2^{\circ}]$ (3) (8) $71.5-72.5^{\circ}]$ (4) (5) $70-71^{\circ}$ (6) at 739 mm. (7)

[See also 1-chloro-2-methylpropene-1 (3:7120).]

Note that for \bar{C} the designation methallyl chloride is now preferred (3); great care should be used to avoid confusion of \bar{C} with the isomeric and very closely related 1-chloro-2-methyl-propene-1 = isocrotyl chloride = β , β -dimethylvinyl chloride = α -chloroisobutylene (3:7120); both these compounds are now commercial products in the U.S.A.

Commercial \bar{C} contains approx. 4% (10) of the isomeric β,β -dimethylvinyl chloride (3:7120); owing to the proximity of their boiling points the two isomers are extremely difficult to separate by distillation (8), but owing to the great reactivity of the halogen of \bar{C} (see amplification below) and the relative unreactivity of the halogen of β,β -dimethylvinyl chloride (3:7120) interference from the latter in *metathetical* reactions of comml. \bar{C} need not be expected.

[For prepn. of \bar{C} from 2-methylpropene-1 (isobutylene) with Cl_2 see (3) (2) (5) (9) (other prods. are also formed); for formn. of \bar{C} as its equilibrium mixt. (10% \bar{C}) with β,β -dimethylvinyl chloride (3:7120) by actn. of H_2SO_4 on latter see (8).]

[For use of \tilde{C} as insecticide see (11) (12); for toxicity studies on beetles see (13); for detn. of \tilde{C} (when used as industrial furnigant) by reaction with ethanolamine in dioxane

. (14) or by thermal decomposition (15) see indic. refs.; for use of $\bar{\mathbf{C}}$ in prepn. of cellulose ethers see (16) (17).]

Reactions involving further substitution of H atoms in \bar{C} . [\bar{C} with Cl_2 at room temp. (8) cf. (5) (9) or in pres. of NaHCO₃ soln. at 0° (2) gives (70% yield (8)) a mixt. of approximately equal amounts of 1,3-dichloro-2-methylpropene-1 (3:5590) and 1-chloro-2-(chloromethyl)propene-2 (3:5633) (see also next paragraph).]

Reactions involving the double bond of C. [C with Cl₂ (5) (42) or with SO₂Cl₂ (42) also (see above) adds halogen to the unsaturated linkage yielding (5) (42) 1,2,3-trichloro-2-methylpropane (3:5710), b.p. 163.5-164° at 772 mm. (5).]

[Č with Br₂, however, gives chiefly (93% yield (8)) cf. (5) (9) the expected addition prod., 1-chloro-2,3-dibromo-2-methylpropane [Beil. I-128], b.p. 57° at 5 mm., $D_4^{20} = 1.9168$, $n_D^{20} = 1.5834$ (8).]

[\bar{C} adds HCl with considerable difficulty; e.g., \bar{C} with equal vol. 12 N HCl at 3°, or \bar{C} at b.p. treated with HCl gas for 2 hrs., shows no reaction (3); however, \bar{C} with equal vol. 12 N HCl shaken for $1\frac{1}{2}$ hrs. at 63° forms 30% of the expected 1,2-dichloro-2-methyl-propane (3:7430). — \bar{C} with dry HBr gas readily reacts giving (97% yield (8)) 1-chloro-3-bromo-2-methylpropane, b.p. 49° at 15 mm., $D_4^{20} = 1.4839$, $n_D^{20} = 1.4816$ (8) (note that this "abnormal" mode of addition of HBr is presumably attributable to the presence in \bar{C} of peroxidic material (8)).]

[$\ddot{\mathbf{C}}$ with aq. HOCl below 5° (1) (7) cf. (8), or $\ddot{\mathbf{C}}$ with Cl₂/aq. (8) (18) or even org. hypochlorites (18), gives by addn. of HOCl to unsatd. linkage 1,3-dichloro-2-methylpropanol-2 (3:5977). — $\ddot{\mathbf{C}}$ with aq. HOBr (from Br₂/KBr in aq.) at room temp. for 4 hrs. gives 97.5% yield (1)) 1-bromo-3-chloro-2-methylpropanol-2, b.p. 84-85° at 20 mm., $D_{20}^{20}=1.7578$, $n_{20}^{20}=1.5171$ (1). — $\ddot{\mathbf{C}}$ in ether with aq. HgO + I₂ (HOI) at room temp. for 5-6 hrs. gives (15% yield (1)) 3-chloro-1-iodo-2-methylpropanol-2, b.p. 101-103° at 18 mm., $n_{20}^{20}=1.547$ (1).]

[$\bar{\mathbf{C}}$ can also add hypochlorite esters; e.g., $\bar{\mathbf{C}}$ with ter-BuOCl (3:7165) in MeOH + trace p-toluenesulfonic acid at 40° for 3-4 hrs. gives (35% yield (6)) β , β -dichloro-ter-butyl methyl ether (1,3-dichloro-2-methoxy-2-methylpropane), b.p. 170° at 748 mm., $D_{-}^{20} = 1.1953$, $n_{D}^{20} = 1.4595$ (6).]

[\bar{C} can also undergo cat. hydration of the double bond; e.g., \bar{C} , although but slightly sol. in 80% H₂SO₄ at 0°, grad. dissolves on stirring; and after the solution is poured onto ice and the liquid distilled (8) (19) 63% of the original \bar{C} can be recovered as β -chloro-terbutyl alcohol (isobutylene chlorohydrin) (1-chloro-2-methylpropanol-2) (3:7752). Note that other acids can also be used for this hydration, e.g., 85% H₃PO₄, 70% HNO₃, 60% HClO₄, benzenesulfonic acid, etc., each having its own optimum conditions (8). Note also that in this reaction some 32% of the initial \bar{C} is not hydrated but is partially isomerized to a mixt. contg. 10% \bar{C} with 90% β , β -dimethylvinyl chloride (3:7120) (see also below) (8).]

[$\ddot{\mathbf{C}}$ can also be rearranged to the isomeric isocrotyl chloride; e.g., $\ddot{\mathbf{C}}$ (10 moles) with 80% H₂SO₄ (1 mole) stirred at 40° for 2½ hrs. gives an upper phase which conts. abt. 87% isocrotyl chloride + 7% $\ddot{\mathbf{C}}$ + 6% dichlorides and polymers; after washing free from acid, drying, and distilling it yields 85% β , β -dimethylvinyl chloride (3:7120) (8) (20).]

[C on sulfonation with dioxane sulfotrioxide in ethylene dichloride gives (21) a complex mixt. of prods.; about 40% of the SO₃ adds to the unsatd. linkage giving a cyclic anhydride of the carbyl sulfate type, the remainder substituting to yield the three isomeric monosulfonic acids of C; neither polymerization nor disulfonation takes place; for details the original paper (21) should be consulted.]

[For polymerization of C in the pres. of peroxides see (22).]

[C condensed with C6H6 in pres. of anhydrous liq. HF at 0-10° for 20 hrs. as directed

(23) gives mainly (66% yield) 1-chloro-ter-butylbenzene (1-chloro-2-methyl-2-phenyl-propane), b.p. 111° at 90 mm., accompanied by a small amt. (10% yield) bis-(1-chloro-ter-butyl)benzene, b.p. 140° at 4 mm.]

Reactions involving the halogen atom of C. [C upon hydrolysis with boilg. aq. K2CO3 soln. for 30 hrs. (9) cf. (5) (4) (43) or C with 10% aq. NaOH at 116° under press. (reaction complete in 15 min.) (10) (24) yields the corresp. methallyl alcohol (2-methylpropen-2-ol-1). b.p. 114.49° , $D_4^{20} = 0.8515$, $n_D^{20} = 1.4255$ (10); for important extensive survey of its reactions see (25). Note, however, that the nature of the material obtd. by hydrolysis of Č (because of the reactivity of the resultant methallyl alcohol) depends upon the precise conditions: e.g., if the reaction mixture becomes acid (either through inadequate mixing or lack of suitable neutralizer) isobutyraldehyde (1:0120) is formed (for instance, C with $CaCO_3 + aq$. at 140-180° under press. gives only isobutyraldehyde); if only temporary local regions of acidity develop and these subsequently become alkaline a complex mixt. (contg. isobutyric acid (1:1030), isobutyl alcohol (1:6165), and 2,2,4-trimethylpentanediol-1,3 [Beil. I-492, I₂-(558)]) may result from the action of alk. on the isobutyraldehyde. — Note also that the principal by-product of the neut. or alk. hydrolysis of C (invariably formed to abt. 5%) is bis-(methallyl) ether, b.p. 134.34°, $D_4^{20} = 0.8163$, $n_D^{20} = 1.4276$; note that this cpd. forms with methallyl alc. a const.-boilg. mixt., b.p. 114.06° (almost identical with the b.p. of methallyl alc. itself), contg. 81.3 wt. % of bis-(methallyl) ether + 18.7 wt. % methallyl alc. (10) (for still other azeotropes in this system see (10).)]

[$\bar{\mathbf{C}}$ with metal alkoxides or even $\bar{\mathbf{C}}$ with alcohols + conc. aq. NaOH readily gives the corresp. ethers: e.g., $\bar{\mathbf{C}}$ with NaOEt (9) or alc. KOH (9) or EtOH + 50% aq. NaOH refluxed for 7 hrs. (10) (26) gives ethyl methallyl ether, b.p. 84.8-86.8°, $D_4^{20}=0.8151$, $n_D^{20}=1.4067$ (10); $\bar{\mathbf{C}}$ (2 moles) with methallyl alc. (3 moles) + 50% aq. NaOH (4 moles) refluxed 2 hrs. gives (91.9% yield (10)) bis-(methallyl) ether (for consts. see preceding paragraph). (Note that this last ether cannot be prepd. by conventional bimolecular dehydration with acid because under such conditions only isobutyraldehyde results.) — Note that in reaction with alc. NaOEt $\bar{\mathbf{C}}$ has about the same reactivity as allyl chloride (3:7035) at 35° but slightly less at 50°; $\bar{\mathbf{C}}$, however, is less reactive at 35° than crotyl chloride (1-chlorobutene-2) (3:7205), and the latter less than 1-chloro-2-methylbutene-2 (3:7485) (10). — For reactn. of $\bar{\mathbf{C}}$ with phenol (1:1420) + dry $\mathbf{K}_2\mathbf{CO}_3$ refluxed 24 hrs. in acetone and giving (72% yield (4)) corresp. methallyl phenyl ether, b.p. 89° at 10 mm., see (4).]

[\bar{C} with aq. or alc. NaSH (10) (27) or \bar{C} with aq. thiourea refluxed 2 hrs. then made alkaline (28) gives (68% yield (28)) methallyl mercaptan, b.p. 93.5° at 760 mm. (28), 92.4–92.6°, $D_4^{20}=0.9137$, $n_D^{20}=1.4872$ (10). — \bar{C} with Na₂S.9H₂O at 120° under press. (10) (27) yields bis-(methallyl) sulfide, b.p. 172.8–173.0°, $D_4^{20}=0.8836$, $n_D^{20}=1.4862$ (10); \bar{C} with Na₂S₂ at 120° under press. (10) (27) yields bis-(methallyl) disulfide (no constagiven (10)) (both the sulfide and disulfide are valuable fly repellents and fumigants (29).) — \bar{C} with NaSCN (30) or NH₄SCN (10) gives on refluxing 3–6 hrs. (yields: 94–95% (30), 70% (10)) methallyl isothiocyanate, b.p. 169–170° at 760 mm. (30), 89–90° at 50 mm. (30), 78° at 25 mm. (30), 64° at 10 mm. (30) (forms with aq. a const.-boilg. mixt., b.p. 96.3–97.5° (10)), $D_4^{20}=0.9926$ (10), $n_D^{20}=1.5220$ (10).]

[$\ddot{\mathbf{C}}$ with NaBr in dry acetone refluxed for 5 hrs. gives (15-20% yield (10)) (27) methallyl bromide [Beil. I₂-(182)], b.p. 94.2-95.2° at 774 mm., $D_4^{20}=1.31335$, $n_D^{20}=1.46886$ (31). — $\ddot{\mathbf{C}}$ with NaI in dry ethyl methyl ketone (1:5405) refluxed 3 hrs. gives (12% yield (10)) (27) methallyl iodide, b.p. 25-30° at 3-5 mm., $n_D^{20}=1.4862$ (10) (very unstable and may decompose violently even at room temp. on prolonged storage (10)); note that in this reactn. $\ddot{\mathbf{C}}$ is more reactive than allyl chloride (3:7035) but somewhat less reactive than 1-chloro-2-methylbutene-2 (3:7485) and considerably less reactive than 1-chlorobutene-2 (crotyl chloride) (3:7205) (10). $\rightarrow \ddot{\mathbf{C}}$ with CuCN in nitrobenzene at 125-130° for $\frac{1}{2}$ hr.

gives (58% yield on CuCN (10)) (27) methallyl cyanide, b.p. 136.2-136.4°, $D_4^{20} = 0.844$, $n_{20}^{20} = 1.4202$ (10); note that use of NaCN gives a prod. of somewhat higher b.p., 138.0-139.5° (10), indicating pres. (by rearr.) of some β,β -dimethylacrylonitrile, b.p. 140-142°.]

[\bar{C} (1 mole) with conc. aq. NH₄OH (10 moles) at 90° under press. reacts completely within 2 minutes giving (10) (32) mixt. of 56% methallylamine, b.p. 78.8°, $D_4^{20} = 0.782$, $n_D^{20} = 1.431$ (10) (\bar{B} .HCl, m.p. 190–191° cor. (41); \bar{B} .PkOH, m.p. 202–206° cor. (41)) + 26% di-(methallyl)amine, b.p. 148–149°, $D_4^{20} = 0.799$, $D_D^{20} = 1.446$ (10), + 8% tri-(methallyl)amine, b.p. 194–195° (32), 83–85° at 15 mm., $D_4^{20} = 0.8256$, $D_D^{20} = 1.457$ (10), together with 5% tetra (methallyl)ammonium chloride; \bar{C} htd. with primary amines behaves in analogous fashion (10) (32).]

[C with Mg in dry other under very carefully regulated conditions (using large excess of Mg + ether and slow addn. of C) gives as high as 90% yield (10) corresp. methallyl MgCl; this with acetaldehyde (1:0100) gives (65% yield (10)) the expected secondary alc. 4-methylpenten-4-ol-2, b.p. 129° (10); similarly C with Mg + acetone (1:5400) in dry ether gives (59 mole % yield (10)) 2,4-dimethylpentene-4-ol-2, b.p. 126° (10) accompanied by (37 mole % yield (10)) of the coupling prod. di-methallyl (see next paragraph); note that this coupling reaction is very difficult to suppress.]

[\bar{C} with Mg in dry ether (10) (33), or with Na in dry ether (34), gives (yields: 90 mole % (10), 65% (33)) di-methallyl (2,5-dimethylhexadiene-1,5) [Beil. I-259, I₁-(122), I₂-(237)], b.p. 114.3° at 760 mm. (10) (33), $D_2^{20}=0.7487$ (10), 0.7423 (33), $n_D^{20}=1.4293$ (33). — Coupling of \bar{C} with other reactive alkenyl chlorides can also be effected: e.g., \bar{C} with allyl chloride (3:7035) + Mg in dry ether gives (33) 47% yield 2-methylhexadiene-1,5 [Beil. I-257, I₁-(120)], b.p. 88.1° at 760 mm., $D_D^{20}=0.7198$, $n_D^{20}=1.4184$ (33), +30% di-methallyl (see above) + 12% hexadiene-1,5 (biallyl) (1:8045). — For analogous mixed couplings with 2-chloropentene-3 (piperylene hydrochloride) (3:7465) see (36).]

[$\ddot{\mathbf{C}}$ with NaNH₂ in liq. NH₃ gives (27% yield (35)) 2,5-dimethylhexatriene-1,3,5, b.p. 145° at 747 mm., 90.2° at 200 mm., m.p. -9° , $n_{\mathrm{D}}^{21}=1.5150$ (35); note that an intermediate x-chloro-2,5-dimethylhexadiene, b.p. 33-34° at 5 mm., $n_{\mathrm{D}}^{20}=1.4612$, has been detected (35).]

[$\bar{\mathbf{C}}$ reacts normally with other RMgX compounds: e.g., $\bar{\mathbf{C}}$ with MeMgBr in di-isopropyl ether (ord. ether boils too close to prod.) gives (10) 2-methylbutene-1 (1:8210); $\bar{\mathbf{C}}$ with n-BuMgCl gives (83 mole % yield (10)) (33) 2-methylheptene-1, b.p. 119.3° at 760 mm., $D_4^{20} = 0.7206$, $n_D^{20} = 1.4123$ (33) (contaminated with 2-methylheptene-2 formed by rearrof the former by the inevitable MgCl₂ (33)); $\bar{\mathbf{C}}$ with iso-AmMgCl gives (10) 2,6-dimethylheptene-1, b.p. 140-143° (10); $\bar{\mathbf{C}}$ with C_6H_5 MgBr gives (10) methallylbenzene (2-methyl-1-phenylpropene-1), b.p. 175-176° (10).]

[For reactn. of C with diethyl malonate (1:3581) and with various diethyl alkylmalonates see (37); for prepn. of methallyl substituted barbituric acids (37) (4) or thiobarbituric acids (38) see indic. refs.]

- Methallyl acetate [Beil. I-137, I₂-(150)]: b.p. 124° at 760 mm., $D_{20}^{20} = 0.9239$, $n_{D}^{20} = 1.4129$ (39). [From \bar{C} + KOAc at 150° in s.t. (5) (9) cf. (10).] [For data on the formate, propionate, and n-butyrate see (39).]
- Methallyl benzoate: yel. odorless oil, b.p. 120° at 50 mm. (40). [Prepd. indirectly (40).]
- ---- Methallyl p-nitrobenzoate: unreported.
- ---- Methallyl 3,5-dinitrobenzoate: unreported.
- M-(Methallyl)phthalimide: white cryst. from MeOH, m.p. 88.5-90° cor. (41). [From C + K phthalimide in s.t. at 150° for 3 hrs. (41).]

See also Note 1.

Note 1: For further data on b.p. at press. over range 565-760 mm. see (15).

Note 2: Č is very spar. sol. aq.; e.g., 0.066 wt. % at 12° (20).

Binary systems of \tilde{C} with other org. cpds. For f.p./compn. data on mixts. of \tilde{C} with ter-BuCl (3:7045) see (21); for partial vapor press. (17) or n_D^{20} (22) of mixts. of \tilde{C} with n-heptane (1:8575) or n-BuBr see indic. refs.

Č forms azeotropes with various other org. cpds.; e.g., Č with MeOH (1:6120) forms a const.-boilg. mixt., b.p. 57.0° at 760 mm., contg. 73 wt % Č (4); Č with EtOH (1:6130) forms a const.-boilg. mixt., b.p. 65.7° at 760 mm., contg. 79.7 wt. % Č (4); Č with n-PrOH (1:6150) forms a const.-boilg. mixt., b.p. 74.8° at 760 mm., contg. about 82 wt. % Č (4); Č with iso-PrOH (1:6135) forms a const.-boilg. mixt., b.p. 70.8° at 760 mm., contg. 77 wt. % Č (4); Č with isobutyl alc. (1:6165) forms a const.-boilg. mixt., b.p. 77.65° at 760 mm., contg. 96 wt. % Č (4); Č with EtOAc (1:3015) forms a const.-boilg. mixt., b.p. 75.5° at 760 mm., contg. 55 wt. % Č (23).

[For prepn. of \tilde{C} from *n*-butyl alc. (1:6180) with dry HCl gas on protracted htg. (11) (13) (24) (25), with conc. aq. HCl + ZnCl₂ (2 moles) (yields: 76-78% (26) (27) (29), 66-72% (30), 64-66% (28), 65% (8)) (31), other metal salts (31) (32), or H₃PO₄ (33); with PCl₃ + ZnCl₂ (60% yield (30)) (34) or PCl₃ + pyridine (for important study of mechanism see (35) (36)); with PCl₅ + ZnCl₂ (74% yield (30)) cf. (35) (36); with SOCl₂ + pyridine (71% yield (8)) (for important study of mechanism see (37) (36)) see indic. refs.]

[For formn. of \bar{C} from *n*-butyl HSO₄ with HCl (25); from *n*-butyl MgBr with *p*-toluene-sulfonyl chloride (8.7% yield (38)); from *n*-butyl *p*-toluene-sulfonate as by-prod. of its reactn. with benzyl MgCl in prepn. of *n*-amylbenzene (39) cf. (40) (41); from *n*-butyl iodide with HgCl₂ in s.t. at 120–130° for 2 hrs. (10); from *n*-butylamine with HNO₂ (5.2% \bar{C} accompanied by 36.5% butenes + 25% butanol-1 + 13.2% butanol-2 + 2.8% 2-chlorobutane (42)); from *n*-butane with Cl₂ at 400–475° (together with other prods. (3)) see indic. refs.]

[For use as denaturant for alc. see (43) (for detn. of \bar{C} in denatured alc. see (4)); for use in removal of water from volatile fatty acids see (45); for study of anthelmintic props. see (46).]

Pyrolysis of \bar{C} . [\bar{C} at 450-650° without catalyst loses HCl and yields exclusively butene-1 (3) (47); however, \bar{C} passed at 450° over CaCl₂ cat. gives mixt. contg. 20% butene-1 + 80% cis + trans isomers of butene-2 (3) (47) (for influence of other cat. cf. (48) (49)).]

Further halogenation of C. [C with Cl₂ under various conditions (50) (51) (52) (53) (54) (5) gives a mixt. of 1,1-dichlorobutane (3:7550), 1,2-dichlorobutane (3:7680), 1,3-dichlorobutane (3:7925), and 1,4-dichlorobutane (3:5835) (together with higher chlorination prods.); note that the chlorination is facilitated by peroxides or by light but inhibited by O₂ (e.g., C with Cl₂ in absence of air at 0° in dark reacts 7% in 20 hrs. but in pres. of 2 mole % ascaridole 85% in same time or in light 100% in 1 min.; in pres. of 2% O₂ in dark no reactn. occurs in 96 hrs. (18). — C (2.5 moles) with SO₂Cl₂ (1 mole) + trace dibenzoyl peroxide 3 hrs. under reflux in the dark gives (55) mixt. contg. 25% 1,2-dichlorobutane (3:7680) + 50% 1,3-dichlorobutane (3:7925) + 25% 1,4-dichlorobutane (3:5835). — C (1 mole) with SbCl₅ (1 mole) gives on warming (56) 2,3-dichlorobutane (3:7615).]

 \bar{C} with Br₂ in pres. of Fe gives (57) 1,2-dibromobutane [Beil. I-120, I₂-(83)], b.p. 166°. Reactions of the halogen atom of \bar{C} . Note that in \bar{C} the chlorine atom is much less

reactive than that of sec.-butyl chloride (3:7125) or ter-butyl chloride (3:7045).

[For study of hydrolysis of C in pres. and abs. of acid see (58).]

[For study of rate of reactn. of C with LiI, NaI, or KI in acctone see (59) (60).]

[For study of rate of reactn. of C with Na n-propylate see (61).]

[Č with aniline as directed yields (62) N-(n-butyl)aniline and/or N,N-di-(n-butyl) aniline; for analogous study of Č with N-methylaniline (63), N-ethylaniline (63), o-toluidine (64), p-toluidine (64), unsym.-m-xylidine (65) see indic. refs.]

[\bar{C} with C_6H_6 + AlCl₃ gives (69% yield (66)) sec.-butylbenzene (1:7490) (note isomerization of carbon chain) (for comparison of reactivity of \bar{C} with other *n*-butyl halides see (67)); \bar{C} with C_6H_6 + Al/Hg gives both (68) sec.-butylbenzene (1:7490) and *n*-butylbenzene

(1:7515). — Č with toluene + AlCl₃ gives (45% yield (69) of a mixt. of both m- and p-sec.-butyltoluenes.]

[$\check{\mathbf{C}}$ with $\mathbf{C_6H_6}$ in dry liq. HCl at 195° under press. gives (70) 30% yield sec.-butylbenzene (1:7490) + 60% di-(sec.-butyl)benzene; for analogous behavior of $\check{\mathbf{C}}$ with toluene see (70).] [$\check{\mathbf{C}}$ with CO + AlCl₃ or similar cat. under press. yields (71) acids and ketones.]

Reaction of \tilde{C} to form organometallic cpds. [\tilde{C} with metallic Li in dry ether under N₂ gives (yields: 75–80% (72), 77% (73), 70–75% (74)) n-butyllithium (for study of rate of formn. of n-BuLi as compared with n-BuBr, C_0H_0Br , C_0H_0Br , C_0H_0Br , C_0H_0Br , C_0H_0Br , C_0H_0Rr see (85)); this prod. with dry CO₂ in ether at 0° gives (45% yield (75)) di-n-butyl ketone (1:5493) or with CO₂ in C_0H_0 at room temp. also (75) tri-n-butylcarbinol; for study of relative reactivity of n-BuLi as compared with n-BuMgBr, C_0H_0 MgBr, etc., see (76); note, however, that full chemistry of n-BuLi cannot be discussed here.]

[\bar{C} with metallic Na in pet. ether yields (77) *n*-butylsodium; on carbonation with CO₂ this prod. gives (77) (78) (80) both *n*-valeric acid (1:1060) and *n*-propylmalonic acid; for study of reactn. of *n*-BuNa with C₆H₆ see (77); note, however, that full chemistry of *n*-BuNa cannot be covered here.]

 \bar{C} with Mg in dry ether gives (yields: 98.5% (81), 91.2% (82) (83), 85% (84)) n-BuMgCl; for studies on rate of forms. of n-BuMgCl (as compared with C_6H_6MgBr , or with other n-Bu halides, etc.) (85), on effect of rapid addn. of \bar{C} on yield (83), on effect of concentration of \bar{C} (84) see indic. refs.; for study of equilibrium composition of ether solns. of n-BuMgCl see (86) (87); for study of competitive reaction of mixts. of \bar{C} with n-BuBr and with n-BuI in forms. of RMgX see (88). — For certain important reactions of n-BuMgCl see below but note that full chemistry of this cpd. cannot be included here.

[\bar{C} with Mg + trace of I₂ but without solvent at 79-82° for 3 hrs. gives (10% yield (89)) n-octane (1:8655); \bar{C} + Mg + I₂ in toluene in similar fashion gives (6% yield (89)) p-(n-butyl)toluene.]

- © n-Valeric acid (1:1060) q.v. [From \bar{C} by conversion to n-BuMgCl (see above) and carbonation with CO₂ (yields: 72-73% (90), 80% (91)) (note that this prod. may be accompanied by more or less di-n-butyl ketone (1:5493) and tri-n-butylcarbinol (91)), or by conversion of \bar{C} with KCN to n-valeronitrile and hydrolysis of the latter with 67% H₂SO₄ (52) (92).]
- n-Valeranilide: m.p. 62-63° u.c. (93), 63° cor. (94). [From Č by conversion to n-BuMgCl (see above) and reactn. in dry ether with phenyl isocyanate (93) (42) cf. (93).]
- ① n-Valero-p-toluidide: m.p. 72-73° u.c. (93). [From \bar{C} by conversion to n-BuMgCl (see above) and reactn. in dry ether with p-tolyl isocyanate (93).] [Note that this derivative does not afford good distinction from n-amyl chloride (3:7460) for which the corresp. n-capro-p-toluidide has m.p. 74-75° u.c. (93).]
- D n-Valero-α-naphthalide: m.p. 109-110° u.c. (93). [From Č by conversion to n-BuMgCl (see above) and reactn. in dry ether with α-naphthyl isocyanate (93).] [Note that this derivative does not afford good distinction from isoamyl chloride (3:7365) for which the corresp. isocaproic α-naphthalide has m.p. 110-111° u.c. (93).]
- ---- n-Butyl mercuric chloride (n-BuHgCl): m.p. 130° cor. (95), 129° (96), 127.5° (98), 126° (96), 125.5° (97), 125° (99). [Prepd. indirectly but should be easily preparable from n-BuMgCl + HgCl₂ cf. (98), since it has been similarly prepd. from n-BuMgBr (95).]
- S-(n-Butyl)isothiourea picrate: m.p. 177° (100). [From Č (1 g.) with thiourea (1 g.) in alc. (10 ml.) on refluxing for 2 hrs., then adding PkOH (1 g.), htg. until a clear soln. results, then cooling (100).]—[Note that this derivative does not dis-

- tinguish \tilde{C} from *n*-propyl chloride (3:7040) for which the corresp. S-(*n*-propyl)-isothiourea picrate has m.p. 176° (100), nor from isoamyl chloride (3:7365) for which the corresp. S-(isoamyl)isothiourea picrate has m.p. 173° (100).]
- —— N-(n-Butyl)phthalimide (1-(N-phthalimido)butane): cryst. from dil. AcOH, m.p. 34° (101), b.p. 311.8° cor. at 758 mm. (102). [Prepd. indirectly from n-butyl-amine (101) (102); direct prepn., e.g., from C + K phthalimide in pres. of KI never reported and m.p. too low to serve as good derivative.]
- N-(n-Butyl)-3-nitrophthalimide: pr. from CS₂, m.p. 71-72° (103). [From C with
 K 3-nitrophthalimide on refluxing for 10 hrs. (103); for photographs of crystals see
 (104).]
- N-(n-Butyl)tetrachlorophthalimide: pl. from alc., m.p. 153-154° (105). [From C with K tetrachlorophthalimide by htg. at 200° for 10 hrs. (105).]
- N-(n-Butyl)saccharin: cryst. from dil. alc., m.p. 38° (106). [From C with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on refluxing for 30 min. (106).]
- —— N-(n-Butyl)-N-(p-bromobenzenesulfonyl)-p-anisidide: cryst. from 75% alc., m.p. 74.5° u.c. (107). [This prod. has not been reported from C but has been obt. from n-BuBr with N-(p-bromobenzenesulfonyl)-p-anisidide in alc. KOH after 1 hr. reflux (107).]
- —— p-(n-Butoxy)benzoic acid: m.p. 147-148° (108), changing to a cloudy viscous liq. clearing sharply at 160° (108) cf. (109). [From $\bar{\mathbb{C}}$ with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (108)]. [Note, however, that this prod. does not distinguish $\bar{\mathbb{C}}$ from n-propyl chloride for which the corresp. p-(n-propoxy)benzoic acid has m.p. 145.5-147°; the two prods. do, of course, have slightly different Neut. Eqs.]
- --- n-Butyl 2,4,6-triiodophenyl ether: m.p. 66° cor. (110). [This prod. has not been reported for C itself but has been obtd. from n-BuBr with 2,4,6-triiodophenol in abs. alc. NaOEt on refluxing for 30 min. (110).]
- —— n-Butyl α-naphthyl ether: b.p. 308.5° cor. (111), 310° (112) (corresp. picrate, m.p. 85.0° cor., Neut. Eq. 429 (111)).
- ---- n-Butyl β-naphthyl ether: b.p. 309.0° cor. (111), 311° (112); m.p. $33.0-33.5^{\circ}$ (111) (corresp. picrate, m.p. $67.0-67.5^{\circ}$ cor. (111), 67° (113)).

3:7165 ter-BUTYL HYPOCHLORITE (CH₃)₃C—OCl C₄H₉OCl Beil. I — (Trimethylcarbinyl hypochlorite) I₁— I₂-(415) B.P. 79.6° at 750 mm. (1)
$$D_4^{18} = 0.9583$$
 (1) 77-79° (16)

Pale yellow mobile liquid with characteristic irritating odor. — \bar{C} violently attacks the eyes and mucous membranes. — \bar{C} is relatively stable and if protected from bright light can be kept at ordinary temps. for months with little or no decomposition (1). \bar{C} should, however, be handled with care since it is particularly susceptible to photochemical decomposition which may occur with explosive violence (2).

[For prepn. of \tilde{C} from *ter*-butyl alcohol (1:6140) + Cl₂ + alk. in pract. quant. yield see (1) (2) (3), 60% yield (16); from *ter*-butyl alc. (1:6140) + HOCl in CCl₄ see (15); for manufacture of \tilde{C} see (4).] [For use in bleaching of textles, fruits, etc., see (5) (6) (7).]

[For general survey of reactns. of \bar{C} see (8); for study of reactns. of \bar{C} with olefins (2) (13) (16) (17) (18) or olefins contg. activating groups (9) (10), with group $R_2C=N.MgX$ (3), or with Schiff's bases (11) (12) see indic. refs.; for study of \bar{C} in Friedel-Crafts reactn. see (14).]

Č on sufficient htg. or on exposure to bright sunlight yields (1) acetone (1:5400) + methyl chloride (3:7005). — [For data on stability of Č in aq. or in CCl4 see (15).]

 \bar{C} with aq. KI acidified with AcOH yields I_2 (use in detn. of \bar{C} (1)).

B.P. F.P. 80° (1) (2) (3)
$$-94.0^{\circ}$$
 (9) $D_4^{25} = 1.0508$ (10) $n_D^{25} = 1.4057$ (1) 79-80° (4) 78.3° at 766 mm. (5) $D_-^{25} = 1.0469$ (1) 78.3° (6) 77.8-78.3° at 723.7 mm. (7) $D_4^{20} = 1.0646$ (7) $n_D^{20} = 1.4057$ (7) 77-78.5° (8) 1.0565 (5) 1.4038 (5)

[For prepn. of Č from propionic acid (1:1025) with PCl₅ (77% yield (11)), with PCl₃ (yields: 67.5% (12), 61% (13), 48% (14)) (15) (16) (note that excess PCl₃ may not be

used since its b.p., 76°, is too close to that of \bar{C} for subsequent sepn.), with PCl₃ + ZnCl₂ (91% yield (11)), with SOCl₂ (4) (note that excess SOCl₂ may not be used since its b.p., 79°, is almost identical with that of \bar{C}), with benzoyl chloride (3:6240) (yield 84-89% (8)) (17), with sodium chlorosulfonate (18), with benzenesulfonyl chloride + NaCl (18), with Cl₂ + S₂Cl₂ in cold (37% yield (19)), with SiCl₄ in xylene at 50° (50% yield (20)), or with acetonitrile + HCl gas at 0° (21) see indic. refs.; for prepn. of \bar{C} from propionic anhydride (1:1100) with phosgene (3:5000) + cat. as directed see (22).]

[\bar{C} with Cl₂ (67) in CCl₄ in sunlight (15) at 0° (23) or in dark at 40° (24) or \bar{C} with SO₂Cl₂ in CCl₄ in pres. of dibenzoyl peroxide refluxed 4–6 hrs. in dark (25) gives a mixt. contg. mainly β -chloropropionyl chloride (3:5690) accompanied also by α -chloropropionyl chloride (3:5320) yield: 60% β isomer + 40% α isomer (25)); note that in the pres. of I₂ instead of dibenzoyl peroxide only α -chloropropionyl chloride (3:5320) (45% yield (26)) is produced (25).]

[$\ddot{\mathbf{C}}$ with Br₂ (1 mole) at 80° evolves HCl and gives (100% yield (12)) (27) (28) α -bromopropionyl bromude [Beil. II-256, II₂-(230)], b.p. 153-155° (12); the reaction is accelerated by light, but the photobromination is retarded by O₂ (29).]

[C with Na propionate on htg. (14) (30) or C with Ag propionate on distn. (31) gives (80% yield (31)) propionic anhydride (1.1100).]

 $[\bar{C}$ passed over heated Ni cat. decomposes (32) into ethylene, HCl + CO, accompanied by smaller amts. methane, hydrogen, and CO₂. — \bar{C} with Na in abs. ether is claimed (33) to yield the dipropionate of hexen-3-diol-3,4 [Beil. II-242], b.p. 108-109° at 10 mm. (33).]

[C with ter-butyl MgBr in dry ether yields (34) not only the expected coupling product ter-butyl methyl ketone (pinacolone) (1:5425) but also diethyl ketone (1:5420), propanol-1 (1:6150), and propionic acid (1:1025) accompanied by the propionates of ter-butyl-ethyl-carbinol (2,2-dimethylpentanol-3) [Beil. I₁-(207), I₂-(446)] and of diethylcarbinol (pentanol-3) (1.6175) (reduction products). — C with C₆H₅MgBr in ether gives (57% yield (35)) diphenyl-ethyl-carbinol [Beil. VI-687, VI₁-(331)], m.p.95°, but C with C₆H₅MgBr with CdCl₂ in ether gives (76% yield (36)) ethyl phenyl ketone (propiophenone) (1:5525).]

 $[\bar{C}+2,5$ -dimethylpyrrole N-magnesyl bromide in dry ether gives (by rearr.) (37) 3-propionyl-2,5-dimethylpyrrole, colorless cryst. from AcOH, m.p. 102.5° (37); \bar{C} with benzimidazyl N-magnesyl bromide in dry ether yields (38) (39) N-(propionyl)benzimidazole, m.p. 125° (38) (39) (corresp. picrate, m.p. 228° (38) (39)).]

 $[\bar{C} + \text{ethyl acetoacetate} + \text{Mg in } C_6H_6 \text{ refluxed 2 hrs., treated with aq. gives (36% yield (40)) ethyl <math>\alpha$ -propionylacetoacetate, b.p. $104-106^\circ$ at 12 mm. (40) (isolated as Cu enolate, m.p. $78-79^\circ$, blue ndls. from MeOH/aq.; violet ndls. from pct. ether (40)).]

[\bar{C} with FeCl₃ (1 mole) on warming evolves HCl and gives a prod. which with aq. gives (34% yield (41)) (42) diethyl ketone (1:5420) + CO₂, or with alc. yields (43) ethyl α -propionylpropionate [Beil. III-686, III₂-(436).]

[Č with equal wt. CISO₃H stood at room temp. 5–10 days, poured into aq. (44), or Č with tripropylamine in lgr. (45) gives (cf. (42)) in small yield 3,5-dimethyl-2-ethyl-6-hydroxypyrone-4 [Beil. XVII-453], cryst. from aq. or AcOH, m.p. 151° (45).]

[$\bar{\mathbb{C}}$ with olefins or cyclo-olefins (cyclenes) in pres. of cat. adds to unsatn. yielding chloro-ketones; e.g., $\bar{\mathbb{C}}$ with ethylene + AlCl₃ at 0° gives (50% yield (46)) (47) β -chloroethyl ketone (1-chloropentanone-3) (3:9268); $\bar{\mathbb{C}}$ with trimethylethylene (2-methylbutene-2) (1:8220) + SnCl₄ gives (57% yield (48)) 2-chloro-2,3-dimethylhexanone-4, b.p. 74-78° at 17 mm., $D_4^{16} = 0.975$ (48) (note that this prod. on htg. with dimethylaniline loses HCl giving (60% yield (48)) of a mixt. of 2,3-dimethylhexen-2-one-4, b.p. 164-166° at 750 mm., $D_4^{13} = 0.872$, $n_D^{13} = 1.4535$ (semicarbazone, m.p. 209° (48)) and 2,3-dimethylhexen-1-one-4, b.p. 158-162° at 750 mm., $D_4^{13} = 0.862$, $n_D^{13} = 1.4450$ (semicarbazone, m.p. 108-110° (48)); $\bar{\mathbb{C}}$ with cyclohexene (1:8070) + SnCl₄ gives a prod. which with dimethylaniline loses HCl

to cyclohexen-1-yl ethyl ketone, b.p. 90° at 10 mm., $D_4^{13.5} = 0.981$, $n_D^{13.5} = 1.5005$ (oxime, m.p. 79°, semicarbazone, m.p. 195° (49)). — Note, however, that addn. of $\tilde{\mathbf{C}}$ to certain types of olefins is followed by *spontaneous* loss of HCl so that the unsatd. ketone forms the direct product; e.g., $\tilde{\mathbf{C}}$ with isobutylene (2-methylpropene-1) + SnCl₄ gives (30% yield (48)) 2-methylhexen-2-one-4, b.p. 147-148° at 760 mm., $D_4^{15} = 0.859$, $n_D^{15} = 1.4496$ (48) (semicarbazone, m.p. 163° (48)).]

[\bar{C} with aromatic hydrocarbons + cat. evolves HCl yielding corresp. ketones: e.g., \bar{C} with C_6H_6 + AlCl₃ in CS₂ gives (84% yield (19)) (50) ethyl phenyl ketone (propiophenone) (1:5525); \bar{C} with toluene (1:7405) + AlCl₃ in CS₂ gives (yields: 60% (51), 50% (52)) (53) ethyl p-tolyl ketone [Beil. VII-317, VII₁-(170)], b.p. 238-239°; for analogous reactions of \bar{C} with o-xylene (1:7430) (54), 2-methylnaphthalene (1:7605) (55), anthracene (1:7285) (56), phenanthrene (1:7240) (57), or acenaphthene (1:7225) (58) see indic. refs.; for analogous reactions of \bar{C} with heterocyclic systems, e.g., \bar{C} + 2-nitrofuran + TiCl₄ (59) or \bar{C} + thiophene + P_2O_5 at 210° for 10-12 hrs. (60), see indic. refs.]

[\bar{C} with alcs. reacts normally yielding corresp. esters: e.g., \bar{C} with MeOH yields methyl propionate (1:3020), \bar{C} with EtOH yields ethyl propionate (1:3070), etc.; for use of Mg in reaction of \bar{C} with tertiary alcs., e.g., \bar{C} + ter-butyl alc. (1:6140) + Mg giving (68% yield (61)) ter-butyl propionate, b.p. 115–116.5° (61), or \bar{C} + ter-amyl alc. (1:6160) + Mg giving (75% yield (61)) ter-amyl propionate, b.p. 153–156° at 710 mm. (61), see indic. refs.)

[\tilde{C} with phenols gives the corresp. phenol esters: e.g., \tilde{C} with phenol gives (62) phenyl propionate (1:3696), etc.; note, however, that these phenol esters on htg. with AlCl₃ in appropriate solvents, especially nitrobenzene, undergo the Fries rearr. yielding o- and p-propiophenols; this complete sequence is often carried through without isolation of the intermediate ester, e.g., for \tilde{C} + phenol + AlCl₃ giving directly o-hydroxypropiophenone [Beil. VIII-102, VIII₁-(547)] (50% yield) and p-hydroxypropiophenone [Beil. VIII-102 (25% yield) see (63); for key refs. on direct rearr. of phenyl propionate to these products see (64) (65); scores of analogous cases with other phenols or their ethers cannot be included here.]

[Č with certain hydroxy-azo-compounds in dry ether yields addn. cpds. usually (but not always) of 1:1 type: e.g., Č with p-hydroxy-azobenzene [Beil. XVI-96, XVI₁-(233)], m.p. 152°, in dry ether on stdg. at room temp. ppts. 1:1 cpd., m.p. 162° (66); for numerous analogous cases using homologous hydroxy-azo cpds. see (66).]

 $\ddot{\mathbf{C}}$ hydrolyzes with aq. yielding propionic acid (1:1025); for the amide, anilide, p-toluidide, and other derivs. corresp. to $\ddot{\mathbf{C}}$ see under propionic acid (1:1025).

-2°	at 18 mm. (6)		

Because of the close interrelationship of \bar{C} with the isomeric 3-chlorobutene-1 (3:7090) some confusion exists regarding the nomenclature. The compound here described (1-chlorobutene-2) is by some authors designated as crotyl chloride; this name, however, is better reserved for the equilibrium mixture of 1-chlorobutene-2 and 3-chlorobutene-1 as indicated by $\langle 7 \rangle$.

Pure \bar{C} (in the absence of catalysts) is quite stable (1) and may be kept at room temperature as long as a year (5) without significant increase in n_2^{20} . However, in the presence of FeCl₃, HCl, or CuCl₂ + HCl, \bar{C} is in part isomerized to 3-chlorobutene-1 and an equilibrium mixt. is formed. The composition of this equilibrium mixt. depends upon the temperature, catalyst, and other factors. E.g., with FeCl₃ the equilibrium mixt. conts. 50% \bar{C} ; with 1 mole HCl it conts. 75% \bar{C} . Although the two compounds can easily be separated by careful fractional distillation (5) yet consideration must always be given to the possible formation during chem. reaction of the derivatives of the other isomer. The refractive index of mixts. of 1-chlorobutene-2 and 3-chlorobutene-1 is a linear function of the composition (1). Although cis and trans stereoisomers of \bar{C} are possible, no record of their isolation has been published.

[For the prepn. of a mixt. of \bar{C} + 3-chlorobutene-1 from butadiene-1,3 + HCl see (1) (7) (8) (9); for prepn. of \bar{C} from crotonyl alcohol with PCl₃ + pyridine see (3) (6), with HCl + Cu₂Cl₂ see (1), with conc. HCl see (5).]

C passed over soda-lime in an iron furnace at 530-550° yields (11) butadiene-1,3. [Use in prepn. of 1,2,3,4-tetrabromobutane (11).]

[For study of reactivity of \bar{C} with KI soln. at 20° or NaOEt soln. at 20° and 50° see (3); for reaction with Mg, Zn, etc., see (12); for use in formn. of cellulose ethers see (13); for study of hydrolysis of \bar{C} under various conditions see (16); for behavior of \bar{C} with cuprous cyanide see (17).]

— Crotonyl 3,5-dinitrobenzoate: cryst. from alc., m.p. 54° (9). [This cpd. has never been reported from \bar{C} but only (cf., however (15)) from the corresp. bromide via reaction with silver 3,5-dinitrobenzoate in ether (9), it is possible that the material of m.p. 54° represents a mixt. of the two esters corresponding to crotonyl bromide and the isomeric 3-bromobutene-1 since from the former a 3,5-dinitrobenzoate, m.p. 51°, 50-51° (15), and from the latter a 3,5-dinitrobenzoate, m.p. 59°, have been reported (14).

3: 7212 CHLOROACETALDEHYDE CH₂—CHO C₂H₃OCl Beil. I - 610
$$I_{1-}(327)$$
 Cl $I_{2-}(675)$ B.P. 85–86° (1)

85.0-85.5° cor. at 748 mm. (2) 84.5-85° at 759 mm. (3)

Colorless liq. with sharp and penetrating odor; vigorously attacks mucous membrane. — \bar{C} with aq. forms (2) a crystn. hemihydrate, \bar{C} . ½ H_2O ; this does not have a sharp m.p. but about 43–50° begins to liquefy and on further htg. yields \bar{C} , whose vapor may be dried by passing over anhydr. CuSO₄ (2) (3); this hemihydrate is sol. in aq. from which it may be recovered by evaporation in a stream of dry CO_2 ; it is also sol. in alc. or ether, sepg. unchanged on evapn. of solvent (2) (for prepn. (60% yield) from glycerol α -monochlorohydrin (3:9038) by oxidn. with HIO₄ see (40)). — \bar{C} also forms (4) with EtOH a liq. chloroacetaldehyde ethylaleoholate (chloroacetaldehyde ethyl-hemi-acetal), but in excess alc. on protracted stdg. at room temp. (4) this is converted to chloroacetaldehyde diethylacetal (3:8228), or on treatment with dry HCl yields (4) α , β -dichloroethyl ethyl ether (3:5640).

[For prepn. of \bar{C} from its crystn. trimer (3:2300) by distn. at ord. press. see (2) (5) (6); from chloroacetaldehyde diethylacetal (3:8228) by htg. at 150° in CO₂ with anhydr. oxalic acid (2), AcOH (2), or dil. H₂SO₄ (2) (7) see indic. refs.; from chloroacetaldehyde ethylalcoholate (see above) by htg. with anhydr. oxalic acid at 150° (90% yield) see (8) (note that the actn. of Cl₂ on paraldehyde (1:0170) gives acc. to conditions either \bar{C} (9) or α,α,β -trichloro-n-butyraldehyde (butylchloral) (3:5910) (10) (11)).]

[For prepn. of \tilde{C} from vinyl chloride (3:7010) with $Cl_2 + aq$. in the dark at 35° see (12) (13) (14) (15); from methylene dichloride (3:5020) with formaldehyde + SO_2Cl_2 at 300° with cat. see (16); from α,β -dichloroethyl ethyl ether (3:5640) with conc. H_2SO_4 see (17); from α,β -dichloroethyl acetate on distn. with a little ZnCl₂ (acetyl chloride also formed) (18) or from α,β -dichloroethyl benzoate similarly (benzoyl chloride also being formed) (19) or from α,β -dichloroethyl laurate (lauroyl chloride also being formed) (19) see indic. refs.]

[For form. of \tilde{C} from sodium β,β -dichloro- α -hydroxypropionate on boilg. with aq. see (20); from β -chloroethylidene-diurethane on warming with dil. HCl see (21); from acetaldehyde (1:0100) with ethyl hypochlorite followed by distn. with anhydr. oxalic acid see (22); from chloroacetaldehyde-sulfonic acid [Beil. I₂-(818)] by treatment with steam in 60% H₂SO₄ (23) or by htg. with 80% H₂SO₄ (24) see indic. refs.]

 \bar{C} gives positive fuchsin-aldehyde test (1). — \bar{C} reduces NH₄OH/AgNO₃ on warming (2). \bar{C} does not oxidize in the air (2) but is oxidized by conc. HNO₃ (2) (20) or by AgOH (20) or by dil. H₂O₂ (25) to chloroacetic acid (3:1370). — \bar{C} on treatment as directed (26) with halogen magnesium alcoholate (e.g., EtOMgCl) is reduced to β -chloroethanol (3:5552).

 \bar{C} on stdg. in s.t. is rapidly converted to an amorphous polymer (2); \bar{C} (or its hemihydrate) on shaking with $\frac{1}{2}$ vol. cold conc. H₂SO₄ yields (1) a cryst. trimer, 2,4,6-tris-(chloromethyl)-trioxane-1,3,5 (3:2300), m.p. 87-87.5°, which on distn. at ord. press. depolymerizes to \bar{C} .

The hemihydrate of \bar{C} htd. alone or in pres. of a few drops of conc. H_2SO_4 condenses with itself yielding (27) (28) α, γ -dichlorocrotonaldehyde [Beil. I-731, I₂-(789)].

[\bar{C} warmed with EtOH (4) or the ethylalcoholate of \bar{C} in EtOH treated with dry HCl gas (8) yields chloroacetaldehyde diethylacetal (3:8228), b.p. 157°, and in the latter case also (4) α,β -dichloroethyl ethyl ether (3:5640).]

[\bar{C} with KCN yields (29) (7) an oily prod. (cyanohydrin?) which by hydrolysis with HCl gives β -chlorolactic acid [Beil. III-286, III₁-(110), III₂-(209)] + AcOH; \bar{C} + NaCN+BzCl yields (30) α -benzoxy- β -chlorolactonitrile; note, however, that \bar{C} boiled with alc. KCN yields (31) EtOAc, or with aq. KCN yields (31) AcOH.]

[For behavior of \tilde{C} with AcCl (2), Ac₂O (32), see indic. refs.; \tilde{C} with ethyl diazoacetate yields (3) ethyl γ -chloroacetoacetate (3:6375); \tilde{C} with EtMgBr in ether yields (6) 1-chlorobutanol-2 (3:8025); \tilde{C} with nitromethane as directed (33) yields 1-chloro-3-nitropropanol-2, with nitroethane, 1-chloro-3-nitrobutanol-2; \tilde{C} with thioformamide (35) or \tilde{C} + formamide + P₂S₅ (34) yields thiazole [Beil. XXVII-15, XXVII₁-(207)], m.p. 116°.]

- Chloroacetaldoxime: lachrymatory oil dec. on distn. at 10 mm. (36). [From Č with 4 moles NH₂OH.HCl (36).]
- © Chloroacetaldehyde semicarbazone: ndls. from alc., m.p. 148° (37), 134-135° dec. (38), 134° (40). [From C + semicarbazide hydrochloride + NaOAc (37).]
- Chloroacetaldehyde dimethone: unreported. [Note that Č with warm alc. soln. of "dimethone" ("dimedone") (dimethyldihydroresorcinol) not only condenses normally but also loses HCl yielding (39) same prod., m.p. 227° u.c., 237.5° cor. (39), as obtd. from hydroxyacetaldehyde.]

 \bar{C} with aq. forms binary const.-boilg. mixt., b.p. 76° (2); \bar{C} with aq. + ter-amyl alc. (1:6160) forms a ternary const.-boilg. mixt. (2).

[For prepn. of \bar{C} from ter-amyl alc. (1:6160) with HCl gas see (11); with conc. HCl (yield: 93–98% (12), 65% (13)) see (12) (13); with PCl₃ (41% yield (6)) or PCl₃ + ZnCl₂ (98% yield (14)) see (6) (14); with PCl₅ (80% yield (14)) see (1) (14); with SOCl₂ (yield: 99% (14), 41% (6)) see (14) (6); with acetyl chloride see (6); with oxalyl chloride (3:5060) (yield 18% (6)) see (15) (6); with diphosgene (3:5515) see (16); with p-nitrobenzoyl chloride see (17).]

[For prepn. of C from isopropyl-methyl-carbinol (2-methylbutanol-3) (1:6170) by

rearr. with conc. HCl + ZnCl₂ (80% yield (7)), or with HCl on long stdg. (97% yield (7)), or with PCl₅ (76% yield (7)), or with SOCl₂ + pyridine (73% yield (7)) see (7).]

[For prepn. of C from trimethylethylene (2-methylbutene-2) (1:8220) by addn. of HCl see (18) (19) (20); from isopropylethylene (3-methylbutene-1) (1:8200) see (5).]

[For formn. of Č from 2-methylbutane (isopentane) (1:8500) by shaking 2 min. with diisobutylene hydrochloride (3:8113) + AlCl₃ see (29).]

Č very rapidly loses HCl by boilg. aq., e.g., 88.6% in 15 min., 94.9% in 30 min., 95.4% in 60 min. (7). Note that hydrolysis with hot aq. or aq. Na₂CO₃ gives exclusively olefins (20) (6) but that with cold aq. or cold aq. NaOH some ter-amyl alc. (1:6160) is also formed (20), although the latter may result from hydration of the olefin. [For further studies of hydrolysis of Č see (2) (6) (20) (21) (22).]

 $\bar{\rm C}$ on passing over BaCl₂ + soda-lime at 350–400°C gives (85% yield (5)) a mixture of trimethylethylene (2-methylbutene-2) (1:8220) + unsym.-ethyl-methyl-ethylene (2-methylbutene-1) (1:8210).

Č with Mg in dry ether gives (yield: 73.6% (23), 38% (26)) RMgCl; this with CO₂ gives (60% yield (13)) dimethyl-ethyl-acetic acid (1:1113) q.v. (see also derivatives below). Č with Ag 3,5-dinitrobenzoate does not (24) yield expected ter-amyl 3,5-dinitrobenzoate

- Dimethyl-ethyl-acetanilide: m.p. 90-91° u.c. (25), 92° cor. (26), 91.4° (27). [From RMgCl + phenyl isocyanate (25) (26).] [Note that this same product results by rearr., however, from similar treatment of the RMgCl cpds. from 3-chlor-2-methyl-butane (3:7275) q.v.]
- ① Dimethyl-ethyl-acet-p-toluidide: m.p. $83.0-83.5^{\circ}$ u.c. (25), 83.3° (27). [From RMgCl + p-tolyl isocyanate (25).]
- Dimethyl-ethyl-acet-α-naphthalide: m.p. 137-138° u.c. (25). [From RMgCl + α-naphthyl isocyanate (25).]

3:7225 4-CHLOROBUTADIENE-1,2 Cl C₄H₅Cl Beil. S.N. 12 H₂C—CH—C—CH₂

B.P. 88° (1)

Č represents the initial step in the formn. of 3-chlorobutadiene-1,3 ("Chloroprene") (3:7080) by addn. of aq. HCl (1) (2) to vinylacetylene; under certain conditions Č can

be isolated as the major reactn. product, but it readily undergoes isomerization to "Chloroprene" especially in the presence of certain salts, e.g., CuCl (3). When sufficient HCl is present the reactn. proceeds further (1) with formn. of 2,4-dichlorobutene-2 (3:5550).

 \ddot{C} shaken with 3 pts. 18% HCl contg. CuCl for 16 hrs. at 20° gives (4) (3) (2) butadiene-1,3 ("Chloroprene") (3:7080), the rest being chloroprene polymer. — \ddot{C} with 3% dry FeCl₃ spontaneously evolves heat and yields (4) chloroprene (3:7080).

 \bar{C} stirred with aq. Na₂CO₃ at 60–90° for 15 hrs. gives (10) (50% yield (4)) 4-hydroxy-butadiene-1,2, colorless lachrymatory, strongly vesicant liq. with sharp pungent odor, misc. aq. and org. solvents, b.p. 126–128° at 756 mm., 68–70° at 53 mm., $D_4^{20} = 0.9164$, $n_2^{20} = 1.4759$. [This prod. on cat. hydrogenation gives (4) butanol-1 (1:6180) but is unaffected by refluxing with alc. NaOEt, 25% aq. H₂SO₄, or 2% aq. HCl; for many other reactns. and derivatives see (4) (10).]

 \tilde{C} in 80% alc. or in acetone with NaI, stood for 3 hrs. then diluted with aq., gives (46% yield (4)) 4-iodobutadiene-1,2, b.p. 43-45° at 38 mm., $D_D^{20} = 1.7129$, $n_D^{20} = 1.5709$ (4), which on htg. at 125-130° polymerizes vigorously to iodoprene. — \tilde{C} with alc. NaCN yields (5) 4-cyanobutadiene-1,3 (β -vinylacrylonitrile), b.p. 135-138° at 760 mm., 65-68° at 58 mm., 48-50° at 28 mm., $D_A^{20} = 0.8644$, $n_D^{20} = 1.4880$ (5). — \tilde{C} with liq. NH₃ at -40 to -50° yields (6) (7) tris-(butadien-1,2-yl-4)amine (for extension to many other amines see (7)).

 \bar{C} added dropwise to 3 vols. conc. H₂SO₄ at -5° to $+3^{\circ}$, then poured onto ice, yields (1) 4-chlorobutanone-2 (3:7640), b.p. 120-122° at 760 mm. (1).

C with Cl₂ yields (8) (9) mixt. of 2,3,4-trichlorobutene-1 (3:9064) and 1,2,4-trichlorobutene-2 (3:9062) which reacts further to produce 1,2,2,3,4-pentachlorobutane (3:9070).

 \bar{C} in aq. Na₂CO₃ suspension, oxidized with KMnO₄, yields (1) chloroacetic acid (3:1370), but neither acetic acid nor oxalic acid. — \bar{C} in CHCl₃ treated with O₃ for 12 hrs. at 0°, then with aq., yields (1) formaldehyde (1:0145) and chloroacetaldehyde (3:7212) (the latter not detected directly but only after KMnO₄ oxidn. (1) to chloroacetic acid (3:1370)).

3:7225 (1) Carothers, Berchet, Collins, J. Am. Chem. Soc. 54, 4066-4070 (1932). (2) Klebanskii, Tzyurikh, Dolgopol'skii, Bull. acad. sci. Soc. 33, 496-501 (1901); Cent. 1901, II 1201.

3: 7240 3-CHLOROPENTENE-2 Cl
$$C_bH_9Cl$$
 Beil. I — I_1 — I_2 — CH_3 . CH_2 — CH_3 . CH_3 — CH_3 . CH_3 C

Two geometrical stereoisomers of C are possible but as yet unrecognized.

[For prepn. of \tilde{C} (together with 2-chloropentene-2 (3:7285) and other prods.) from methyl n-propyl ketone (1:5415) with PCl₅ see (1); for prepn. of \tilde{C} (together with other prods.) from diethyl ketone (propione) (1:5420) with PCl₅ (1) followed by treatment with alc. KOH (2) see (1) (2).]

Č with NaNH₂ in xylene at 130° gives (3) a little pentyne-2 (1:8040) and on subsequent pouring of the reacts, mixt, into water also pentyne-1 (1:8025).

3:7246 (1) Bourgeul, Bull. soc. chim. (4) **35**, 1634-1636 (1924); Ann. chim. (10) **3**, 368-371 (1925). (2) Favorskii, Favorskaya, J. Russ. Phys.-Chem. Soc. **54**, 305 (1922); Cent. **1923**, III 1359. (3) Bourgeul, Ann. chim. (10) **3**, 221, 341 (1925); Compt. rend. **178**, 1985 (1924).

3:7260 3-CHLOROPENTENE-1 Cl
$$C_6H_9Cl$$
 Beil. I — I_1 — I_2 — CH_3 — CH_2 — CH_2 — CH_2 — CH_2 — I_2 — I_2 — I_2 — I_3 — I_2 — I_3 — $I_$

B.P. 93-94° at 759.3 mm. (1)
$$n_{\rm D}^{23} = 1.4224$$
 (4) 92-93° (2) (3) $D_{\rm D}^{20} = 0.8978$ (1) $n_{\rm D}^{20} = 1.4254$ (1) $n_{\rm D}^{20} = 1.4254$ (1)

Note: \bar{C} by virtue of facile allylic transposition is readily converted to an equilibrium mixt. with its synionic isomer, 1-chloropentene-2 (3:7470) q.v.; reactns. of \bar{C} may therefore frequently yield also the corresponding derivatives of the isomer.

[For prepn. of \bar{C} (or its mixt. with 1-chloropentene-2 (3:7470)) from ethyl-vinyl-carbinol (penten-1-ol-3) with dry HCl (1) (3) (5) (7), with aq. HCl at 0° (6), with PCl₃ at 45° (4) or in cold with pyridine (7) or dimethylaniline (7) (55-59% (7)), with SOCl₂ alone (24% yield (7)) or in ether (24% yield (7)), or with dimethylaniline (43% yield (7)) see indic. refs.] [\bar{C} is separable from the accompanying isomer by careful fractional distillation (5) (7).]

 \tilde{C} on long shaking with aq. Na₂CO₃ gives (7) in very poor yield penten-1-ol-3 accompanied by much penten-3-ol-1 and other products. — \tilde{C} with alc. NaOEt gives (4) the corresp. ethyl ether, viz., 3-ethoxypentene-1, b.p. 102°, $D_{-}^{23} = 0.7768$, $n_{D}^{23} = 1.3986$, accompanied by the isomeric 1-ethoxypentene-2, b.p. 123°, $D_{-}^{23} = 0.7930$, $n_{D}^{23} = 1.4099$ (4).

[For extensive study of behavior of \bar{C} with KOAc + AcOH, with AgOAc, with N-methylaniline, with diethylamine, etc., see (7); for reactn. of \bar{C} with phenol in pres. of K_2CO_3 + acetone see (5).]

M-(Penten-1-yl-3)phthalimide [N-(α-ethylallyl)phthalimide]: colorless cryst. from alc., m.p. 78-79° (7). [From C on htg. with K phthalimide in a s.t. at 190-200° for 2½ hrs.; yield is only about half that obtd. from 1-chloropentene-3, the corresp. deriv. of which always accompanies that from C (7).]

(7) Meisenheimer, Link, Ann. 479, 254-277 (1930).

3:7265-3:7270

Colorless liq. with odor like CHCl₃; does not fume in air (3). — Sol. in aq. at room temp. to extent of 8% by wt. (7).

[For prepn. from ethylene chlorohydrin $(3:5552) + (CH_3)_2SO_4$ (60% yield (2)) see (2); for prepn. from β -methoxyethanol (1:6405) with $PCl_3 + pyridine$ (65% yield (6)), or $SOCl_2 + dimethylaniline$ (7), or diazomethane (5) see (6) (5) (7); for prepn. from ethylene + N,N-dichlorobenzenesulfonamide see (1).]

 \bar{C} on shaking with aq. does not hydrolyze (dif. from α -chloroethers).

3: 7270 ISOBUTYRYL CHLORIDE
$$CH_3.CH-C=O$$
 C_4H_7OCl Beil. II - 293 II_{1} -(128) $CH_3.Cl$ II_{2} -(262) II_{2} -(262) B.P. F.P. 92° (1) (2) -90° (7) $D_4^{20} = 1.0174$ (8) $n_D^{20} = 1.40789$ (8) 91.5-92.5° at 748.2 mm. (8) 1.4080 (3) 91-92° (3) 1.4070 (5) 90-92° (30) 91° at 735 mm. (4) 90-91° (5) 85-88° at 680 mm. (6)

[For prepn. of \bar{C} from isobutyric acid (1:1030) with PCl₅ (81% yield (9)), with PCl₃ (yield: 94% (6), 75% (2)) (8) (4), with PCl₃ + ZnCl₂ (82% yield (9)), with SOCl₂ (yield: 90% (30), 75% (4) (5), 70% (10), 44% (9)), with benzoyl chloride (82-88% yield (13)), or with SiCl₄ in xylene (52% yield (11)) see indic. refs.; for prepn. of \bar{C} from sodium isobutyrate with POCl₃ see (1) (12).]

[\bar{C} with isobutyric acid (1:1030) (14) or \bar{C} with pyridine in ether (15) yields isobutyric anhydride (1:1110), b.p. 182.5°.]

[\bar{C} on passing over Ni at 420° dec. (16) into HCl, CO, CO₂, H₂, CH₄ + propylene; \bar{C} + NH₃ over Al₂O₃ at 490-500° yields (17) isobutyronitrile, b.p. 108°.]

[\bar{C} with Et₃N in dry ether or lgr. at room temp. gives (18) 95% yield triethylamine hydrochloride + 57% yield dimethylketene dimer, cf. also (19) (20).]

[Č with Cl_2 (31) in CCl_4 gives (12) cf. (21) 60-70% α -chloro-isobutyryl chloride (3:5385) + 30-40% β -chloroisobutyryl chloride (3:9101); Č with SO_2Cl_2 in pres. of dibenzoyl peroxide gives (22) 20% α -chloroisobutyryl chloride (3:5385) + 80% β -chloro-isobutyryl

chloride (3:9101). — Č with Br₂ htd. in s.t. 4 hrs. at 100° gives mainly (10) α-bromoisobutyryl bromide, b.p. 163°.]

[C added to large excess of certain RMgX cpds. is in part reduced and in part undergoes ordinary coupling with formn. of ketones; e.g., C with ter-BuMgCl in ether gives (5) (4) (3) 63% ter-butyl-isopropyl-carbinol + 20% isobutyl alc. + 18% 2,2,4-trimethylpentanone-3; C with ter-AmMgCl gives (3) 44% isobutyl isobutyrate.]

[For reactn. of \bar{C} with ethyl sodio-acetoacetate see (6); with ethyl acetoacetate + Mg see (23); with ethyl isobutyrate + triphenylmethylsodium giving 55% yield ethyl $\alpha, \alpha, \gamma, \gamma$ -tetramethylacetoacetate see (24).]

[C with 2-methylbutene-2 (trimethylethylene) + SnCl₄ gives (25) 2-chloro-2,3,5-trimethylhexanone-4, b.p. 74-79° at 14 mm.; C with cyclohexene + SnCl₄ gives (26) 1-cyclohexenyl isopropyl ketone, b.p. 96° at 6 mm.]

[Č with AlCl₃ + C₆H₆ gives (27) isobutyrophenone (isopropyl phenyl ketone) (1:5528); Č with AlCl₃ + toluene gives (28) isopropyl p-tolyl ketone [Beil. VII-331, VII₁-(176)]; Č with AlCl₃ + mesitylene gives (29) 75% yield isopropyl mesityl ketone.]

Č on hydrolysis yields isobutyric acid (1:1030), b.p. 154.7°. — For the amide (30), anilide, p-toluidide, and other derivs. corresp. to Č see isobutyric acid (1:1030).

B.P. 92.9-93.0° at 760 mm. (1)
$$D_4^{20} = 0.8685$$
 (4) $n_D^{20} = 1.4081$ (4) 91.8-91.9° at 753 mm. (2) 0.878 (2) 1.4095 (2) 91° at 753 mm. (3) 45.4° at 150 mm. (1) 25-27° at 60 mm. (4)

Stable at b.p., at 100° for 24 hrs., to aq. at room temp. (2). — \ddot{C} is not present in comml. "mixed amyl chlorides" (1).

[For prepn. of \bar{C} from 2-methylbutene-3 (1:8200) + HCl in dark at room temp. in s.t. for 7 months (88% yield (2)), or + HCl at 100° (5) (6), or at -80° in presence of AlCl₃ (4)

see indicated refs.] [Note that Č cannot be prepd. from the corresp. alc., 2-methylbutanol-3 (1:6170) + HCl since only ter-amyl chloride (3:7220) results (11).]

[For formn. of \tilde{C} from either 2-methylbutene-1 (1:8210) or 2-methylbutene-2 (1:8220) at -80° in presence of AlCl₃ see (7); from isoamyl alcohol (1:6200) + HCl over Al₂O₃ at 430° see (8); from isoamyl chloride (3:7365) over ThCl₄ or BaCl₂ at 250°, finally over pumice at 200°, see (9); from 2-methylbutane (1:8500) + Cl₂ see (10) (1).]

[For study of reactn. of C with Na see (12) (13).]

Č with Mg in dry ether yields (1) (2) corresponding R.Mg.Cl whose treatment with dry O₂ followed by hydrolysis yields (1) (2) 2-methylbutanol-3 (1:6170); [3,5-dinitrobenzoate, cryst. from dil. MeOH (1) or dil. EtOH (2), m.p. 76° (1) (2); N-(α-naphthyl)-carbamate, cryst. from pet. eth., m.p. 111-112° (2) (1).] — This R.Mg.Cl should also react according to method of (11) with phenyl isocyanate to yield isopropyl-methyl-acetanilide, m.p. 78.4° (14), 75° (15), although the execution of this reactn. is not recorded.

 \ddot{C} with excess N/10 AgNO₃ is practically completely hydrolyzed in 60 hrs. (2) [dif. from isoamyl chloride (3:7365) which reacts only to extent of 3-4%].

B.P. 95-97° (1)

The structure of this material is inadequately supported; the prod. may very possibly be identical with 2-chloropentene-2 (3:7285) q.v.

[For prepn. of \bar{C} from 2,2-dichloropentane (3:7755) with alc. KOH see (1).] \bar{C} on further treatment with alc. KOH yields (1) pentyne-1 (1:8025), b.p. 39.7°.

3:7280 (1) Bruylants, Ber. 8, 411 (1875).

3: 7285 2-CHLOROPENTENE-2 Cl
$$C_8H_9Cl$$
 Beil. I — I_1 — I_1 — I_2 — I_3 — I_4 — I_2 — I_2 — I_3 — I_4 — I_4 — I_4 — I_5 —

Two geom, stereoisomers of C are possible but as yet unrecognized.

[For prepn. of \bar{C} from 2,2-dichloropentane (3:7755) with boilg. 10% alc. KOH see (1); from pentanone-2 (1:5415) with PCl₅ see (2).]

C with conc. H₂SO₄ followed by aq. yields (1) methyl-n-propyl ketone (pentanone-2 (1:5415), b.p. 102°.

[C with NaNH2 in xylene at 130° followed by ice water gives (3) pentyne-1 (1:8025).]

C on oxidn. with KMnO₄ yields (1) propionic acid (1:1025) + AcOH (1:1010).

3:7285 (1) Lemke, Tishchenko, J. Gen. Chem. (U.S.S.R.) 7, 1995-1998 (1937); Cent. 1939, I 2398; C.A. 32, 482 (1938). (2) Bourgeul, Ann. chim. (10) 3, 369-370 (1925); Bull. soc. chim. (4) 35, 1633 (1924). (3) Bourgeul, Ann. chim. (10) 3, 220, 370 (1925).

3: 7290 3-CHLORO-2-METHYLBUTADIENE-1,3
$$C_5H_7Cl$$
 Beil. S.N. 12 (2-Chloro-3-methylbutadiene-1,3; Cl CH_3 " β -Chloroisoprene") $H_2C=C-C=CH_2$ B.P. 93° at 760 mm. (1) $D_4^{20}=0.9593$ (1) $n_D^{20}=1.4689$ (1) 41° at 113 mm. (1) (2) 37° at 105 mm. (1)

[For prepr. of \bar{C} (40% yield (1)) from 2-methylbutene-1-yne-3 by treatment as specified (1) with HCl + Cu₂Cl₂ + NH₄Cl see (1) (2) (10); for prepr. (60% yield (3) (4)) from 2,3,3-trichloro-2-methylbutane (3:4755) with quinoline (2 moles) at 140-225° see (3) (4).]

 $\bar{\mathbf{C}}$ readily polymerizes; for details see (1) (2). [For prepn. of plastic polymers from $\bar{\mathbf{C}}$ see (5).]

 \bar{C} htd. in s.t. 16 hrs. at 160° with SO₂ in ord. (not dry) ether yields (6) (7) (10) by 1,4-addition a compd. designated (6) (7) as 1,1-dioxo-3-chloro-4-methylthiacyclopentene-3, ndls. from aq. (7) or alc. (6), m.p. 120.0-120.5° (6) (7). [For extensive study of this prod. see (7).] [The corresponding selenium analog, in very poor (2%) yield from \bar{C} + SeO₂ in CHCl₃ (8), has m.p. 110° dec. (8).]

Č (1 g.) with 1,4-naphthoquinone (1:9040) htd. at 100° for ½ hr. gives (1) on cooling 2-chloro-3-methyltetrahydroanthraquinone, white ndls. from acetone, m.p. 165-166° u.c. (1); this prod. on suspension in dil. alc. NaOH and oxidn. of the blue soln. with air until yel., followed by dilution with aq., gives (1) 2-chloro-3-methylanthraquinone, cryst. from AcOH, m.p. 214-215° u.c. (1), 215° u.c. (9).

3:7295 ETHYL CHLOROFORMATE Cl.CO.OC₂H₅ C₃H₅O₂Cl Beil. III - 10 ("Ethyl chlorocarbonate") III₁-(5) III₂-(10)

B.P.
$$F.P.$$
 -80.6° (1) $D_4^{25} = 1.127$ (10) $D_2^{21.2} = 1.3949$ (8) $D_4^{20} = 1.13519$ (4) $D_4^{20} = 1.13519$ (5) $D_2^{20} = 1.39738$ (4) $D_2^{20} = 1.14419$ (6) $D_2^{20} = 1.14419$ (7) $D_2^{20} = 1.14419$ (8) $D_2^{20} = 1.14419$ (9) $D_2^{20} = 1.144$

Note 1. For D_4^1 between -75.5° (1.278) and $+84.8^{\circ}$ (1.022) see (10).

 $\ddot{\mathbf{C}}$ has strong lachrymatory properties. — [For study of toxicity see (11).] — $\ddot{\mathbf{C}}$ is comml. chemical in U.S.A.

[For prepn. of C from carbonyl chloride (phosgene) (3:5000) with abs. EtOH (1:6130) (90% yield (12)) in pres. of dimethylaniline, quantine, or antipyrine (13) or even Ca(OH)₂ (14) see indic. refs.; for formn. of C from diethyl carbonate (1:3150) with PCl₅ (15), from diethyl pyrocarbonate O(COOEt)₂ (16) with SOCl₂ (17); from pentachloroethyl chloroformate [Beil. III-13, III₁-(6)] (18) or bis-(trichloromethyl) carbonate (triphosgene) (3:1915) (19) or bis-(trichloromethyl) oxalate [Beil. III-17] (20) with EtOH, or from K xanthate, ethyl xanthate, or benzyl xanthate with Cl₂ + aq. in cold (21) see indic. refs.]

Pyrolysis of \bar{C} . \bar{C} on htg. at 250° decomposes yielding (4) EtCl (3:7015) + CO₂ (for study of this reactn. see (22) (23)); in pres. of certain hydrocarbons or esters (24) or in pres. of dimethylaniline (25) temp. of this decomposition is lowered to 150°, in pres. of quinoline to 59° (26) (27), in pres. of AlCl₃ to room temp. (28) (see also below under \bar{C} + pyridine or quinoline).

 \tilde{C} in pres. of anhydrous ZnCl₂ (29) (30) or even metallic Zn (31) decomposes at room temp. yielding (29) (30) EtCl (3:7015) + ethylene + CO₂ + HCl.

Reactions of the $-COOC_2H_5$ group of \bar{C} . \bar{C} on hydrolysis, e.g., by boilg. with aq. or dil. acid (32), yields $CO_2 + HCl + c$ thylene; on alkaline hydrolysis, however, no ethylene is formed (32); note that \bar{C} does not react with cold aq. very rapidly and may even be washed with it to remove alcohol.

[\tilde{C} at its b.p. treated with Cl₂ in sunlight undergoes further substitution by halogen yielding as final prod. (33) (34) pentachloroethyl chloroformate (ref. given above under prepn. of \tilde{C}).]

[\bar{C} with EtHSO₄ at 100° under reflux for 6-8 hrs. gives (40% yield (48)) Et₂SO₄ + EtCl (3:7015).]

Reactions of the chlorine atom of \bar{C} . [\bar{C} on reduction with 3% Na/Hg + aq. gives (51% yield (35)) salt of formic acid (1:1005).]

[C in CHCl₃ with Na₂O₂ does not react until 1-2 drops of aq. are added; vigorous actn. then ensues with forms. of the expected (but very explosive) dicarbethoxy peroxide (EtOOC—O—O—COOEt) (36).]

[\bar{C} with NaSH (37) or with \bar{C}_2H_5 —S—MgBr (38 in ether gives (68% yield (38)) O_2S -diethyl thiocarbonate [Beil. III-133, III₁-(62), III₂-(105)], b.p. 158-159° cor.; \bar{C} (2 moles) + aq. (39) or alc. (40) Na₂S, \bar{C} with BrMgSH in ether (41), or \bar{C} with aq. potassium trithiocarbonate (39), gives diethyl thiodiformate (dicarbethoxy sulfide) [Beil. III-133, III₂-(105)], b.p. 180° dec.]

[C with thallous fluoride 12 hrs. at room temp., then refluxed 2-3 hrs., gives (47% yield (42)) ethyl fluoroformate, lachrymatory oil, b.p. 57° (42).]

[For rate of reactn. of C with KI in acctone at 25° see (43).]

[\bar{C} with aq. alc. KCN at -13° (44) or with solid NaCN (contg. 0.2-7.0% moisture) at not above 90° (45) gives (yields: 90% (45), 46% (44)) ethyl cyanoformate [Beil. II-547, II₁-(238), II₂-(510)], b.p. 115-116° (46), $D_4^{20}=1.0034$ (47), $D_D^{20}=1.3821$ (47).]

 $\tilde{\mathbf{C}}$ as carbethoxylating agent. $\tilde{\mathbf{C}}$ is widely employed as a means of introducing the $-\mathrm{COOEt}$ group into other organic molecules by reactn. of the chlorine atom with the H of the alcoholic, phenolic, or enolic OH groups (or their metallic alcoholates, phenolates, enolates, etc.); under appropriate conditions $\tilde{\mathbf{C}}$ is also employed to introduce the $-\mathrm{COOEt}$ group into an aromatic nucleus. Examples of these reactns, are cited below.

[C with NaOMe yields (49) ethyl methyl carbonate [Beil. III-4, III₂-(4)], b.p. 109° C with NaOEt yields diethyl carbonate (1:3150); other alcohols behave similarly (50). — C with K phenolate or C with phenol in ether + dry K₂CO₃ gives (71% yield (51)) ethyl phenyl carbonate [Beil. VI-157], b.p. 229°; other mono-, di-, and polyhydric phenols behave

similarly. — \bar{C} (1 mole) with salicylic acid (1:0780) in pyridine at -15° (52) or in C_6H_6 with dimethylaniline (63% yield (52)) gives O-carbethoxysalicylic acid [Beil. X-69, X₁-(30)], m.p. 95° (other mono-, di-, and polyhydroxy phenolic acids behave similarly); since the carbethoxy groups so introduced may subsequently be removed by hydrolysis, this process has great value as a means of temporary blocking of phenolic groups (for further discussion and many references see (53)).]

[\bar{C} also reacts with the sodio derivatives and other metallic enolates: e.g., \bar{C} (1 mole) with ethyl cyanoacetate (2 moles) in abs. alc. + NaOEt (2 moles) gives (54) diethyl cyanomalonate [Beil. II-811, II₁-(321), II₂-(680)], b.p. 138-140° at 14 mm., $D_4^{20}=1.1128$, $D_2^{20}=1.4295$ (55). — \bar{C} with diethyl malonate (1:3581) + NaOEt in alc. (56) or \bar{C} with dry diethyl sodio-malonate (57) directly (58) (59) or in C_8H_6 refluxed for 10 hrs. (60) gives (yields: 50-80% (59), 60-65% (60)) triethyl methane-tricarboxylate (tricarbethoxymethane) [Beil. II-810, II₁-(320), II₂-(680)], m.p. 29°, b.p. 253°; note that this same prod. is also obtained (yields: 88-93% (61), 90% (62), 80% (63)) from \bar{C} with diethyl malonate (1:3581) in abs. alc. with Mg + trace CCl₄. — \bar{C} with the Na enolate of ethyl isobutyrate (1:3095) gives (75% yield (64)) diethyl dimethylmalonate [Beil. II-648, II₁-(276), II₂-(572)], b.p. 195-196° at 760 mm. — The reactn. of \bar{C} with ethyl sodioacetoacetate cannot be discussed here.]

[C with excess RMgX compounds presumably gives first the corresp. esters which by further normal reactn. with more RMgX are converted to tertiary alcohols: e.g., C with EtMgBr (excess) yields (65) triethylcarbinol (1:6218); however, the intermediate ester can often readily be obtd.; e.g., C (1 mole) with ter-BuMgCl (1 mole) in dry ether gives (56% yield (66)) ethyl trimethylacetate (ethyl pivalate (1:3117), and other cases are recorded (66); note, however, that with certain types of RMgX cpd. abnormal reactions can occur: e.g., C with benzyl MgCl yields not only the normal tribenzylcarbinol but also (67) ethyl o-toluate (1:3862). — C also reacts with the =N—MgX grouping replacing—MgX by—COOEt (sometimes followed by rearrangement): e.g., C + 3,5-dimethyl-pyrrole-N-(magnesyl bromide) gives (57-58% yield (68)) 5-carbethoxy-2,4-dimethyl-pyrrole.]

Č also reacts readily with NH₃, with primary and secondary amines, with amino acids, etc., to replace one of the H's attached to N by the —COOEt group (see also below and under ♠): e.g., Č with excess conc. aq. NH₄OH immediately (if delayed, urea is formed) evaporated to dryness gives (3) ethyl carbamate (urethane) [Beil. III-22, III₁-(9), III₂-(19)], very eas. sol. aq., cryst. from abs. alc., dry ether, CHCl₃, or C₆H₆, m.p. 48°, b.p. 184°. — [Č (1 mole) in ether with 33% aq. MeNH₂ soln. (1 mole) + aq. NaOH below 5° as directed (69) gives (88–90% yield (69)) (70) (71) ethyl N-methylcarbamate [Beil. IV-64, IV₁-(330), IV₂-(567)], oil, very sol. aq. (69 g. in 100 ml. aq. at 15.5° (72)), b.p.170°. — Countless other, analogous reactns. cannot be cited here.]

[\tilde{C} with hydroxylamine hydrochloride + conc. aq. Na₂CO₃ (73) or with dry K₂CO₃ in ether (74) gives (89.6% yield (74)) N-hydroxyurethane (carbethoxyhydroxamic acid) [Beil. III-95, III₂-(77)], oil, very sol. aq.]

Č with hydrazine hydrate in alc. refluxed ½ hr. (75) (for starting with hydrazine sulfate see (76)) gives (yields: 100% (76), 90% (75)) diethyl sym.-hydrazinedicarboxylate (sym.-dicarbethoxyhydrazine) [Beil. III-98, III₁-(46), III₂-(79)], cryst. from hot aq., ndls. from CHCl₃, m.p. 130° (75), 131° (76) (note that the half reaction product, viz., ethyl hydrazine-monocarboxylate (N-aminourethane) (ethyl carbazinate), is also known (77) (78) but is an oil. — Č (1 mole) with urea (2.1 moles) refluxed for 2-3 hrs. gives (62-65% yield (79)) ethyl allophanate (N-carbethoxyurea) [Beil. III-69, III₁-(31), III₂-(56)], m.p. 192°.

Č (1 mole) in ether with phenylhydrazine (2 moles) in ether (80) (81) (82) (76) or in aq. pyridine (83) gives (yields: 60-65% (80), 60% (76)) ethyl ω-phenylcarbazinate (β-carb-

ethoxy-phenylhydrazine) [Beil. XV-286, XV₁-(71)], cryst. from dil. alc. or C_6H_6 /lgr. as monohydrate, m.p. 85° (81) (82), anhydrous form, m.p. 82-83° (81), 80-82° (76). — \tilde{C} with p-nitrophenylhydrazine in pyridine gives (84) β -carbethoxy-p-nitrophenylhydrazine, cryst. from alc., m.p. 198-199° (84). — \tilde{C} with 2,4-dinitrophenylhydrazine in pyridine gives (84) β -carbethoxy-2,4-dinitrophenylhydrazine, cryst. from aq. alc., m.p. 168-169° (64).

 \tilde{C} (1 mole) with pyridine (1 mole) in the cold gives first a colorless addn. prod. (85) which rapidly turns red (can be used as test for pyridine (85)) and on warming rapidly decomposes with evolution of CO_2 + EtCl (3:7015); \tilde{C} similarly treated with quinoline gives a yellow amorphous solid, considerably more stable than the above pyridine cpd., but at 100° decomposing similarly but more slowly (85) in the same manner (see also above under pyrolysis).

- **©** Ethyl N-(p-tolyl)carbamate (p-tolylurethane): pr. from alc., m.p. 52-53° (21), 52° (88). [From \tilde{C} (1 mole) with p-toluidine (2 moles) in ether (21) (88).]
- N,N'-bis-(Benzyl)urea: ndls. from alc., m.p. 167.5-169° cor. (89). [From C (1 ml.) with benzylamine (3 ml.) + trace NH₄Cl refluxed 1 hr. (89); note that in this reactn. (unlike the two preceding cases) the reagent amine not only reacts with the chlorine atom of C but also ammonolyzes the carbethoxy group; the prod. is therefore a disubstituted urea rather than the ethyl N-benzylcarbamate [Beil. XII-1049], lfts. from lgr., m.p. 48-49° (90), which is formed from C + benzylamine + cold aq. NaOH (90).]
- ---- N-(Carbethoxy)phthalimide: unreported.
- --- N-(Carbethoxy)-3-nitrophthalimide: unreported.
- —— N-(Carbethoxy)-tetrachlorophthalimide: unreported. [Note that C with K tetrachlorophthalimide fails to react under reflux and explodes on htg. in s.t. (92).]
- —— S-(Carbethoxy)isothiourea picrate: m.p. 150-151° (93). [Note that Č (1 mole) with thiourea (1 mole) in conc. aq. soln. on treatment with NaHCO3 in slight excess evolves CO2 and ppts. S-(carbethoxy)isothiourea bicarbonate, bulky white ppt., insol. aq., m.p. 59-60° dec.; this ppt. on immediate treatment with dil. HCl dissolves and from the solution PkOH gives S-(carbethoxy)isothicurea picrate; the same prod. may also be obtd. from the original aq. soln. of Č + thiourea by direct addn. of PkOH (93). Note, however, that the above bicarbonate on stdg. with aq. changes spontaneously to N,N-dicarbethoxythiourea, m.p. 97° dec., + thiourea. Note, however, that Č (1 g.) with thiourea (1 g.) in EtOH (10 ml.) refluxed 30 min., then treated with PkOH (1 g.) does not yield the above prods. but instead (94) S-ethyl-isothiourea picrate, m.p. 187° (94).]

3:7300 d,l-3-CHLORO-2-METHYLBUTENE-1
$$C_5H_9Cl$$
 Beil. I - 211 $(\alpha,\beta$ -Dimethylallyl chloride) Cl CH_3 I_1 -(87) I_2 --

B.P. 93.8° at 760 mm. (1)
$$D_4^{20} = 0.9088$$
 (1) $n_D^{20} = 1.4304$ (1) 18.0-18.1° at 30 mm. (1)

Note: C by virtue of facile allylic transposition is in equilibrium with its synionic isomer, 1-chloro-2-methylbutene-2 (3:7485); reactns. of C may therefore yield also derivatives related to its isomer.

[For prepn. of C (or its mixt, with 1-chloro-2-methylbutene-2) by actn. of Cl₂ as specified (1) on "tertiary amylene" (a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with some 2-methylbutene-1 (1:8210)) see (1). — The relative amt. of \bar{C} and its isomer is not constant but usually is about 60% of C with 40% of 1-chloro-2-methylbutene-2, the ratio, however, being independent of the proportion of the two olefins in the starting material.

[For formn. of C from 2-methylbutene-2 (1:8220) with Cl₂ see (2); from 2-methylbutene-1 (1:8210) see (3); from 2,3-dichloro-2-methylbutane (3.7975) + alc. KOH (3) or by thermal dehydrohalogenation at 420-450° (4) see indic. refs.]

C on hydrolysis gives not only the corresponding alc. but also that corresponding to the isomeric 1-chloro-2-methylbutene-2 (3:7485) together with a little isopropyl methyl ketone. For details see the isomer (3:7485).

 \bar{C} with HCl yields (2) 2,3-dichloro-2-methylbutane (3:7975) + 1,3-dichloro-2-methylbutane (3:9228).

C adds Br₂ giving (3) 1,2-dibromo-3-chloro-2-methylbutane, m.p. 197-198° (3).

C forms many azeotropes: e.g., C with EtOH (1:6130), b.p. 78.3°, gives a const.-boilg. mixt., b.p. 74.8° at 760 mm., contg. 59 wt. % C (8); with n-propyl alc. (1:6150), b.p. 97.2°. a const.-boilg. mixt., b.p. 89.4° at 760 mm., contg. 69 wt. % C (8); with isopropyl alc. (1:6135), b.p. 82.45°, a const.-boilg. mixt., b.p. 79.2° at 760 mm., contg. 57 wt. % C (8) with isobutyl alc. (1:6165), b.p. 107.85°, a const.-boilg. mixt., b.p. 94.5° at 760 mm., contg. 78 wt. % C (8). [For still others see Beil. I₂-(101).]

[For prepn. of C from isoamyl alc. (1.6200) with conc. HCl (5) (9) (10) (11), with conc. HCl + ZnCl₂ (60% yield (12) (13)), with PCl₃ + ZnCl₂ (13) (14), with PCl₅ (15) or PCl₅ + ZnCl₂ (71% yield (13)), with SOCl₂ (70-83% yield (13) (16)) or SOCl₂ + dimethylaniline (100% yield (13)) see indic. refs.]

[For study of hydrolysis by aq. at 80° and 180°, loss of HCl at 180°, and esterification with NaOAc at 180° see (1).]

[For study of rate of reactn. with KI in acetone at 60° see (2); for use in anal. of mixts. of C with 1-chloro-2-methylbutane (3:7345) see (5).

 \bar{C} with Mg in dry ether + trace I₂ gives RMgCl (yield in 5 hrs. 96.3% (26)); this upon oxidation with O₂ yields (17) isoamyl alc. (1:6200) q.v. [Note: for m.p./compn. data for mixts. of N-phenylcarbamates of isoamyl alc. (1:6200) and d,l-sec.-butylcarbinol (1:6195) see orig. ref. (17).]

- © Isocaproanilide: m.p. 112.0° (18) (19); 111.5° (20); 110.5° u.c. (21); 108° cor. (22). [From RMgCl (21) or RMgBr (22) with phenyl isocyanate.]
- **D** Isocapro-p-toluidide: m.p. 63.0° (18); 61.5-62.5° u.c. (21). [From RMgCl + p-tolyl isocyanate (21).]
- ① Isocapro- α -naphthalide: m.p. 110-111° u.c. (21). [From RMgCl + α -naphthyl isocyanate (21).]
- D Isoamyl mercuric chloride (RHgCl): m.p. 86° (23).
- **⑤** S-Isoamylisothiourea picrate: m.p. 173° (24). [In poor yield from Č in alc. on refluxing 2 hrs. with thiourea, followed by addn. of PkOH (24).]
- --- N-(Isoamyl)tetrachlorophthalimide: lfts. from EtOH, m.p. 170-171° (27).

Comml. C may contain unsatd. and P cpds. (14).

[For prepn. of \tilde{C} from *n*-butyric acid (1:1035) with PCl₅ (83% yield (15)), with PCl₃ (yield 69-77% (16)) (9) (17) or PCl₃ + ZnCl₂ (77% yield (15)), with SOCl₂ (yield: 97.4% (18), 90% (19), 85% (10), 80% (6) (7), 50% (15)) (20), with benzoyl chloride (80-87%

yield (8) (21), with phthalyl dichloride (3:6900) (91.5% yield (22)), with benzotrichloride (3:6540) + ZnCl₂ at 70-80° (23), or with SiCl₄ in xylene (49% yield (24)) see indic. refs.; for prepn. of \tilde{C} from α -chloroethyl n-butyrate on warming with a trace of ZnCl₂ see (25); for prepn. of \tilde{C} from n-butyric acid (1:1035) by use of methyl chlorosulfonate, benzene-sulfonyl chloride, etc., see (26).]

[\bar{C} on htg. with *n*-butyric acid (9) or with sodium *n*-butyrate yields *n*-butyric anhydride (1:1126), b.p. 198.2° at 760 mm. (12), f.p. -75.0° (12), $D_4^{21} = 0.9687$ (27), $n_D^{19.73} = 1.4124$ (28).]

 \tilde{C} with Cl_2 in CCl_4 gives (17) a mixt. of α -, β - and γ -chloro-n-butyryl chlorides, some α -chloro-n-butyric acid anhydride also being formed (29); \tilde{C} with SO_2Cl_2 in pres. of dibenzoyl peroxide gives (30) 15% α -chloro-n-butyryl chloride (3:5570), 55% β -chloro-n-butyryl chloride (3:5970). — For study of mech. of chlorination see (31). — [For action of PCl_5 on \tilde{C} see (32).]

[\tilde{C} with Br₂ in light yields (17) (33) (14) (34) α -bromo-*n*-butyryl chloride, b.p. 151-153° (34), and β -bromo-*n*-butyryl chloride.]

[\tilde{C} on cat. hydrogenation with H_2 + Pd-BaSO₄ cat. in ether (35) or in vapor phase (36) gives n-butyraldehyde (1:0130), b.p. 74.7°; \tilde{C} on reduction with Na/Hg or Na in moist ether yields (37) (38) (39) octene-4-diol-4,5 di-n-butyrate.]

[C̄ added to large excess of certain RMgX cpds. in ether is in part reduced and in part undergoes normal form. of corresp. ketone: e.g., C̄ with ter-BuMgCl gives 9% reduction and 71% ketone form. (6) (7) (11); products include n-butyl n-butyrate, ter-butyl n-propyl ketone (2,2-dimethylhexanone-3), and ter-butyl-n-propyl-carbinyl n-butyrate. — C̄ with excess C₆H₆MgBr gives (84% yield (40)) 1,1-diphenylbutene-1 [Beil. V-648, V₁-(313)].]

[C with chlorosulfonic acid at room temp. {41} or with AlCl₃ in CHCl₃ followed by aq. (42) gives di-n-propyl ketone (butyrone) (1:5447), b.p. 144°. — Note, however, that C on htg. with AlCl₃ at 60° without CHCl₃, then poured into aq., yields (42) (43) 2,4,6-triethylphloroglucinol [Beil. VI-1129], m.p. 107°.]

[$\bar{\rm C}$ with ethylene + AlCl₃ at 20° gives (70% yield (44)) (45) β -chloroethyl n-propyl ketone (1-chlorohexanone-3) [Beil. 1-690]; $\bar{\rm C}$ with cyclohexene + SnCl₄ yields (46) 1-cyclohexenyl n-propyl ketone, b.p. 100–102° at 8 mm., $D_4^{14} = 0.950$, $n_D^{14} = 1.4885$ (oxime, m.p. 67°, semicarbazone, m.p. 175°) (46); $\bar{\rm C}$ with cyclohexane + AlCl₃ yields (47) α -methyl-cyclopentyl n-propyl ketone.]

[\bar{C} with C_6H_6 + AlCl₃ gives (89% yield (48)) (16) phenyl *n*-propyl ketone (butyrophenone) (1:5535), b.p. 230°; \bar{C} with toluene + AlCl₃ gives (49) *n*-propyl *p*-tolyl ketone Beil. VII-330, VII₁-(175)], b.p. 250°.]

[\bar{C} with AlCl₃ + phenol yields (50) (51) (20) 45% o-(n-butyryl)phenol, b.p. 124-126° at 14 mm. (51), 119° at 9 mm. (50), m.p. 10.5-10.6° (50), 8° (51), D_{-}^{24} = 1.0683 (50), $n_{D}^{25.5}$ = 1.5375 (50) (semicarbazone, m.p. 192-193° (50), phenylhydrazone, m.p. 85-87° (51)), and 30% p-(n-butyryl)phenol, b.p. 200° at 15 mm. (51), 187-189° at 9 mm. (50), m.p. 91-91.5° (50) (benzoate, m.p. 107-107.5° (50), 106-107° (51)); for reactn. of \bar{C} with carvacrol (1:1760) + AlCl₃ in nitrobenzene see (52), similarly with thymol (1:1430) see (53).]

 \bar{C} on hydrolysis yields *n*-butyric acid (1:1035), b.p. 164°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to \bar{C} see *n*-butyric acid (1:1035).

3: 7390 1-CHLORO-3-METHYLBUTADIENE-1,2
$$C_5H_7Cl$$
 Beil. S.N. 12 (4-Chloro-2-methylbutadiene-2,3) CH_3 Cl CH_3 CH_4 CH_5 $CH_$

B.P. 102-103° (1)
$$D_4^{20} = 0.9515$$
 (1) (2) $n_\alpha^{20} = 1.46697$ (2) $101-104^\circ$ (2)

[For prepn. of \bar{C} from 2-methylbutyne-3-ol-2 (dimethyl-ethynyl-carbinol) on shaking as specified (1) (2) with HCl + CuCl₂ + NH₄Cl; the initial reactn. prod. is 2-chloro-2-methylbutyne-3 (3:7155) which may be obtd. in 63% yield if reactn. time is short (1) (2); on stdg. with the reactn. mixt. for 18 days, however, this is isomerized to \bar{C} (40-65% yield (2)) cf. (4).]

Č on stdg. several days with HCl/Cu₂Cl₂/NH₄Cl mixt. is isomerized (2) to 1-chloro-3-methylbutadiene-1,3 (3:7355) q.v.

 \tilde{C} on htg. with aq. + CaCO₃ yields (1) (3) not only its precursors, 2-chloro-2-methylbutyne-3 (3:7155) and 2-methylbutyne-3-ol-2, but also vinyl chloride (3:7010), methylacetylene, and 4-chloro-2-methylbutadiene-1,3 (3:7355) q.v.

 \tilde{C} gives no ppt. with NH₄OH/AgNO₈ (1). [Dif. from 2-chloro-2-methylbutyne-3 (3:7155).]

C on oxidn. with KMnO₄ yields (1) α -hydroxyisobutyric acid (1:0431).

3:7300 (1) Favorskii, Favorskaya, Compt. rend. 200, 839-840 (1935); Cent. 1935, II 1340; C.A. 29, 3651 (1935). (2) Favorskaya, J. Gen. Chem. (U.S.S.R.) 9, 386-395 (1939); C.A. 33, 9281

3: 7395 trans-2,3-DICHLOROBUTENE-2 Cl
$$C_4H_6Cl_2$$
 Beil. S.N. 11 CH_3 — C — C — CH_3 Cl B.P. 101–103° at 758 mm. (1) $D_4^{20} = 1.1416$ (1)

[See also cis stereoisomer (3:5500).]

[For prepn. of \bar{C} (accompanied by its cis stereoisomer (3:5500)) from 2,2,3-trichloro-butane (3:5680) with solid KOH (1 mole) at 135-140° see (1).]

C on oxidn. with 3% aq. KMnO4 yields (1) acetic acid (1:1010).

 \bar{C} in CCl₄ at -20° treated with 7% O₃, then hydrolyzed, yields (1) acetic acid (1:1010) + acetaldehyde (1:0100).

3:7395 (1) Tishchenko, Churbakov, J. Gen. Chem. (U.S.S.R.) 6, 1553-1558 (1936); Cent. 1937, I 3785; C.A. 31, 2165 (1937).

3: 7400 d,I-4-CHLOROPENTENE-2 Cl
$$C_5H_9Cl$$
 Beil. I - 210 (2-Chloropentene-3; α, γ -dimethylallyl chloride, α -methylcrotyl chloride, piperylene hydrochloride)

B.P.
$$103^{\circ}$$
 dec. at 760 mm. (1) $n_{\rm D}^{25}=1.4311$ (5) $103-106^{\circ}$ (2) 100.5° at 771.6 mm. (3) $D_4^{20}=0.9004$ (3) (10) $n_{\rm D}^{20}=1.4322$ (3) 68° at 200 mm. (4) 1.4328 (10) 65° at 200 mm. (3) 57° at 200 mm. (10) 58° at 155 mm. (5) $18-20^{\circ}$ at 12-13 mm. (1)

Two geom. stereoisomers of \tilde{C} are possible but as yet unrecognized. — [A levorotatory form of \tilde{C} has been obtd. (6) (7) cf. (11). — \tilde{C} does not undergo allylic transposition.]

[For prepn. of C from penten-2-ol-4 with HCl gas in the cold (3) (5), with PCl₃ in dry ether (37% yield (8)) or with pyridine (4), with PCl₅ (2) see indic. refs.]

C is readily hydrolyzed even by cold aq. (3); with KOH gives Sap. Eq. 106.2 (calcd. 104.6) (4). [For study of mech. of hydrolysis of C see (4).]

 $[\bar{C}$ with HBr gives (3) 4-bromopentene-2; with phenol as specified (8) gives phenyl α, γ -dimethylallyl ether, with diethyl sodiomalonate gives the substituted ester (5); for reactn. of \bar{C} with various aliphatic and aromatic amines see (9).]

[Č with *n*-propyl MgCl yields (10) 4-methylheptene-2, b.p. 113.5° at 760 mm., $D_4^{20} = 0.7206$, $n_D^{20} = 1.4123$ (10).]

- $d-(\alpha,\gamma-\text{Dimethylallyl})$ acetate: b.p. 136-137° (11). [From the corresp. d-alcohol with Ac₂O + pyridine (11).]
- $d_{i}l^{2}-(\alpha,\gamma$ -Dimethylallyl) benzoate: b.p. 140° at 21 mm.; $n_{D}^{23}=1.5075$ (11). [From the corresp. d-alcohol with BzCl + pyridine (11).]

- $d_{s}l_{-}(\alpha, \gamma-\text{Dimethylallyl})$ p-nitrobenzoate: m.p. 56° (11). [From the d- or $d_{s}l_{-}$ forms of corresp. alcohol (11).]
- d_i -(α, γ -Dimethylallyl) N-(α -naphthyl)carbamate: m.p. 105° (11). [For important details regarding this see (11).]

(2) 45, 497-498 (1881).

3:7430 1,2-DICHLORO-2-METHYLPROPANE CH₃ C₄H₈Cl₂ Beil. I - 126 (Isobutylene dichloride)
$$CH_3$$
— C — CH_2 I_{1-} (88)

B.P.
$$106.5^{\circ}$$
 cor. at 760 mm. (1) $D_4^{20} = 1.089$ (4) $n_D^{20} = 1.4370$ (1) $107-108^{\circ}$ (3) (4) (5) (6) (7) 1.4360 (4) $59-60^{\circ}$ at 150 mm. (1) $D_{20}^{20} = 1.093$ (1) $n_D^{17} = 1.4373$ (3) $38.6-39.2^{\circ}$ at 70 mm. (1)

Liq. with mild clean sweetish odor; stable on stdg. and develops no HCl even in 6 months (1).

[For prepn. from *ter*-butyl chloride (3:7045) by chlorination see (1) (2) (8); from 2-methylpropene (isobutylene) by addn. of Cl_2 at 0° see (4); from 1-chloro-2-methylpropanol-2 (3:7752) with conc. HCl see (2) (9); from isobutane by chlorination see (10).]

Upon hydrolysis the tertiary chlorine atom shows great reactivity, the primary chlorine atom little. Thus $\bar{\mathbb{C}}$ on boiling with aq. for 18 hrs. gives (48% yield (2)) 1-chloro-2-methylpropanol-2 (3:7752). [The addn. of bases (NaOH or NaHCO₃) or antiacids (CaCO₃) results in lower yields (2).] [In addn. to the above 1-chloro-2-methylpropanol-2 the presence of NaHCO₃ or Na₂CO₃ leads (11) to formn. of 2-methylpropanediol-1,2 (isobutylene glycol) [Beil. I-480], 1-chloro-2-methylpropene-1 ("isocrotyl chloride") (3:7120), and isobutyraldehyde (1:0120).] [For study of methods of conversion of $\bar{\mathbb{C}}$ to isobutyraldehyde see (1).]

(31) Allen, Nicholls, J. Am. Chem. Soc. 56, 1409-1410 (1934).

[For prepn. of \bar{C} from β -ethoxyethyl alc. ("Cellosolve") (1:6410) with PCl₃ (7) (8) or with SOCl₂ + pyridine (20% yield (10)) (11) in CHCl₃ (58.3% yield (9)) see indic. refs.; from ethylene chlorohydrin (3:5552) + ethyl alc. (1:6130) + conc. H₂SO₄ at 145° see (1); from ethylene with ethyl hypochlorite (3:7022) (12) or with mixtures yielding the latter, such as EtOH + Cl₂ (85% yield \bar{C} (2)) or alc. N,N-dichlorobenzenesulfonamide (5), see indic. refs.; from β -iodoethyl ethyl ether with Cl₂, SbCl₅, or ICl see (3).]

 \bar{C} with NaI in acctone refluxed 15 hrs. gives (10) (11) β -ethoxyethyl iodide, b.p. 151-154° (10) (11).

[$\bar{\rm C}$ with KSH in s.t. at 65° for 24 hrs. (1) cf. (13) gives (74% yield (1)) β -ethoxyethyl mercaptan, b.p. 125.5–125.8° u.c., $D_{20}^{20}=0.9479$ (1) (corresp. EtOCH₂CH₂SHgCl, m.p. 152.0–153.5° dec. (1)) accompanied by (13% yield (1)) of bis-(β -ethoxyethyl) sulfide, b.p. 229° cor., also obtd. (51% yield (1)) from $\bar{\rm C}$ + alc. Na₂S.]

[\bar{C} with excess NaOC₆H₅ in alc. htd. 10 days gives (1) β -phenoxyethyl ethyl ether (β -ethoxyphenetole), b.p. 230°. — \bar{C} with disodium salt of hydroquinone (1:1590) gives (14) hydroquinone bis-(β -ethoxyethyl ether), m.p. 34-35°, b.p. 210-212° at 25 mm. (14).]

[Č with diethyl malonate + alc. NaOEt gives (14% yield (1)) cf. (15) diethyl β -ethoxy-ethylmalonate, b.p. 134–138° at 15 mm. (1), 118–119° at 6 mm. (15); $D_{\perp}^{20} = 1.0199$ (15).]

[\bar{C} with aniline refluxed 2 hrs. gives (1) N-(β -ethoxyethyl)aniline, b.p. 262-263° cor.] [For reactn. of \bar{C} + NaNH₂ with α -picoline, with γ -picoline, and with β -collidine see (16).]

3:7464
$$\beta$$
-CHLOROETHYL VINYL ETHER C₄H₇OCl Beil. I — CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—CH₂—(473) B.P. 109° cor. at 740 mm. (1) $D_{15}^{15} = 1.0525$ (1)

[For prepn. of \tilde{C} from β,β' -dichlorodiethyl ether (3:6025) with solid N2OH at 200° (1) or with triethanolamine + solid NaOH (70% yield (2)) see indic. refs.]

 $\ddot{\mathbf{C}}$ is stable toward alkalies but with dil. acids even in cold is readily and quant. hydrolyzed (1) to β -chloroethanol (3:5552) and acetaldehyde (1:0100).

[\bar{C} with diethyl sodiomalonate gives (73% yield (1)) diethyl β -(vinyloxy)ethyl malonate, b.p. 130-135° at 9 mm., $D_{15}^{16} = 1.0575$ (1); this prod. condenses (1) with urea to give 5-(β -(vinyloxy)ethyl)barbituric acid (whose properties appear to be subsequently unreported) which itself with dil. minl. acid hydrolyzes to give 5-(β -hydroxyethyl)barbituric acid, m.p. above 300° (3). — For analogous reactions of \bar{C} with various diethyl alkylmalonates and reaction of the products with urea to give the corresp. 5-alkyl-5-(β -(vinyloxy)ethyl)barbituric acids see (3). — \bar{C} with diethyl phenyl-sodio-malonate in s.t. at 140-145° for 14 hrs. gives (52% yield (4)) diethyl 5-phenyl-5-(β -(vinyloxy)ethylmalonate, b.p. 196-197° at 17 mm., $D_4^{20} = 1.098$; this prod. with urea gives (4), 5-phenyl-5-(β -(vinyloxy)ethyl)barbituric acid which upon hydrolysis with dil. acid gives (10% yield (4)) 5-phenyl-5-(β -hydroxyethyl)barbituric acid ("hydroxyluminal").]

[\bar{C} with phenylacetonitrile gives (50% yield (4)) phenyl-(β -vinyloxyethyl)acetonitrile, b.p. 147° at 8 mm., $D_4^{20} = 1.029$ (4).]

[For use of C in prepn. of cellulose ethers see (5).]

3:7464 (1) Cretcher, Koch, Pittenger, J. Am. Chem. Soc. 47, 1175-1176 (1925). (2) Chitwood, Perkins (to Carbide and Carbon Chem. Corp.), U.S. 2,104,717, Jan. 4, 1938; Cent. 1938, I 4236; [C.A. 32, 1712 (1938)]: French 815,148, July 6, 1937; Cent. 1937, II 4238; C.A. 32, 1278 (1938). (3) Cretcher, Koch, Pittenger, J. Am. Chem. 3: 7465 4-CHLORO-2-METHYLBUTENE-2
$$C_5H_9Cl$$
 Beil. I - 214 $(\gamma,\gamma$ -Dimethylallyl chloride; Cl CH_3 I_1 -(88) isoprene hydrochloride) CH_2 -CH=C-CH₃ I_2 -(191)

B.P.
$$109^{\circ}$$
 (1) $D_{4}^{20} = 0.9335$ (1) $n_{D}^{20} = 1.43975$ (4) $30-33^{\circ}$ at 40 mm. (4)

Colorless liq. with odor like allyl chloride. — $\bar{\mathbf{C}}$ darkens on stdg. and loses HCl on distn. (1).

[For prepn. of C from 2-methylbutadiene-1,3 (isoprene) (1:8020) by 1,4-addn. of dry HCl gas see (1) (4).]

 \overline{C} on htg. in s.t. with KOAc + AcOH (1) or passed over TiO_2 at 425–450° at reduced press. (3) loses HCl yielding isoprene (1:8020), b.p. 34°.

Č reduces alk. KMnO₄ (1).

Č in conc. HCl satd. with HCl gas gives (94% yield (1)) 2,4-dichloro-2-methylbutane (3:8105), b.p. 145-146° (1) cf. (4).

C in CHCl₃ adds 1 Br₂, yields (1) 2,3-dibromo-4-chloro-2-methylbutane, oil decomposing on distn. even under reduced press. (1).

[For behavior of C with AlCl₃ see (2).]

3:7465 (1) Aschan, Ber. 51, 1303-1307 (1918). (2) Thomas, Carmody, J. Am. Chem. Soc. 55, 3855 (1933). (3) Müller-Cunradi (to I.G.), Ger. 565,160, Nov. 26, 1932. (4) Soday (to United Gas Improvement Co.), U.S. 2,376,396, May 22, 1945; C.A. 39, 3548 (1945).

3: 7470 1-CHLOROPENTENE-2
$$C_5H_9Cl$$
 Beil. I — $(\gamma$ -Ethylallyl chloride) CH₃.CH₂.CH=CH.CH₂Cl I₁— I₂-(184) B.P. 109–110° (1) (2) $D_-^{23} = 0.9095$ (3) $n_D^{23} = 1.4347$ (3)

Note. Č by virtue of facile allylic transposition is readily converted to an equilibrium mixt. with its synionic isomer 3-chloropentene-1 (3:7260) q.v.; reactns. of Č may therefore frequently yield also the corresponding derivatives of the isomer.

[For prepn. of \bar{C} (or its mixt. with 3-chloropentene-1 (3:7260)) from penten-2-ol-1 with dry HCl gas at 0° (5) (7), with PCl₃ + pyridine (4) (7), or with SOCl₂ in ether (6) see indic. refs.; for prepn. of \bar{C} from 3-chloropentene-1 (3:7260) by htg. at 225° (60-62% \bar{C}) see (6) (3).] [\bar{C} is separable from the accompanying isomer by careful fractional distn. (7) (5).] [For formn. of \bar{C} (together with other products) from pentene-2 (1:8215) + Cl₂ in CCl₄ see (8).]

 \bar{C} on long shaking with aq. Na₂CO₃ gives (7) in poor yield penten-2-ol-1 (*p*-nitrobenzoate, m.p. 53°) accompanied by much penten-1-ol-3. — \bar{C} on htg. with alc. KOH gives (3) (7) in poor yield the corresp. ethyl ether, viz., 1-ethoxypentene-2, b.p. 123°, $D_{-}^{23} = 0.7930$, $n_{D}^{23} = 1.4099$ (3), accompanied by the isomeric 3-ethoxypentene-1, b.p. 102°, $D_{-}^{23} = 0.7768$, $n_{D}^{23} = 1.3986$ (3).

[For study of reactns. of \bar{C} with KOAc in AcOH, with AgOAc, with N-methylaniline, with diethylamine, etc., see (7); for reactn. of \bar{C} with phenol in pres. of K_2CO_3 + acetone see (5).]

 \bigcirc N-(Penten-2-yl-1)phthalimide [N-(γ-ethylallyl)phthalimide]: colorless rhombic cryst. from alc., m.p. 69-70° (7). [From \bigcirc on htg. with K phthalimide in a s.t. at 190-200° for 2½ hrs.; note that some of the corresp. deriv. from the isomer, viz., N-(α-ethylallyl)phthalimide, m.p. 78-79°, is formed to extent of about 10% (7).]

3:7470 (1) Mumm, Richter, Ber. 73, 858-860 (1940). (2) Mumm, Hornhardt, Diederichsen, Ber. 72, 107 (1939). (3) Prevost, Compt. rend. 187, 1053-1054 (1928). (4) Gredy, Bull. soc. chim. (5) 4, 419 (1937). (5) Lauer, Filbert, J. Am. Chem. Soc. 58, 1388 (1936). (6) Prevost, Bull. soc. chim. (4) 49, 264-267 (1931). (7) Meisenheimer, Link, Ann. 479, 254-277 (1930). (8) Stewart, Weidenbaum, J. Am. Chem. Soc. 58, 98-100 (1936).

3:7475 3-CHLORO-2,2-DIMETHYLBUTANE
$$C_6H_{13}Cl$$
 Beil. S.N. 10 (Pinacolyl chloride; CH_3 H ter-butyl-methyl-carbinyl chloride) CH_3 CH_4 CH_5 CH_5

B.P. 109.9° at 734 mm. (1) $D_4^{20} = 0.8767$ (1) $n_D^{20} = 1.4181$ (1) [For form. of \tilde{C} (11%) from 2,2-dimethylbutane (neohexane) (1:8510) on chlorination

see (1).] [Note that the corresp. alc. (pinacolyl alc.) (1:6186) with HCl does not give C but rather rearr. prods. (2).]

Č with Mg in dry ether gives RMgCl which with oxygen yields (1) pinacolyl alc. (1:6186) q.v.

Pinacolyl mercuric chloride (C₆H₁₃HgCl): cryst. from dil. alc., m.p. 89-90° (3); 89.5-90° (2). [From RMgCl + HgCl₂ in ether.] 3:7475 (1) Whitmore, Bernstein, Mixon, J. Am. Chem. Soc. 60, 2539 (1938). (2) Whitmore, Rothrock, J. Am. Chem. Soc. 55, 1106-1109 (1933). (3) Whitmore, Bernstein, J. Am. Chem. Soc. 60, 2627 (1938).

3: 7480 3,3-DICHLORO-2-METHYLPROPENE-1
$$C_4H_6Cl_2$$
 Beil. S.N. 11 (1,1-Dichloro-2-methylpropene-2) Cl CH_3 HC — C = CH_2 Cl

B.P.
$$108-112^{\circ}$$
 at 762 mm. (1) $D_4^{24} = 1.1363$ (1) $n_C^{24} = 1.4523$ (1) $49-50^{\circ}$ at 120 mm. (1)

Note. \bar{C} by virtue of allylic transposition may yield derivatives of its synionic isomer 1,3-dichloro-2-methylpropene-1 (3:5590) q.v.

[For prepn. of \tilde{C} (68% yield together with 32% yield of 1,1,2-trichloro-2-methylpropane (3:5710)) from 1-chloro-2-methylpropene-1 (β,β -dimethylvinyl chloride) (3:7120) with Cl₂ (1 mole) + NaHCO₃ (1.5 moles) at 0° see (1).]

Č on htg. under reflux gives (by allylic transposition) 1,3-dichloro-2-methylpropene-1 (3:5590), b.p. 132°.

Č with O₃ followed by hydrolysis yields (1) α,α -dichloroacetone (3:5430) + methylglyoxal (propanone-2-al-1) [Beil. I-762; I₁-(395), I₂-(819)].

3:7480 (1) Tishchenko, J. Gen. Chem. (U.S.S.R.) **8,** 1232-1246 (1938); Cent. **1939,** II 4223; C.A. **33,** 4190 (1939).

3: 7485 1-CHLORO-2-METHYLBUTENE-2 CH₃
$$C_5H_9Cl$$
 Beil. I — $(\beta,\gamma$ -Dimethylallyl chloride) CH₃—CH=C — CH₂Cl I_1 — I_2 —(189) B.P. 110° at 760 mm. (1) $D_4^{20} = 0.9327$ (1) $n_D^{20} = 1.4481$ (1) 25.9-26.4° at 25 mm. (1) $D_4^{16} = 0.9324$ (2)

Note. \tilde{C} by virtue of facile allylic transposition is in equilibrium with its synionic isomer 3-chloro-2-methylbutene-1 (3:7300); reactns. of \tilde{C} therefore may also yield derivatives related to its isomer.

[For prepn. of \bar{C} (or its mixt. with the synionic 3-chloro-2-methylbutene-1 (3:7300)) by actn. of Cl_2 as specified (1) on "tertiary amylene" (a mixt. consisting mainly of 2-methylbutene-2 (1:8220) with some 2-methylbutene-1 (1:8210)) see (1). — The relative amt. of \bar{C} and its isomer is not constant but usually is about 40% of \bar{C} with 60% of 3-chloro-2-methylbutene-1 (3:7300), the ratio, however, being independent of the proportion of the two olefins in the starting material.]

[For formn. of \bar{C} from 2-methylbutene-2 (1:8220) with Cl_2 see (2); from 2-methylbutene-1 (1:8210) see (3); for prepn. of \bar{C} (together with other prods.) from 1-chloro-2-methylbutanol-2 (3:8175) by distn. with anhyd. oxalic acid (4) or with Ac_2O + conc. H_2SO_4 (5) see (4) (5); for prepn. of \bar{C} from 2-methylbuten-2-ol-1 with PCl_3 + pyridine see (1).]

 $\ddot{\mathbf{C}}$ on hydrolysis gives not only the alc. corresponding to $\ddot{\mathbf{C}}$ but also that corresp. to the isomeric 3-chloro-2-methylbutene-1 (3:7300) together with a little ketone: thus $\ddot{\mathbf{C}}$ on hydrolysis with 12 pts. aq. at 70° for 16 hrs. gives (6) 25% alc. A (2-methylbuten-1-ol-3) [N-(α -naphthyl)carbamate, m.p. 91.5-93° (6)] + 50% alc. B (2-methylbuten-2-ol-1) [N-(α -naphthyl)carbamate, m.p. 103-103.5° (6)] + 5% isopropyl methyl ketone (1:5410);

 \bar{C} on hydrolysis with 2 pts. aq. + 1 mole CaCO₃ for 4 hrs. at 70° gives (6) 60% alc. A + 30% alc. B + 5% isopropyl methyl ketone (1:5410); \bar{C} on hydrolysis with CaO for 1½ hrs. gives (6) 70% alc. A + 25% alc. B + a trace of ketone.

[For study of reactn. of C with NaI (4) and its rate of reactn. with KI in acetone at 20° (7) or with NaOEt in alc. at 35° (7) see indic. refs.; the reactivity of the halogenation of C is greater than that in crotyl chloride (1-chlorobutene-2) (3:7205) and the latter in turn is more reactive than that in methallyl chloride (3-chloro-2-methylpropene-1) (3:7145) or allyl chloride (3:7035), which are about the same (4),

 \bar{C} on treatment with O₃ followed by hydrolysis yields (3) (2) chloroacetone (3:7212) + acetaldehyde (1:0100).

3:7485 (1) Burgin, Engs, Groll, Hearne, Ind. Eng. Chem. 31, 1416 (1939). (2) Tishchenko, J. Gen. Chem. (U.S.S.R.) 6, 1116-1132 (1936); Cent. 1937, I 572; C.A. 31, 1003 (1937). (3) Gutner, Tishchenko, J. Gen. Chem. (U.S.S.R.) 8, 1062-1067 (1938); Cent. 1939, II 4221; C.A. 33, 3755 (1939). (4) Chalmers, Trans. Roy Soc Can. (3) 22, III 74-77 (1928). (5) Seyer, Chalmers, Trans. Roy. Soc. Can. (3) 20, III 338 (1926). (6) Tishchenko, J. Gen. Chem. (U.S.S.R.) 6, 1549-1552 (1936); Cent. 1937, I 3785, C.A. 31, 2165 (1937). (7) Tamele, Ott, Marple, Hearne, Ind. Eng. Chem. 33, 118-119 (1941).

Note that the prod. of b.p. 180°, formerly (3) supposed to have been C, is in fact (2) diallyl carbonate.

[For prepn. of \bar{C} from allyl alc. (1:6145) with phosgene (3:5000) (yield 37% (1)) (4) (2) see indic. refs.; note that some diallyl carbonate, b.p. 166° at 730 mm. (2), is also formed (2).]

 \overline{C} in quinoline begins to decompose at 37° (5) (6) presumably into CO_2 + allyl chloride (3:7035) although this is not specifically stated.

[For reaction of \bar{C} with diethylene glycol (1:6525), triethylene glycol (1:6538), etc., see (7).]

3: 7495 d,l-4-CHLORO-2-METHYLPENTANE
$$C_6H_{13}Cl$$
 Beil. I — $(d,l$ -Isobutyl-methyl-carbinyl CH_3 H I_1 — chloride) CH_2 — C — CH_2 — C — CH_3 H I_2 -(111)

B.P. 111-112° at 773 mm. (1)
$$D_4^{20} = 0.861$$
 (1) $n_D^{20} = 1.4113$ (1)

[For prepn. of \bar{C} from 2-methylpentanol-4 (1:6199) with dry HCl for 18 weeks (82% yield) see (1); for formn. of \bar{C} (together with other products) in reaction of 2-ethylbutanol-1 (1:6223) with HCl + ZnCl₂ see (2).]

 \ddot{C} with Mg in dry ether yields RMgCl which with O₂ gives (62% yield (1)) 2-methylpentanol-4 (1:6199) [N-(α -naphthyl)carbamate, m.p. 93.5-94.5° (2)]; this alc. upon oxidn. with CrO₃/H₂SO₄ yields (2) 4-methylpentanone-2 (1:5430) q.v.

3:7495 (1) Whitmore, Johnston, J. Am. Chem. Soc. 60, 2267 (1938). (2) Whitmore, Karnatz, J. Am. Chem. Soc. 60, 2535 (1938).

CHAPTER XVII

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 2. D_4^{20} less than 1.1500

(3:7500-3:7999)

B.P. 109-114° sl. dec. (1)

[For prepn. of \ddot{C} from 2-methylpenten-4-ol-2 (allyl-dimethyl-carbinol) [Beil. I-445, I₂-(487)] with PCl₅ see (1).]

3:7500 (1) M. Saytzeff, A. Saytzeff, Ann. 185, 156 (1877).

3: 7520 1-CHLORO-2,3-DIMETHYLBUTENE-2
$$C_6H_{11}Cl$$
 Beil. S.N. 11 $(\beta,\gamma,\gamma$ -Trimethylallyl chloride) CH_3 CH_3

B.P. 111-112° at 756 mm. (1)
$$D_4^{19} = 0.8895$$
 (1) $n_C^{19} = 1.4315$ (1)

Note. \bar{C} by virtue of allylic transposition would be expected to be in equilibrium with its synionic isomer 3-chloro-2,3-dimethylbutene-1(α,α,β -trimethylallyl chloride). The material described by (1) was regarded as \bar{C} ; the isomer seems to be unrecorded.

[For prepn. of \tilde{C} (or its mixt. with 3-chloro-2,3-dimethylbutene-1) in 90% yield from 2,3-dimethylbutene-2 (tetramethylethylene) (1:8290) with Cl₂ + NaHCO₃ at 0° see (1).]

 $\ddot{\mathbf{C}}$ on hydrolysis yields (1) a hexenol (regarded (1) as 2,3-dimethylbuten-1-ol-3 derived from the synionic isomer of $\ddot{\mathbf{C}}$), b.p. 116-118°, $D_4^{17}=0.835$, $n_{\ddot{\mathbf{C}}}^{17}=1.4248$ (1).

3:7520 (1) Tishchenko, J. Gen. Chem. (U.S.S.R.) 8, 1232-1246 (1938); Cent. 1939, II 4222; C.A. 33, 4190 (1939).

3: 7525
$$\alpha$$
-CHLOROETHYL n -PROPYL ETHER $C_5H_{11}OCl$ Beil. I - 607 H_1 I_1 — I_2 — CH_3 . C.O. n -C $_3H_7$ Cl Cl B.P. 112–115° at 731 mm. (1) $D_4^{20} = 0.9322$ (2) $n_D^{20} = 1.4013$ (2)

47.5° cor. at 40 mm. (2)

C decomposes considerably if distd. at ord. press. (3).

[For prepn. (93% yield (2)) from paraldehyde (1:0170) + n-propyl alc. (1:6150) + dry HCl see (2) (3).]

C on stdg. polymerizes to dark tarry residue (2).

 $|\tilde{C}|$ on bromination yields α,β -dibromoethyl n-propyl ether (3).

 \overline{C} on shaking with aq. yields acetaldehyde (1:0100), n-propyl alc. (1:6150) + HCl.

3:7525 (1) Gauthier, Ann. chim. (8) 16, 312 (1909). (2) Henze, Murchison, J. Am. Chem. Soc. 53, 4077-4079 (1931). (3) Dykstra, Lewis, Boord, J. Am. Chem. Soc. 52, 3399-3400 (1930).

3:7530 2-CHLOROHEXENE-1 Cl
$$C_6H_{11}Cl$$
 Beil. S.N. 11 $CH_3.CH_2.CH_2.CH_2-CH_2$

B.P.

113° at 740 mm. (1)
$$D_4^{25} = 0.8886$$
 (1) $n_D^{25} = 1.4278$ (1) $109.5-110.5$ ° at 735 mm. (2) 0.8872 (2) 1.4187 (2)

[For prepn. of \tilde{C} from hexyne-1 (1:8055) with dry HCl + BiCl₃ in C₆H₆ (20% yield {1}) together with 40% yield 2,2-dichlorohexane (3:9342)) or with AcCl + SnCl₄ (15% yield {2}) together with 37% 4-chloro-octen-3-one-2, b.p. 75-95° at 20 mm.) sec {1} (2); for prepn. of \tilde{C} (60.5% yield {1}) from 2,2-dichlorohexane (3:9342) with KOH in *n*-propyl alc. at 95° sec {1}.]

 \tilde{C} in CCl₄ + SbCl₅ treated with Cl₂ at 35-40° gives (1) (3) cis-1,2-dichlorohexene-1 (3:9330) (26.7% yield (1)) together with 25.4% 1,1,2,2-tetrachlorohexene (3:9332).

Liquid with penetrating odor. - Insol. aq., eas. sol. alc., ether.

[For prepn. of $\bar{\mathbb{C}}$ from ethyl methyl ketone (butanone-2) (1:5405) with $\mathbb{C}l_2$ in pres. of $\mathbb{C}a\mathbb{C}O_3$ + aq. (yields of $\bar{\mathbb{C}}$ about 75% always accompanied by 25% of the isomeric 1-chlorobutanone-2 (3:8012)) see (2) (6) (7) (10) cf. (11); with $\mathbb{C}l_2$ as vapor-phase chlorination see (12) (13) (14); with $\mathbb{C}l_2$ diluted with dry $\mathbb{C}O_2$ see (15) (4); with $\mathbb{C}l_2$ in sunlight see (5) (16); with $\mathbb{S}O_2\mathbb{C}l_2$ in sunlight see (5) (16) (17) cf. (11); with N-chlorourea in dil. AcOH see (1) (8); for prepn. of $\bar{\mathbb{C}}$ from acetyl chloride (3:7065) with ethylene over activated carbon at 100° and 50 atm. see (18) (note that acetyl chloride + ethylene $+ AlCl_3$ at 0° gives 4-chlorobutanone-2 (3:7640) q.v.); for prepn. of $\bar{\mathbb{C}}$ from 2-chlorobutene-2 (3:7105) with $\mathbb{C}l_2$ + aq. + $\mathbb{C}Cl_4$ (65% yield) see (3).]

[\bar{C} on reduction using yeast (20) gives levorotatory 3-chlorobutanol-2, b.p. 139° (cf. 3:8000), but with Zn + HCl (15) \bar{C} yields butanone-2 (1:5405).]

 \bar{C} on oxidn. with conc. HNO₃ (5) (16) (20) yields α -chloropropionic acid (3:6125).

Č on hydrolysis with aq. in s.t. at 150° for 6–8 hrs. (15), or Č with alc. alk. (15) or MeOH/ KOH (21) in cold, gives (84% yield (21)) butanone-2-ol-3 (acetyl-methyl-carbinol) (acetoin) (1:5448) (as consequence of latter reactn. Č reduces Tollens' reagt. or Fehling's soln. in cold).

C with satd. aq. NaHSO3 soln. yields (15) a NaHSO3 addn. cpd.

[\bar{C} with conc. aq. KCN at 0° for 1 hr. gives (80% yield (21)) 2,3-epoxy-2-methyl-n-butyronitrile (α -cyano- α , β -dimethyl-ethylene oxide), b.p. 145°, $D_4^{20}=0.9540$, $n_D^{20}=1.4079$ (21); \bar{C} with alc. KCN gives (21) a mixt. consisting mainly of the above prod. together with a little α -methylacetoacetonitrile [Beil. III₂-(433)], b.p. 182–184° at 745 mm. with slight decompn. (22), b.p. 78° at 19 mm. (22), 68–70° at 12 mm. (23). (Note that the above represents a correction of the earlier views (5) (16) (24).)]

[Č with conc. aq. (NH₄)₂SO₃ at 70° yields (9) butanone-2-sulfonic acid-3.—Č with NaN₃ in aq. contg. AcOH yields (10) 3-azidobutanone-2, oil, b.p. 46° at 2 mm.]

[C with Na in abs. ether gives (15) by bimolecular coupling 3,4-dimethylhexanedione-2,5 [Beil. I-798, I₁-(409), I₂-(847)], b.p. 210° (15), 82° at 11 mm.; note therefore that sodium must not be used for drying C cf. (24).]

[\bar{C} with triethyl orthoformate (1:3241) in abs. alc. in pres. of NH₄Cl as cat. gives (70% yield in 10 days but in absence of NH₄Cl only 39% (24)) α -chloroethyl methyl ketone diethylacetal, b.p. 80–84° at 36 mm., $D_4^{20}=0.9773$ (24).]

[C with ethyl sodio-acetoacetate in abs. ether (4) or abs. alc. (25) (26) (24) gives (yields: 45-60% (24), 27-28% (26)) the expected ethyl α,β -diaceto-n-butyrate [Beil. III-757, III₁-(265), III₂-(468)], b.p. 150° at 28 mm. (25), 121-124° at 11 mm. (26). — C with ethyl acetoacetate (1:1710) + aq. NH40H + NH₃ gas htd. for 1 hr. gives (26% yield (4)) 3-carbethoxy-2,4,5-trimethylpyrrole [Beil. XXII-31, XXII₁-(497)], yel. cryst. from alc. or pet. eth., m.p. 101.5-102.5° (4), 104-105° (27), also obtd. from the above ethyl α,β -diaceto-n-butyrate with conc. aq. NH₄0H on warming (4). — C with methyl acetoacetate (1:1705) + conc. aq. NH₄0H in the cold gives (4) methyl β -aminocorotonate, m.p. 82-84° (4), which only on htg. condenses with the ester to give 3-carbomethoxy-2,4,5-trimethyl-pyrrole [Beil. XXII-31], cryst. from dil. alc., m.p. 124.5-126° (4). — C with methyl acetoacetate (1:1705) + CH₃NH₂ (33% in aq.) refluxed for some hours gives only very small yield (28) of 3-carbomethoxy-1,2,4,5-tetramethylpyrrole, cryst. from lgr., m.p. 101° (28).]

[C with diethyl acetonedicarboxylate (1:1772) in dry ether at -15° treated with NH₃ gas gives (10.7% yield (29)) 2-carbethoxymethyl-3-carbethoxy-4,5-dimethylfuran, b.p. 110-115° at 0.2 mm. (29).]

[For condens. of C with various phenols and phenol ethers see (30).]

[C with alc. NH₃ gives (15) in the cold the difficultly isolatable 3-aminobutanone [Beil. IV-319, IV₁-(452)], but on warming this condenses bimolecularly yielding (15) (8) tetramethylpyrazine [Beil. XXIII-99, XXIII₁-(28)], ndls. with 3H₂O from aq., m.p. 74-77°, but aq. lost in desic. to anhydrous prod., m.p. 86° (8) (corresp. picrate, m.p. 194-195° (31)). — C with aniline (2 moles) gives (15) on refluxing 2,3-dimethylindole [Beil. XX-319, XX₁-(130)], m.p. 107-109° (15).]

[C with thioformamide in abs. alc. for 4 days at 0° gives (22% yield (17)) 4,5-dimethylthiazole, b.p. 81-83° at 59 mm. (17) (corresp. picrate, cryst. from alc., m.p. 186-187° (17)).

— C with NH4 dithiocarbamate in abs. alc. refluxed ½ hr. gives (40% yield (17)) 2-mercapto-4,5-dimethylthiazole, cryst. from EtOAc, m.p. 163.5-163.8° (17). — C with benzamide + powd. CaCO₃ htd. at 110-120° for 10 hrs. gives (24% yield (32)) 4,5-dimethyl-2-phenyl-oxazole [Beil. XXVII₁-(219)], m.p. 50°, b.p. 128-130° at 5 mm. (32). — C with thiobenzamide + NaOAc htd. in abs. alc. gives (65% yield (32)) 4,5-dimethyl-2-phenylthiazole, b.p. 126-128° at 6 mm. (32).]

³⁻Chlorobutanone-2 semicarbazone: m.p. 148°, or on slow htg. 143-145° dec. (33), 127° (1).

Note. Much confusion exists in the literature with reference to the relation between Č and 3-chloro-2,2-dimethylbutane (3:7475) q.v. Since the identity of the latter has now been established, it is probable that the chloride obtained from 2,2-dimethylbutanol-3 (ter-butyl-methyl-carbinol) ("pinacolyl alcohol") (1:6186) is Č. In view, however, of modern appreciation of the rearrangements frequently occurring during the formation of alkyl chlorides with HCl, the homogeneity of all recorded samples of Č should be taken with reserve.

[For prepn. of \bar{C} from 2,3-dimethylbutanol-2 (1:6187) with HCl gas (4), with 40% HCl (4), or with AcCl (4), or from 2,3-dimethylbutanol-2 (1:6187) with HCl gas (5), see indic. refs.; for formn. of \bar{C} from 2,3-dimethylbutane (di-isopropyl) (1:8515) with Cl₂ (1) or from 2,3-dimethylbutene-2 (tetramethylethylene) (1:8290) with HCl see (3); for formn. of \bar{C} (23% yield) from ter-butyl chloride (3:7045) + 2,3-dimethylbutane (1.8515) on shaking $\frac{1}{2}$ minute with AlCl₃ see (6).]

Dimethyl-isopropyl-acetamide: m.p. 128° (7), 125-127° (6). [From C via conversion to RMgCl, carbonation to dimethyl-isopropyl-acetic acid, and conversion of latter to amide (6) (7).]

 (1)

For prepn. of C from 2.4-dimethylpentanone-3 (di-isopropyl ketone) (isobutyrone) (1:5433) with PCls see (1).

Č with alc. KOH gives (1) 2,4-dimethylpentadiene-2,3 (tetramethylallene) [Beil. I-258, I_{1} -(121)], b.p. 70° (1), 86.5° at 763 mm. [Beil. I_{1} -(121)].

3:7605 (1) Henry, Ber. 8, 400 (1875).

B.P. 118-120° sl. dec. (1)

[For prepn. of C from 2,4-dimethylpentanone-3 (di-isopropyl ketone) (1:5433) with PCl₅ see (1).]

C on distillation loses 1 HCl yielding (1) a chloroolefin C7H13Cl of undetermined structure, but presumably 3-chloro-2,4-dimethylpentene-2.

C on htg. with alc. KOH loses 2 HCl yielding (1) a hydrocarbon C_7H_{12} , b.p. 70°, regarded (1) as 2.4-dimethylpentadiene-2,3 [Beil. I-258, I₁-(121)].

3:7610 (1) Henry, Ber. 8, 400 (1875).

3: 7615
$$d$$
, l -2,3-DICHLOROBUTANE $C_4H_8Cl_2$ $(d$, l - θ -Butylene dichloride) CH_3 — CH — CH — CH_3 I_1 -(38) I_2 -(82) B.P. 119-120° at 760 mm. (1) $D_4^{25} = 1.1063$ (4) $n_D^{25} = 1.4411$ (4) 119.5° at 760 mm. (2) (3) 1.1051 (2) 1.4410 (4) 117.10° at 746 mm. (4) 1.4409 (4) 53.0-53.5° at 81 mm. (5) 1.4405 (4) 53.1-53.4° at 80 mm. [See also meso-2,3-dichlorobutane (3:7580).]

52.7-53.5° at 80 mm. (4)

Note that constants on the products of other workers (6) (7) (8) (9) (since they were almost certainly mixts. of C with its meso isomer) are not included above.

[For prepn. of C from cis-butene-2 with Cl₂ in light (80.5% yield (4)) (5) cf. (7) see indic. refs.; for formn. of C from d,l-erythro-3-chlorobutanol-2 (3:8004) or from (+) 3-chlorobutanol-2 with PCl₃ or with SOCl₂ + pyridine see (4); for formn. of C from (+) three-3chlorobutanol-2 (3:8002) with SOCl₂ see (4).]

[For prepn. of ordinary samples of C (probably contg. more or less meso-2,3-dichlorobutane (3:7580)) see the following: for prepn. of ord. C from butene-2 with Cl₂ (8) (9) (10) (11) at -10° (60% yield (12)), at -17° in dark (13), or at 0-5° in dark (89-92% yield (14)), or with $Cl_2 + aq$. (15) see indic. refs.; for form. of \bar{C} from 1-chlorobutane (3:7160) with SbCl₅ on warming see (6) (7); from 2-chlorobutane (3:7125) with Cl₂ in light see (3).]

[For equilibrium consts. of system \bar{C} + aq., 3-chlorobutanol-2 (3:8000) + aq., and ternary system \ddot{C} + 3-chlorobutanol-2 + aq. see (16); for uses of \ddot{C} as industrial solvent see (14).]

[C with Cl₂ (slight excess) in dark at -17° gives (13) 36.5% 1,2,3-trichlorobutane (3:5935) + 18% 2,2,3-trichlorobutane (3:5680).

 $|\bar{C}|$ with alc. KOH (1 mole + 25% excess) refluxed for 3 days loses 1 HCl giving (2) (3) a mixt. of cis + trans 2-chlorobutene-2 (3:7105); note, however, that under certain conditions C with NaOEt not only loses 1 HCl but involves a reaction of the second halogen atom with a second mole of NaOEt thus yielding (17) ethyl α,β -dimethylvinyl ether (2ethoxybutene-2) (accompanied by some butyne-2 (dimethylacetylene)). — \tilde{C} with excess alc. KOH, soda-lime, or diethylaniline (18), or C with aq. vapor at 200-500° over silica gel]+ cat. (19) (20), loses 2 moles HCl yielding (35-38% (20)) butadiene-1,3 (accompanied by 21-25% 2-chlorobutene-2 (3:7105) (20) and 6-8% ethyl methyl ketone (1:5405) (20)); note that in absence of water vapor in this last process \bar{C} yields 2-chlorobutene-2 (3:7105) + butene-2 (20). — \bar{C} over BaCl₂ at 200-300° (24) or with aq. alk. or alk.-earth hydroxides at 118-250° (25) loses 1 HCl giving 2-chlorobutene-2 (3:7105).]

[Č is not (3) hydrolyzed by boilg. aq. K₂CO₃, but Č with aq. Ca (OH)₂ at 75° (21) or with aq. Na₂CO₃ + NaHCO₃ under press. (22) cf. (23) yields butanediol-2,3 (some 2-chlorobutene-2 (3:7105) and ethyl methyl ketone (1:5405) also being formed (22)).]

[Č with p-toluidine (6 moles) at 130-140° for 30 hrs. gives (10) d,l-bis-2,3-(di-p-toluidino)-butane, m.p. 62-63°, + meso-bis-2,3-(di-p-tolylamino) butane, m.p. 57-58°, + 2,7,9-trimethylacridine, m.p. 133-134°; on more protracted htg. or at higher temperature the prods. are mainly or even exclusively 2,7,9-trimethylacridine and di-p-tolylamine, m.p. 79° (from the reagent) (10).]

3: 7620 1-CHLOROHEXENE-2 $C_6H_{11}Cl$ Beil. S.N. 11 $(\gamma-(n-\text{Propyl})\text{allyl chloride})$

CH₃.CH₂.CH₂.CH=CH.CH₂

B.P. 120-122° at 751 mm. (1) 42-44° at 40 mm. (1)

Two geom. stereoisomers of \bar{C} are possible, but only one is yet recognized. Furthermore \bar{C} by virtue of allylic transposition would be expected to be in equilibrium with its synionic isomer 3-chlorohexene-1 (α -(α -propyl)allyl chloride). The material reported by (1) was regarded as \bar{C} ; the isomer appears to be as yet unrecorded; however, see 3:9334.

[For prepn. of C from hexen-1-ol-3 [Beil. I₂-(485)] with PCl₃ in C₆H₆ see (1).]

[For reactn. of C with sodium phenate in alc. see (1).]

C on cat. hydrogenation gives 1-chlorohexane (3:7955), b.p. 126-127° (1).

Č on hydrolysis with hot aqueous 10 N NaOH for $2\frac{1}{2}$ hrs. yields (1) hexen-1-ol-3, b.p. $54-57^{\circ}$ at 20 mm., $n_D^{25} = 1.4485$ (1).

3:7630 (1) Hurd, McNamee, J. Am. Chem. Soc. 54, 1648-1649 (1932).

B.P.
$$121.5^{\circ}$$
 at 746 mm. (sl. dec.) (1) $D_{15}^{15} = 1.114$ (1) $119-120^{\circ}$ at 740 mm. (2) $119-121^{\circ}$ at 740 mm. (3) $113-116^{\circ}$ at 740 mm. (3) (4)

Note that the same observers have noted (3) two dif. b.p.'s, viz., 119-121° and 113-116° both at 740 mm., on dif. prepns.; this anomaly is still unexplained.

[For prepn. of \bar{C} (75% yield (5)) from paraldehyde (1:0170) + AcCl (3:7065) + trace ZnCl₂ see (5) (1); from acetaldehyde (1:0100) + AcCl (3:7065) at 100° see (6); from vinyl acetate + liq. (3) or gas (7) HCl see (3) (7).]

 $\ddot{\mathbf{C}}$ on htg. with 0.02% ZnCl₂ at 80° yields acetaldehyde (1:0100) + AcCl (3:7065) + paraldehyde (1:0170) (8); $\ddot{\mathbf{C}}$ passed through a tube at 360-380° or over pumice at 250-300° yields acetaldehyde + acetyl chloride (9).

 \bar{C} with aq. slowly hydrolyzes in cold, more rapidly on warming, yielding acetaldehyde (1:0100), AcOH (1:1010), and HCl. [This hydrolysis is accelerated by trace of acid, e.g., N/10 HCl (10).]

3:7625 (1) Franchimont, Rec. trav. chim. 1, 245-246 (1882). (2) Descudé, Compt. rend. 132, 1568 (1901). (3) Gebauer-Fuelnegg, Moffett, J. Am. Chem. Soc. 56, 2009 (1934). (4) Ulich, Adams, J. Am. Chem. Soc. 43, 663 (1921). (5) Colonge, Mostafavi, Bull. soc. chim. (5) 5, 1485-1486 (1938). (6) Simpson, Ann. 109, 156-157 (1859). (7) Ger. 313,696, July 19, 1919; Cent. 1919, IV 664. 3:7630 1-CHLOROHEXENE-1

Cl C₆H₁₁Cl Beil. S.N. 11

B.P. 121-121.5° (1)
$$D_{-}^{22} = 0.8872$$
 (1) $n_{D}^{22} = 1.4300$ (1)

[For formn. of \bar{C} (together with other prods.) from either 3,3-dichloropropene-1 (3:5140) or 1,3-dichloropropene-1 (3:5280) with n-propyl MgBr see (1).]

C does not react with NaOEt at 130° (1).

C readily reacts with Na yielding (1) hexene-1 (1:8255), b.p. 64°.

 \tilde{C} adds \tilde{B}_{12} yielding (1) 1,2-dibromo-1-chlorohexane, b.p. 107° at 13 mm., $D_-^{24}=1.664$, $n_D^{24}=1.515$ (1).

3:7630 (1) Kirrmann, Grard, Compt. rend. 190, 876-877 (1930); Bull. soc. chim. (4) 47, 843-847 (1930).

3:7640 4-CHLOROBUTANONE-2

' (β-Chloroethyl methyl ketone; 1-chlorobutanone-3)

[See also 3-chlorobutanone-2 (3:7598).]

Liquid with faint and not disagreeable odor.

[For prepn. of \tilde{C} from methyl vinyl ketone [Beil. I-728, I₁-(379), I₂-(786)] satd. at 0° with HCl gas directly (67% yield (4)) or in C₆H₆ soln. (5); from acetyl chloride (3:7065) with ethylene + AlCl₃ at 0° (yields: 33% (3), 53% (6)) of. (2) or at 100° and 50 atm. press. (22); from 4-chlorobutadiene-1,2 (3:7225) by cat. hydration with conc. H₂SO₄ at -5° (yield 54% crude \tilde{C} (1)); from β -chloropropionyl chloride (3:5690) with Zn(CH₃)₂ (60% yield (7)); from butanol-1-one-3 (γ -keto-n-butyl alcohol) by saturation with HCl gas at 0° espec. in pres. of 5-10% AlCl₃ (63% yield (8)) see indic. refs.] — [Note that \tilde{C} is not formed by chlorination of ethyl methyl ketone (butanone-2) (21).]

 \tilde{C} with hot aq. alk. or alk. carbonates gives only resins, but \tilde{C} on boilg. with dimethylaniline or better diethylaniline loses HCl giving (yields: 30% and 80%, respectively (7)) methyl vinyl ketone (see above), b.p. 79–80°; note, however, that \tilde{C} on warming with alc. KOH or quinoline loses both HCl and H₂O yielding (4) a mixt. of dienes, b.p. 65–75°.

[For behavior of potential \tilde{C} (mixt. of methyl vinyl ketone + HCl gas in C_6H_6) with ethylene glycol (1:6465) see (5); for reactn. of \tilde{C} with trimethylene glycol (1:6490) + K yielding γ -hydroxypropyl γ -keto-n-butyl ethel see (3).]

[$\ddot{\mathbf{C}}$ with β -naphthol (1:1540) in EtOH/KOEt at 0° for 3 days gives (59% yield (9)) 1-(γ -keto-n-butyl)naphthol-2, cryst. from aq. alc., m.p. 88-89° (corresp. semicarbazone, pale yel. pr. from MeOH, m.p. 179-180° (9)).]

[Č with 2-methylcyclohexanone (1:5470) in EtOH/NaOEt (or sodium isopropylate/isopropyl alc.) at 0° for 18 hrs. gives (yields: 15% (10), 10% (20)) 2-keto-10-methyl-2,3,4,5,6,7,8,10-octahydronaphthalene, b.p. 129-133° at 12 mm., $n_{\rm p}^{12} = 1.5250$ (10).]

[$\bar{\mathbf{C}}$ with diethyl sodio-methylmalonate in ether gives (11) diethyl (methyl)-(γ -keto-n-butyl)malonate, b.p. 114-116° at 0.4 mm.; $\bar{\mathbf{C}}$ with ethyl α -isopropylacetoacetate in EtOH/NaOEt as directed yields (13) ethyl Δ -(1)p-menthenone-3-carboxylate-4.]

[C with aniline + conc. HCl or 40% H₂SO₄ htd. with nitrobenzene or H₃AsO₄ yields (14) (6) lepidine (4-methylquinoline) [Beil. XX-395, XXI₁-(150)]; for corresp. reactn. with other amines see (14) (6).]

[\bar{C} with 1-aminoanthraquinone [Beil. XIV-177, XIV₁-(436)] in pyridine yields (15) 1-(γ -keto-n-butylamino)anthraquinone, dark red cryst. which dye cellulose acetate.]

[\bar{C} with hydrazine hydrate in MeOH gives (80% yield (16)) (17) (19) by ring closure 3-methyl- Δ^2 -pyrazoline [Beil. XXIII-30], lıq., b.p. 56° at 15 mm. (16), sol. aq. but forming the corresp. picrate, \bar{B} .PkOH, yel. ndls. from alc., m.p. 153° (16) (17) (19). — \bar{C} in AcOH with methylhydrazine sulfate + NaOAc in aq. stood 2 nrs. gives (18) 1,3-dimethyl- Δ^2 -pyrazoline, oil, which with ethereal picric acid gives the corresp. picrate, \bar{B} .PkOH, m.p. 131.5-132.5° (18). — \bar{C} with phenylhydrazine in ether gives (16) by ring closure 3-methyl-phenyl- Δ^2 -pyrazoline, ndls. from ether by addn. of pet. ether, m.p. 76-77° (16).]

[\bar{C} with NH₂OH.HCl + K₂CO₃ in aq. MeOH htd. for a few minutes gives (20% yield (16)) by ring closure 3-methyl- Δ^2 -isoxazoline [Beil. XXVII-12], oil, b.p. 60° at 15 mm. (16).]

- ① 1-Carbamido-3-methyl-Δ²-pyrazoline: ndls. from EtOAc, m.p. 167-168° (18), 167° (16). [Note that C̄ with 1 equiv. semicarbazide HCl + NaOAc in aq. immediately ppts. the corresp. semicarbazone; this on htg. for 10 min. with strong aq. NaOAc (or C̄ + semicarbazide HCl + strong NaOAc soln. htd. directly in dil. alc. (19)) loses HCl and ring-closes to the indicated deriv.]
- ① 1-Phenyl-3-methyl-Δ²-pyrazoline: ndls. from ether on addn. of pet. eth., m.p. 76-77° (16), 77° (1). [From C in ether with phenylhydrazine, followed by neutralization and drying with anhyd. K₂CO₃ (16) (1); note that the presumably intermediate phenylhydrazone loses HCl and by ring closure gives the indicated deriv.]

B.P. 120-123° (1)

$$D_{20}^{20} = 1.130 (1)$$
 $n_{\rm D}^{20} = 1.464 (1)$

Note. Č by virtue of facile allyllic transposition easily isomerizes to 1,1-dichlorobutene-2 (3:7685) q.v.

[For prepn. of \bar{C} from crotonaldehyde (1:0150) with PCl₅ see (1) (2); the resulting mixt. of \bar{C} with its synionic isomer (1,1-dichlorobutene-2) (supposed by (2) to have been only the latter) has been separated by very precise fractnl. distn. (1).]

C with NaOEt yields (1) 1-chloro-3-ethoxybutene-1, b.p. 132-133° at 760 mm., 54-55° at 46 mm., $D_{16}^{16} = 0.960$, $n_{10}^{16} = 1.432$ (1).

C with NaOAc yields (1) 1-chloro-3-acetoxybutene-1, b.p. 57-58° at 16 mm., $D_{17}^{17} = 1.090$, $n_D^{17} = 1.443$ (1). [Note that crotylidene diacetate (1,1-diacetoxybutene-2), prepd. (95% yield (3)) from crotonaldehyde (1:1050) with Ac₂O, gives (3) with dry HCl the isomeric 3-chloro-1-acetoxybutene-1, b.p. 64° at 13 mm., $D_{20}^{20} = 1.083$, $n_{-}^{20} = 1.451$ (3).]

3:7650 (1) Kirrmann, Compt. rend. **199**, 1228–1229 (1934). (2) Kekulé, Ann. **162**, 98–100 (1872). (3) Kirrmann, Bull. soc. chim. (5) **5**, 917–918 (1938).

B.P. 120-123° dec. (1)

[For prepn. of Č from hexen-1-ol-4 (allyl-ethyl-carbinol) [Beil. I-444] with PCl₅ see (1).] Č with alc. KOH yields (1) hexadiene-1,3 [Beil. I-253], b.p. 72-74°.

3:7655 (1) Fournier, Bull. soc. chim. (3) 15, 402, 886 (1896).

3:7657 3-CHLORO-2-METHYL-1,2-EPOXYPROPANE C₄H₇OCl Bell. S.N. 2362 ("β-Methylepichlorohydrin") CH₆Cl

B.P. 122.0° (1)
$$D_4^{20} = 1.1025$$
 (1) $n_D^{20} = 1.4340$ (1)

Colorless liq.; \tilde{C} is sol. aq. to extent of 3 g. in 100 g. aq. at 20° (1). — \tilde{C} with aq. forms a const.-boilg. mixt. (b.p. 89.8°) contg. 74.4% \tilde{C} + 25.6% aq. (1).

[For prepn. of C from 1,3-dichloropropanol-2 (dichloro-ter-butyl alcohol) (3:5985) with aq. Ca(OH)₂ (93% yield (1)) see (1) (2); from chloroacetone (3:5425) with diagomethane in ether see (3).]

 \bar{C} with aq. especially at elevated temps., or \bar{C} stirred for 3 hrs. at 90-95° with aq. contg. 0.1% H₂SO₄ until mixt. becomes homogeneous, gives (1) (4) (by hydration through ring opening) 95% yield (1) 3-chloro-2-methylpropanediol-1,2 (β -methylglycerol monochloro-hydrin) (3:9190). [Note that alk. also catalyzes this hydration but reacts with the prod.] [Note also that HCl may not be used since it adds to the epoxy ring yielding (3) 1,3-dichloro-2-methylpropanol-2 (3:5977).]

 \ddot{C} on distn. with 12% H₂SO₄ at ord. press. yields (1) (5) quant. α -methylacrolein (" methacrolein") [Beil. I-731].

 \ddot{C} with conc. aq. NH₄OH + alk. yields (1) 1,3-diamino-2-methylpropanol-2 [Beil. IV₂-(739)].

71.0-71.5° at 100	mm. (10)		

[See also 2-chloro-2-methylpropanol-1 (3:7905).]

Colorless liq. somewhat sol. aq.; 100 g. aq. at 20° dis. 18.6 g. Č (note also that 100 g. Č at 20° dis. 19 g. H₂O) (9). — Č forms with aq. a const.-boilg. mixt., b.p. 93-94° at 760 mm., contg. 34% aq. (9).

[For prepn. of \bar{C} from 3-chloro-2-methylpropene-1 (methallyl chloride) (3:7145) or from 1-chloro-2-methylpropene-1 (θ,β -dimethylvinyl chloride) (3:7120) by cat. hydration of their unsatd. linkage (63-66% yield) see (9) (11); note that the former with 80% H₂SO₄ at 0° or the latter with 90% H₂SO₄ at -10° to 0° stirred for 2½ hfs., poured onto ice, and distilled gives 63-66% of the initial chloride as \bar{C} ; note that other acids can also be used for this hydration, e.g., 85% H₃PO₄, 70% HNO₃, 60% HClO₄, benzenesulfonic acid, etc., each having its own optimum conditions (9); note also that in this process some 32-18%

respectively of the initial chloride is not hydrated but partially isomerized to a mixt. contg. 90% β , β -dimethylvinyl chloride (3:7120) + 10% methallyl chloride (3:7145) irrespective of whichever one was initially employed (9).]

[For prepn. of Č from 1,2-dichloro-2-methylpropane (isobutylene dichloride) (3:7430) by liq.-phase hydrolysis of the more reactive halogen atom under neutral (or even slightly acidic or basic) conditions (best yield 48% by refluxing 18 hrs. with aq.) see (10).]

[For prepn. of \bar{C} from chloroacetone (3:5425) or ethyl chloroacetate (3:5700) with MeMgBr (yields: 60% (5), 38% (12)) (3) (6) or MeMgI (20% yield (4)) see (3) (5) (6) (12) (note that \bar{C} is accompanied (as a result of reaction of a second MeMgBr (13) (14)) by some 2-methylbutanol-2 (1:6160)); for prepn. of \bar{C} from isobutylene with HOCl (yields: 64% (6), 63% (1), 60% (7), 47% (2)) (5) (15), with $Cl_2 + H_2O$ (16) (17) in pres. of 10% CuCl₂ (80-85% yield (24)), or with ter-butyl-hypochlorite (3:7165) (18) see indic. refs.; for formn. of \bar{C} from 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117) with HCl gas in ether see (19) (6) (4) (1) (note, however, that the prod. is a mixt. consisting of about $\frac{1}{2}$ \bar{C} contaminated with about $\frac{1}{2}$ of the isomeric 2-chloro-2-methylpropanol-1 (3:7905)).] [For formn. of \bar{C} from 1-amino-2-methylpropanol-2 hydrochloride with conc. HCl in s.t. at 100° see (12).]

[Č on reduction with Na/Hg in dil. HCl yields (2) (15) 2-methylpropanol-1 (isobutyl alcohol) (1:6165); this unexpected result presumably is due to intermediate formation of isobutylene oxide (1:6117) which on reduction opens the ring to give isobutyl alc. (not ter-butyl alcohol).]

[\overline{C} on protracted oxidation, e.g., with mixt. of 1.5 wt. pts. fumg. HNO₃ + 3.5 wt. pts. conc. HNO₃ at 75° for 20 hrs. (2), gives traces of chloroacetone (3:5425) and a little oxalic acid (1:0445) and α -chloroisobutyric acid (3:0235) (5).]

C on refluxing with aq. is slowly (e.g., 56% in 14 hrs. (2)) (21) converted to isobutyraldehyde (1:0120); note that this reaction carried out above 100° under press. (20) is greatly accelerated.

[C with warm conc. HCl yields (10) (5) 1,2-dichloro-2-methylpropane (3:7430).]

 \ddot{C} on solution in cold 45% H_2SO_4 followed by warming loses H_2O and yields (9) a mixt. consisting of about 90% 1-chloro-2-methylpropene-2 (methallyl chloride (3:7145)) accompanied by about 10% 1-chloro-2-methylpropene-1 (β,β -dimethylvinyl chloride) (3:7120); a mixt. of these two chlorides has also been obtd. by use of P_2O_5 (1) (2) or anhydrous oxalic acid (2) (22).]

[C added dropwise to dry powdered KOH, NaOH, CaO, or Ca(OH)₂ loses HCl and gives (95% yield using NaOH (10), 67% using KOH (6)) 1,2-epoxy-2-methylpropane (isobutylene oxide) (1:6117), b.p. 56.0-56.5° cf. (24).]

 $[\bar{C}$ with aq. alkali ultimately yields 2-methylpropanediol-1,2 (isobutylene glycol) (1:6446) or its polymerization products; for study of kinetics of reaction of \bar{C} with aq. alk. see (4) (8).

[\bar{C} with KCN in 4 vols. 80% alc. refluxed for 15-20 min. gives (45-50% yield (23)) β -hydroxy-isovaleronitrile [Beil. III-328], b.p. 210-212° at 756 mm., 130-132° at 30 mm., f.p. -12° , $D_{-}^{20} = 0.96762$, $n_{D} = 1.42911$ (23).]

[\tilde{C} with aq. 23% EtNH₂ (4 moles) in s.t. at 100° for 8 hrs. gives (70-75% yield (25)) 1-(ethylamino)-2-methylpropanol-2, b.p. 156° (\tilde{B} .HCl, m.p. 151° (25)). — \tilde{C} with aq. Et₂NH refluxed 3-4 hrs. gives (60% yield (26)) 1-(diethylamino)-2-methylpropanol-2, b.p. 164-165° at 761 mm. (26), $D_4^{20}=0.8382$ (27), $n_D^{20}=1.4253$ (27) (\tilde{B} .PkOH, m.p. 99-100° (26)). — For reactn. of \tilde{C} with N-methylaniline, N-ethylaniline, or di-n-butylamine see (27).]

⁻⁻⁻⁻ Chloro-ter-butyl acetate: b.p. 154° at 760 mm. (28), 153-154° (5), $D_4^{15} = 1.0626$ (28), $n_D^{15} = 1.4340$ (28). [From $\bar{C} + AcCl$ (5); also indirectly (28% yield (28)) from

isobutylene + N,N'-dichlorourea in AcOH.] — [For analogous indirect prepn. of the formate, chloroacetate, and trichloroacetate see (28).]

 \tilde{C} is pract. insol. aq.; for precise data see (11) (225). — \tilde{C} is very eas. sol. alc., ether, C_6H_6 , $CHCl_3$, CS_2 . — For detn. of \tilde{C} in mixt. with C_6H_6 and the dichlorobenzenes see (226) (227). — For use of \tilde{C} as immersion fluid in refractometry see (228). — For toxicity of \tilde{C} see (229). — For brief study of detn. of vapors of \tilde{C} in air using a combustion method see (230).

Selected data and references on physical properties of mixts. of \bar{C} with other cpds. (for additional data and references on many other systems see Beilstein).

Binary systems. \tilde{C} with H_2O forms a const.-boilg. mixt., b.p. 90.2° at 760 mm., contg; 71.6° \tilde{C} (41) (use in sepn. of \tilde{C} from polychlorobenzenes see (69)): \tilde{C} with acetone (1:5400).

vapor/liq. equilibrium see (13): $\bar{\mathbb{C}}$ with acetic acid (1:1010), f.p./compn. data and diagrams (eutectic, m.p. -48.5° , contg. $97\%\bar{\mathbb{C}}$ (28)) see indic. refs.: $\bar{\mathbb{C}}$ with C_6H_6 (1:7400), f.p./compn. diagram see (24): $\bar{\mathbb{C}}$ with aniline, liq./vapor equil., D_{25}^{25} /compn., etc., see (43): $\bar{\mathbb{C}}$ with nitrobenzene, f.p./compn. data + diagram (eutectic, m.p. -50.7° contg. 78.3 wt. $\%\bar{\mathbb{C}}$) see (21): $\bar{\mathbb{C}}$ with pyridine, f.p./compn. data + diagram (eutectic, m.p. -63.5° , contg. $54\%\bar{\mathbb{C}}$) and also n_D^{25} /compn. diag. see (28): $\bar{\mathbb{C}}$ with o-chlorotoluene (3:8245), f.p./compn. diagram (eutectic, m.p. abt. -71° , contg. 39.4 mole $\%\bar{\mathbb{C}}$) see (44); $\bar{\mathbb{C}}$ with m-dichlorobenzene (3:5960), f.p./compn. data, see (23): $\bar{\mathbb{C}}$ with benzoyl chloride (3:6240), f.p./compn. data see (45): $\bar{\mathbb{C}}$ + ethylene dibromide, f.p./compn. dag. (eutectic, m.p. -55° contg. 83 mole $\%\bar{\mathbb{C}}$) see (44); vapor-press. equil. see (46): $\bar{\mathbb{C}}$ + bromobenzene, f.p./compn. diagram (no eutectic) see (22) (24); for use in testing efficiency of distillation columns see (39): $\bar{\mathbb{C}}$ + iodobenzene, f.p./compn. diagram (eutectic, m.p. -51.5° , contg. $57\%\bar{\mathbb{C}}$) see (22) (24): $\bar{\mathbb{C}}$ with fluorobenzene, f.p./compn. diagram (complex system) see (22) (24).

Ternary Systems. \bar{C} with aq. + HCl forms ternary const.-boilg. mixt., b.p. 96.6° at 756 mm., contg. 74.5 wt. $\%\bar{C} + 20.2$ wt. % aq. + 5.3 wt. % HCl (41): \bar{C} with aq. + acetone, solubility diagram see (47): \bar{C} + ethylene glycol (1:6465) + acetone, soly. of system at 23° see (48).

Preparation of \tilde{C} . Because of the magnitude of the literature on this topic only a few selected references can be given here; reference should also be made to Beil. V-199, V_1 -(109) and V_2 -(148).

[For prepn. of \bar{C} from C_6H_6 with Cl_2 in pres. of $SnCl_4$ at 30-40° (49), with NOCl at 425° (50), with $HCl + O_2$ (air) + cat. (51) see indic. refs.; for discussion of prepn. of industrial \bar{C} see (52); for study of photochem. chlorination of C_6H_6 see (53).]

[For prepn. of \bar{C} from aniline via formn. of benzenediazonium chloride/ZnCl₂ cpd. and htg. with molten phenol (40% yield $\bar{C}+26\%$ hydroxybiphenyl + 20% diphenyl ether (54)) or by isolation of solid benzene diazonium chloride and cautious decompn. by warming in various org. solvents see (55); from p-chloroanline via formn. of p-chlorobenzenediazonium chloride/ZnCl₂ cpd. and htg. latter with EtOH (67% yield) or EtOH + Zn dust (60% yield) see (54); from phenylhydrazine by oxidn. with aq. FeCl₃ at 70° (61% yield) or with HClO₃ (30% yield) see (56); from C₆H₅MgBr with ethyl hypochlorite (3:7022) (60% yield (57)), sulfuryl chloride (57), benzenesulfonyl chloride (yields: 52% (58), 25% (57)), other aromatic sulfonyl chlorides (58) (57), N-chloropiperidine and other N-chloroanines (59), or N-chloro-p-chlorobenzaldimine (60), see indic. refs.]

[For formn. of \bar{C} from benzoyl chloride (3:6240) on htg. in porcelain tube at 550-600° see (61); from benzeneazotriphenylmethane on warming in CCl₄ see (62); from bis-(p-chlorophenyl)zinc by reaction with aq. see (63); from phenylboric acid with Cl₂/aq. or refluxed with aq. CuCl₂ (85% yield) see (64); from C₆H₆ + n-butyl chlorosulfonate + AlCl₃ (11% yield) see (65); from C₆H₆ with SeCl₄ + AlCl₃ see (66); from 4-chlorodiphenyl sulfide by htg. with sulfur see (67); from 2-chlorobenzophenone (3:0715) or 4-chlorobenzophenone (3:1914) on fusion with KOH/NaOH see (68).]

Pyrolysis. Č passed over Pt wire at bright red heat (70) or through hot Fe tube (71) yields 4,4'-dichlorobiphenyl (3:4300) accompanied by biphenyl (1:7175), 4-chlorobiphenyl (3:1912), and other products.

Reduction. \tilde{C} in EtOH at 55° with excess H_2 at 3 atm. in pres. of Adams' cat. readily (72) yields cyclohexane (1:8405). $-\tilde{C}$ with H_2 or $NH_2.NH_2$ in MeOH or EtOH in pres. of Pd/CaCO₃ gives (73) cf. (74) small yields of biphenyl (1:7175). $-\tilde{C}$ with Na in boilg. EtOH (75), or Na/Hg in EtOH (76), or Na in AmOH (77), or NaOAm in AmOH (78) is dehalogenated, but extent of reactn. varies with conditions. $-\tilde{C}$ with HI + P is unaffected at 300° but at 375° yields (79) benzene. $-\tilde{C}$ in aq. or dil. alc. alk, with H_2 in pres. of Ni

splits off all (80) its halogen as HCl. — $\bar{\rm C}$ with H₂ + Ni at 270° yields (81) benzene + biphenyl.

Behavior with chlorine. \bar{C} with Cl_2 may add or substitute or both according to conditions. — \bar{C} under dil. aq. NaOH with excess Cl_2 in sunlight (82) or with Cl_2 at 0° in dark as directed (83) (84) gives (90% yield (83)) heptachlorocyclohexane [Beil. V-23, V₂-(12)] (known in 2 stereoisomeric forms, " α ," m.p. 146° (82), " β ," m.p. 260° (82)). [For study of relative amts. addition and substitution with $\bar{C} + Cl_2$ see (85).]

 \bar{C} with Cl₂ in pres. of AlCl₃ (86), Al/Hg (87), or FeCl₃ (86), or \bar{C} with SO₂Cl₂ + S₂Cl₂ + AlCl₃ (88), or \bar{C} htd. with FeCl₃ (89) or PbCl₄.2NH₄Cl (90), gives mainly 1,4-dichlorobenzene (3:0980) accompanied by other products. — \bar{C} with Cl₂ at 400–700° in pres. of cat. yields (91) (92) 1,3-dichlorobenzene (3:5960) + 1,3,5-trichlorobenzene (3:1400) and other products.

Behavior with bromine. \bar{C} with Br₂ (93) under aq. (82) or in pres. of AlCl₃ (94), Al/Hg (95), Al (99), or Fe (99), or \bar{C} htd. with FeBr₃ (96), gives mainly 4-bromochlorobenzene [Beil. V-209, V₁-(116), V₂-(162)], m.p. 66°, together with other products; for study of rate in AcOH see (97). — \bar{C} with Br₂ at elevated temp. gives greatly increased proportion of meta-bromochlorobenzene; e.g., \bar{C} with Br₂ at 475° gives (98) 53% m-, 27% p-, and 20% o-bromochlorobenzenes.

Behavior with metals. \bar{C} with Li in dry ether under dry N₂ gives (35-49% yield (100)) phenyllithium [Beil. XVI₁-(589)]; for reactns, of latter with fluoro, chloro, bromo, or iodobenzene see (101).

 $\bar{\mathbf{C}}$ on boilg, with Na yields (102) $\mathrm{C_6H_6}$, biphenyl, and other products; $\bar{\mathbf{C}}$ with Na in boilg, toluene yields mainly (102) $\mathrm{C_6H_6}$ together with other prods. — $\bar{\mathbf{C}}$ with amylsodium (from amyl chloride + Na) in lgr. gives (103) (104) (105) phenylsodium [Beil. XVI₁-(589)] which with $\mathrm{CO_2}$ gives (105) benzoic acid; $\bar{\mathbf{C}}$ with Na + diethyl carbonate in $\mathrm{C_6H_6}$ gives (79% yield (106)) (for use of other esters such as methyl benzoate, ethyl benzoate, or diethyl oxalate in ether see (107)) or $\bar{\mathbf{C}}$ with Na + benzophenone in $\mathrm{C_6H_6}$ gives (98% yield (106)) (108) triphenylcarbinol (1:5985). — $\bar{\mathbf{C}}$ with Na + AsCl₃ in xylene gives (82% yield (109)) triphenylarsine; $\bar{\mathbf{C}}$ with Na + SbCl₃ in xylene yields (109) triphenylstibine.

 \bar{C} with Mg/Cu alloy in pres. of I_2 (110), or \bar{C} with Mg in s.t. at 150-160° for 3 hrs. (111) (112), or \bar{C} refluxed with Mg + Cu₂Cl₂ (113), gives (yields: 80% (110), 85% (111)) phenyl magnesium chloride.

Behavior with Al halides. \bar{C} does not react with AlCl₃ even on long boilg. (dif. from bromobenzene and iodobenzene which react at once) (114). — \bar{C} with freshly prepared fused AlBr₃ yields (115) bromobenzene.

Behavior with AlCl₃ + other compounds. \tilde{C} (2 moles) with CCl_4 (1 mole) + AlCl₃ (1.75 moles) in CS_2 gives (116) (117) bis-(4-chlorophenyl)dichloromethane [Beil.V -592], m.p. 52-53°, together with other products; \tilde{C} (6 moles) with CCl_4 (1 mole) + AlCl₃ (1 mole) htd. at 60-70° gives mainly (118) 2-chlorophenyl-bis-(4-chlorophenyl)chloromethane [Beil. V-703], m.p. 153°, accompanied by a small amt. tris-(4-chlorophenyl)chloromethane [Beil. V-703], m.p. 113°.

 \tilde{C} with AcCl (3:7065) or Ac₂O + AlCl₃ yields p-chloroacetophenone (3:6735) q.v. for details.

 $\ddot{\mathbf{C}}$ + furoic acid (1:0475) + AlCl₃ gives (18% yield (119)) 6-chloronaphthoic acid-1 (3:4845); $\ddot{\mathbf{C}}$ + methyl furoate (1:3452) + AlCl₃ gives in good yield (120) methyl 6-chloronaphthoate.

 \ddot{C} with phthalic anhydride (1:0725) + AlCl₃ gives (121) (122) (123) (124) o-(4-chlorobenzoyl)benzoic acid [Beil. X-750, X₁-(356)], m.p. 147-148°, which on ring closure with

cone. H₂SO₄ yields 2-chloroanthraquinone (3:4922) q.v. [For corresp. reactns. of Č with 4-bromophthalic anhydride (125), 4-sulfophthalic anhydride (126), naphthalene-1,2-dicarboxylic acid anhydride (127), or naphthalene-2,3-dicarboxylic acid anhydride (128) see indic. refs.]

Miscellaneous condensations. \bar{C} with acetylene + AlCl₃ gives (129) 1,2-bis(4-chlorophenyl)ethane (4,4'-dichlorodibenzyl) + other prods., cf. also (130). — \bar{C} with propylene in pres. of sulfonic acids at 86–130° gives (131) isopropylbenzene (cumene) (1:7440). — \bar{C} + hexene-3 + H₂F₂ gives (25% yield (132)) 4-chloro-(1'-ethylbutyl)benzene. — \bar{C} + cyclohexene + conc. H₂SO₄ gives (50% yield (133)) 4-chlorophenylcyclohexane. — \bar{C} + allyl chloride (3:7035) + conc. H₂SO₄ gives (133) 1-chloro-2-(p-chlorophenyl)propane.

 \tilde{C} + isopropyl alc. with 80% H₂SO₄ at 70° gives (72% yield (134)) 4-chloro-isopropyl-benzene (3:8705). $-\bar{C}$ with ter-butyl alc. + AlCl₃ gives (135) 4-chloro-ter-butylbenzene; \bar{C} with ter-amyl alc. + AlCl₃ gives (135) 4-chloro-ter-amylbenzene.

 $\ddot{\mathbf{C}}$ + CO + AlCl₃ + TiCl₄ at 60 atm. and 30-35° (136) or $\ddot{\mathbf{C}}$ + HCN + AlCl₃ at 100° for 6 hrs. (137) gives p-chlorobenzaldehyde (3:0765). — $\ddot{\mathbf{C}}$ + CO + cat. + steam at 300-400° (138) (139) gives benzoic acid. — $\ddot{\mathbf{C}}$ with paraformaldehyde + ZnCl₂ (140) (142) or $\ddot{\mathbf{C}}$ with formalin + HCl (141) or $\ddot{\mathbf{C}}$ with chloromethyl methyl ether (3:7085) + ZnCl₂ (142) or $\ddot{\mathbf{C}}$ with bis-(chloromethyl) ether (3:5245) + ZnCl₂ (142) yields p-chlorobenzyl chloride (3:0220) q.v. — $\ddot{\mathbf{C}}$ with p-chlorobenzyl chloride (3:0220) + H₂SO₄ yields (142) 4.4'-dichlorodiphenylmethane.

Č with chloral (3:5210) or chloral hydrate (3:1270) + conc. or fumg. H₂SO₄ gives 1,1,1-trichloro-2,2-bis-(p-chlorophenyl)ethane ("DDT") (3:3298) q.v.

Hydrolysis. \bar{C} is unaffected by protracted boilg. with aq. or even alc. alk.; however, by use of increased temp. and press. especially in pres. of catalysts the hydrolysis of \bar{C} constitutes an extremely important industrial process for manufacture of phenol.

For general studies on the catalytic hydrolysis of \bar{C} to phenol with steam at elevated temperatures see (143) (144) (145) (146); for patents employing this method see (147)–(159) incl. — For résumé of prepn. of phenol via Raschig method ($C_6H_6+HCl+O_2$ to \bar{C} with subsequent hydrolysis) see (160); for relevant patents see (161) (162) (163). — For sepn. of products of hydrolysis see (41) (164).

Č may also be hydrolyzed to phenol by means of aq. NaOH, Ca(OH)₂, Na₂CO₃, NaHCO₃, etc., at elevated temp. and press. especially in pres. of catalysts, notably copper: for impt. general review of these methods up to 1927 see (165); for general discussion see (166); for recent patents on this process and its variants see (167)–(182) incl. — For conv. of Č with alk. to 4-hydroxybiphenyl (1:1585) see (183) or to diphenyl ether (1:7125) see (184) (185) (186).

 \tilde{C} htd. with aq. Na₂S, NaSH, or H₂S under press. gives (187) (188) (189) (190) diphenyl sulfide and/or thiophenol. — \tilde{C} + H₂S + cat. at 700° gives (191) thiophenol.

[For use of C in prepn. of sulfur dyes by htg. with sulfur see (192) (193).]

Ammonolysis. \bar{C} with dry NH₃ does not react even in pres. of Cu + I₂ and high temp. and press. (194). — However, \bar{C} with conc. aq. NH₄OH htd. at high temp. and press. especially in pres. of Cu, Cu cpds., or other cat. yields aniline and/or diphenylamine; for general discussion of this reactn. see (195) (196) (197) (198) (199); for illustrative patents see (200)–(208) incl.; for purification of reactn. prod. see (209) (210). — For behavior of \bar{C} with Na in liq. NH₃ (211) and its use in detn. of halogen content of \bar{C} (212) see indic. refs. — For behavior of \bar{C} with KNH₂ in liq. NH₃ see (213) (214).

Nitration. \tilde{C} on mononitration, e.g., with mixt. of 10 ml. HNO₃ (D=1.52) + 50 ml. HNO₃ (D=1.48) for 25 g. \tilde{C} at 0° (215), gives a prod. contg. 69.9% p-chloronitrobenzene [Beil. V-243, V₁-(130), V₂-(183)], m.p. 82°, together with 29.8% o-chloronitrobenzene [Beil. V-241, V₁-(129), V₂-(180)], m.p. 32°; the p/o ratio is but little different at -30°;

for f.p./compn. curve of system p-chloronitrobenzene/o-chloronitrobenzene (eutectic, m.p. 14.7°, contg. 33.1% p-isomer) see (215). — For mononitration using 0.9 g. of 70% HNO₃ + 1.29 g. 94% H₂SO₄ per gram of \bar{C} (216) or using nitrosulfonic acid (from fumg. HNO₃ treated with SO₂) at 30° (217) or using Fe(NO₃)₃ in Ac₂O at 40–45° (218) see indic. refs. — Note that no appreciable amt. of m-chloronitrobenzene is formed by direct nitration of \bar{C} .

Č on dinitration, e.g., with 5 wt. pts. of a mixt. consisting of equal wts. of 92.8% HNO₃, 93.3% H₂SO₄, and fumg. H₂SO₄ (contg. 14.2% SO₃) at 95° for 2 hrs. (219) gives 96.7% yield 2,4-dinitrochlorobenzene [Beil. V-263, V-(137), V₂-(196)], cryst. from alc., m.p. 52-53°. [The other dinitro isomers are known but need not be discussed here.]

Sulfonation. \bar{C} is insol. in cold conc. H_2SO_4 ; however, \bar{C} on warming or on stdg. at room temp. for 48 hrs. (220) with equal wt. conc. H_2SO_4 dissolves and later ppts. p-chlorobenzenesulfonic acid [Beil. XI-54, XI₁-(14)], anhydrous cryst. from CHCl₃, m.p. 92-93° (220), monohydrate from aq., m.p. 67° (221). — \bar{C} with fumg. H_2SO_4 (10% SO_3) below 60° for 1 hr. then poured into 6 vols. satd. aq. NaCl soln. gives (222) (223) sodium salt of p-chlorobenzenesulfonic acid which with PCl₅ yields corresp. sulfonyl chloride (see below). — For reactn. of \bar{C} with ClSO₃H see below. — [The corresp. bis- (4-chlorophenyl) sulfone [Beil. VI-327, VI₁-(149)] which may be formed in small amt. has m.p. 147-148°.] [For study of kinetics of sulfonation of \bar{C} see (231).]

- **p-Bromochlorobenzene:** \bar{C} with 0.25-0.50 mole Br₂ at 60° in pres. of Fe gives (88% yield (99)) p-bromochlorobenzene, cryst. from alc., m.p. 67-68°.
- ② 2,4-Dinitrochlorobenzene: C on htg. with mixt. of HNO₃ + H₂SO₄ (see above under nitration) at 95° for 2 hrs. gives (96.7% yield (219)) 2,4-dinitrochlorobenzene, cryst. from alc., m.p. 52-53°.

$$C_6H_{11}Cl$$
 Beil. I — Cl CH_3 I_1 — I_2 —(194)

B.P. 132–133° at 759 mm. (1) $D_2^{20} = 0.92653$ (1) $n_D^{20} = 1.44193$ (1)

[For prepn. of C from dimethyl-cyclopropyl-carbinol [Beil. VI-10] by shaking with conc. HCl see (1) (2.5-dichloro-2-methylpentane (3:8550) is also formed (1)).

 \tilde{C} on prolonged treatment with KOAc + AcOH yields (1) corresp. acetate, b.p. 170-171°, $D_A^{20} = 0.9108$, $n_D^{20} = 1.43107$ (1).

 \bar{C} with NaOEt yields (1) corresp. ethyl ether, 5-ethoxy-2-methylpentene-2, b.p. 142-143°, $D_{4}^{20} = 0.7989$, $n_{1}^{20} = 1.41948$ (1).

 \tilde{C} on protracted boilg. with aq. + CaCO₃, followed by further treatment with alc. KOAc + a little NaI, regenerates (1) dimethyl-cyclopropyl-carbinol, b.p. 124-125° at 762 mm. $D_A^{20} = 0.8800$, $n_D^{20} = 1.43237$ (1).

3:7915 (1) Bruylants, Dewael, Bull. sci. acad. roy. Belg. (5) 14, 140-153 (1928); Cent. 1928, I 2708; C.A. 22, 3883 (1928).

3: 7917
$$d$$
, l -2-CHLOROPROPANOL-1 CH_3 — CH — CH_2 C_3H_7OCl Beil. I - 356 (Propylene β -chlorohydrin; Cl OH I₂-(369) B.P. 133–134° cor. at 762 mm. (1) $D_-^{20} = 1.103$ (1) $n_D^{20} = 1.43623$ (1) 133–134° at 761 mm. (2) 133–134° at 760 mm. (3) $D_4^{15} = 1.4505$ (9) $n_D^{15} = 1.4766$ (9) 133° (10) 94° at 8 mm. (9)

[See also 1-chloropropanol-2 (3:7747).]

[For prepn. of \bar{C} from its acetate (see below) by alcoholysis with excess boilg. dry MeOH for 8 hrs. (83% yield) see (1); note that this prepn. really starts from the isomeric 1-chloropropanol-2, the conversion of which to \bar{C} involves the following steps: reaction with KOAc yielding CH₃.CH(OH).CH₂(OAc), conversion of latter with HCl + ZnCl₂ to CH₃.CH(Cl).-CH₂(OAc), and finally alcoholysis to \bar{C} as mentioned above (1) (4); for formn. of \bar{C} by alk. hydrol. of its trichloroacetate see (9).]

[Note that although \bar{C} is formed in other ways (e.g., from propanediol-1,2 (propylene glycol) (1:6455) with HCl or S₂Cl₂ (5), from 2,3-epoxybutane (propylene oxide) (1:6115) by addn. of HCl (5), from propylene with HOCl (5), or from α -chloro-n-propylamine with HNO₂ (6)) the product of these reactions appears to be (5) (6) an inseparable mixt. of about 40% \bar{C} with 60% of the isomeric 1-chloropropanol-2 (3:7747).]

Reactions of the halogen atom of \tilde{C} . $[\tilde{C}$ when added dropwise to conc. aq. KOH loses HCl yielding (1) 2,3-epoxybutane (propylene oxide) (1:6115), b.p. 35°. — \tilde{C} with KCN in 80% alc. contg. some NaI gives on warming (60% yield (2)) β -hydroxy-n-butyronitrile [Beil. III-309, III₂-(221)], b.p. 214-215° (2); note that this is not the product to be expected from simple replacement of Cl by CN and apparently results from preliminary formation of propylene oxide to which HCN then adds so as to give a straight (rather than forked) carbon chain.]

Reactions of the OH group of C. [C reacts normally as a substituted primary alc. giving ethers, esters, oxidn. products, etc.]

[$\bar{\mathbf{C}}$ readily gives the corresp. ethers; e.g., $\bar{\mathbf{C}}$ with Me₂SO₄ on warming gives $\langle 7 \rangle$ β -chloro-n-propyl methyl ether, b.p. 98–99° at 756 mm., $D_4^{20}=0.9946$, $n_D^{20}=1.40754$ $\langle 7 \rangle$; $\bar{\mathbf{C}}$ with EtOH + conc. H₂SO₄ on htg. gives (54%) yield $\langle 7 \rangle$) β -chloro-n-propyl ethyl ether, b.p. 116–117° at 758 mm., $D_4^{20}=0.9828$, $n_D^{20}=1.41285$ $\langle 7 \rangle$; for corresp. formn. of ethers with n-propyl alc. (1:6150) and with allyl alc. (1:6145) see $\langle 7 \rangle$.]

[\bar{C} (1 mole) with SO₂Cl₂ (2.5 moles) at 130° gives (16% yield {7}) bis-(β -chloro-n-propyl) ether, b.p. 188° at 762 mm., $D_4^{20} = 1.109$, $n_D^{20} = 1.4467$ (7); note that this ether is not obtd. from \bar{C} with cone. H₂SO₄ (7).]

[\bar{C} on oxidn. with 3 wt. pts. conc. HNO₃ as directed (8) (2) gives (85% yield (2)) α -chloropropionic acid (3:6125), accompanied by some acetic acid (1:1010) and oxalic acid (1:0445); note that \bar{C} on oxidn. with chromic acid yields no α -chloropropionic acid but only acetic acid (1:1010) and formic acid (1:1005) (2).]

- β-Chloro-n-propyl acetate [Beil. II-129, II₁-(58), II₂-(139)]: oil, insol. aq., b.p. 151-152° at 768 mm. (11), 152-153° at 750 mm. (1). [Prepd. indirectly; furthermore the prods. reported may be contaminated with some of the isomeric β-chloroisopropyl acetate cf. (10).]
- ---- β-Chloro-n-propyl benzoate: unreported.
- β -Chloro-n-propyl β -nitrobenzoate: unreported.
- ------ β -Chloro-n-propyl 3,5-dinitrobenzoate: unreported.

2-(Phthalimido)propanol-1 (N-(β-hydroxyisopropyl)phthalimide); lfts. from EtOAc m.p. 99-101° (10). [Prepd. indirectly (10); note that the prod. obtd. (10) from C with K phthalimide in s.t. at 200-230° was the isomeric 1-(phthalimido)propanol-2, m.p. 88-89° (10), but whether this result was due to contamination of C with the isomeric 1-chloro-propanol-2 (3:7747) or the rearr, has never been clarified.

3:7935 2-CHLOROPENTANONE-3
$$(\alpha$$
-Chloroethyl ethyl ketone; α -chlorodiethyl ketone) CH₃.CH₂—C—CH—CH₃ I_1 — I_2 —

B.P. 135° (1) (2) 145° (3)

Oil, insol. aq., sol. alc., ether.

[For prepn. of Č from pentanone-3 (diethyl ketone) (1:5420) with Cl₂ (3) (4), with Cl₂ in pres. of aq. + CaCO₃ (86% yield (1)), or with Cl₂ in vapor-phase chlorination (4) see indic. refs.; from 4-chloro-4-methyl-3-ethylisoxazolone-5 [Beil. XXVII-163] with hydrochloric acid see (2).]

 $\ddot{\mathbf{C}}$ on reduction with \mathbf{H}_2 yields (3) pentanone-3 (1:5420).

C does not (3) form a cpd. with satd. aq. NaHSO3 soln.

Č dis. readily in aq. alk. yielding a soln. (presumably contg. pentanone-3-ol-2) which readily reduces NH₄OH/AgNO₃ and reduces Fehling's soln. on warming (3).

[C in abs. alc. treated with NH₃ gas yields (3) 2,5-dimethyl-3,6-diethylpyrazine [Beil. XXIII-101], liq., b.p. 215-217°, forming with aq. a sublimable hydrate, m.p. 42.5°. (Note that 3-chloropentanone-2 (3:7893) similarly treated gives the same prod.)]

3:7935 (1) Justoni, Chimica e industria (Italy) 24, 89-94 (1942); Cent. 1943, I 383. (2) Hanriot, Reynaud, Bull. soc. chim. (3) 21, 14-15 (1899). (3) Demetre-Vladesco, Bull. soc. chim. (3) 6, 834-835 (1891). (4) Justoni, Chimica e industria (Italy) 24, 195-201 (1942); Cent. 1943, I 1659.

[For prepn. of \bar{C} from 2-methylhexanol-2 (n-butyl-dimethyl-carbinol) [Beil. I-415, I₂-(444)] (5) (6) with dry HCl gas at -10° (65-75% yield (6)) or at $10-15^\circ$ (75% yield (5)) (8), with conc. HCl (1), or with AcCl (1) (2) see indic. refs.; for formn. of \bar{C} as byproduct during reactn. of the above carbinol with $C_6H_6+AlCl_3$ (main prod. 45% yield of 2-methyl-2-phenylhexane, b.p. $106-109^\circ$ at 20 mm.) see (4); for prepn. of \bar{C} from 2-methylhexanol-3 (isopropyl-n-propyl-carbinol) [Beil. I-416, I₁-(206)] (3) with dry HCl at 0° (80% yield (3)) by rearrangement see (3).]

[For data on density and parachor of C at 25°, 50°, and 75° see (7).]

Č with Mg in dry ether as specified (5) gives 74.4% yield corresponding RMgCl.

 \bar{C} converted (as above) to RMgCl and the latter oxidized with O_2 gives (42% yield (3)) 2-methylhexanol-2, b.p. 139.5–140.5° at 741 mm., 110° at 250 mm., $D_4^{20}=0.813, n_D^{20}=1.4173$ (3).

[For reactn. of RMgCl with ethyl chloroformate (3:7295) yielding (5) ethyl n-butyl-dimethyl-acetate, b.p. 66.5– 70.0° at 16 mm., $n_{\rm D}^{20}=1.4148$ (5) (corresp. amide, m.p. 92.8–93.8° (5)) see (5); for reactn. of RMgCl with AcCl (3:7065) giving (9% yield (5)) 3,3-dimethylheptanone-2, b.p. 68– 70.5° at 20 mm., $n_{\rm D}^{20}=1.4206$ (semicarbazone, m.p. 129–130°) (5) see (5).]

Č converted to RMgCl and treated with CO₂ gives (5) n-butyl-dimethylacetic acid (constants not given (5)) (corresp. amide via acid chloride, m.p. 92.8-93.8° u.c. (5)).

CHAPTER XVIII

DIVISION B. LIQUIDS WITH BOILING POINTS REPORTED AT ORDINARY PRESSURE

Section 2. D_4^{20} less than 1.1500

(3:8000-3:8499)

3:8000 3-CHLOROBUTANOL-2
$$CH_3$$
- CH - CH_3 - CH_9OCl Beil. I - 373 (β -Butylene chlorohydrin; Cl OH I_1 - I_2 -(403) chlorohydrin)

B.P.
$$138-140^{\circ}$$
 (1) $D_0^{18} = 1.0692$ (3) (4) $n_D^{20} = 1.4422$ (9) $138-139^{\circ}$ at 753 mm. (2) $136.0-137.5^{\circ}$ at 760 mm. (3) (4) $134-138^{\circ}$ (9) $76-79^{\circ}$ at 100 mm. (5)

[See also d,l-erythro-3-chlorobutanol-2 (3:8004) and d,l-threo-3-chlorobutanol-2 (3:8002).]

 $\bar{\mathbf{C}}$ in this present discussion designates the ordinary mixture of stereoisomeric configurations of 3-chlorobutanol-2.

Colorless somewhat viscous liq. of agreeable odor. $-\bar{C}$ is sol. at 20° in 15 vols. aq. (2); its sepn. from dilute aq. solns. is best effected by steam distillation at reduced pressure (6) cf. (9).

[For prepn. of \bar{C} from ordinary butene-2 (mixt. of cis and trans stereoisomers) by addn. of HOCl (yields: 55% {11}, 50% {3}, 20% {5}) {4} {1} {2}, with Cl₂ + steam at 100° (60–65% \bar{C} together with 10–30% 2,3-dichlorobutane (3:7615) {6}), with Cl₂ + aq. at 40–50° (50–60% yield (6)) {9}, or with N-chlorourea in dil. aq. acid 15–17° in pres. of CuCl₂ (best yield 79.9% \bar{C} + 20.1% 2,3-dichlorobutane (3:7615) obtd. in 5% AcOH (7), but proportion of the two products varies widely with nature of acid used) see indic. refs.]

[For tabular and graphic data on equilibrium consts. of binary system \bar{C} + aq., and ternary system \bar{C} + 2.3-dichlorobutane (3:7615) + aq. see (8).]

Č in s.t. at 180°, or Č with aq. in s.t. at 100° for 10 hrs. or at 120° for 3 hrs., gives (80–100% yield (3)) (10) butanone-2 (ethyl methyl ketone) (1:5405) + HCl (cf. also (14)).

[\bar{C} with solid KOH (5), or with 40-50% aq. NaOH or KOH (15-20% excess) at 75-90° (11) (10), or with aq. KOH, K_2CO_3 , or PbO at ord. temp. (3) (4) (2) causes elimination of HCl and gives (yields: 87-90% (11), 75-81% (10), 66% (5)) 2,3-epoxybutane (α,β -dimethylethylene oxide) (1:6116) (mixt. of cis and trans stereoisomers).

[The simple alkyl ethers of \tilde{C} have been prepared by indirect means; e.g., from butene-2 by action of corresp. alkyl hypochlorites dislvd. in the corresp. alc. or by action of N,N'-dichlorourea in the corresp. alc.: e.g., methyl ether (3-chloro-2-methoxybutane), b.p. 116°, $D_4^{15}=1.0230,\ n_{D_4}^{14}=1.4225$ (12); ethyl ether (3-chloro-2-ethoxybutane), b.p. 122-124°, $D_4^{15}=0.9812,\ n_{D_4}^{15}=1.4260$ (12); for n-propyl, isopropyl, and isoamyl ethers see (12).]

- ---- 3-Chlorobutyl-2 benzoate: b.p. 263-265.5 u.c. (7).
- ---- 3-Chlorobutyl-2 p-nitrobenzoate: unreported.
- ---- 3-Chlorobutyl-2 3,5-dinitrobenzoate: unreported.

B.P. 130.8° at 748 mm. (1)
$$D_4^{25} = 1.0586$$
 (1) $n_D^{25} = 1.4386$ (1) 52.0 ° at 30 mm. (1) $D_4^{20} = 1.0626$ (2) $D_D^{20} = 1.4403$ (2) $D_4^{20} = 1.0626$ (2) $D_D^{20} = 1.4403$ (2)

[See also ord. 3-chlorobutanol-2 (3:8000) and d,l-erythro-3-chlorobutanol-2 (3:8004).]

[For prepn. of Č from cis-2,3-epoxybutane (1:6116) (2 moles) with conc. HCl (3 moles) at 5° or below (77% yield) see (1); from cis-butene-2 with ter-butyl hypochlorite (3:7165) in AcOH/H₂SO₄ (61% yield (1)) or with Ca(OCl)₂ in AcOH (2) see indic. refs.; from the diacetate of meso-butanediol-2,3 (1:6452) in conc. HCl contg 1 drop conc. H₂SO₄ with large excess dry HCl gas at —10° for 90 hrs. (43% yield) see (1). — Note that Č cannot be obtd. from butene-2 with aq. N-chloroacetamide (1).]

 $[\bar{C}\ (1\ mole)\ with\ SOCl_2\ (1.5\ moles)\ refluxed\ 3\ hrs., then kept at 100° for\ 3\ hrs. more, gives <math>(17.4\%\ yield\ \{1\})\ d_1l^2$,3-dichlorobutane (3:7615); note, however, that $\bar{C}\ (1\ mole)$ with SOCl₂ $(2\ moles)\ htd.\ 2\ hrs.\ at\ 95° in\ pres.\ of\ pyridine\ gives <math>(24\%\ yield\ \{1\})\ meso-2,3$ -dichlorobutane (3:7580). — Note that $\bar{C}\ with\ conc.\ HCl\ or\ with\ conc.\ HCl\ +\ ZnCl_2\ fails$ to give any dichlorobutane; note also that $\bar{C}\ fails\ to\ react\ with\ 60\%\ HBr\ even\ in\ s.t.\ at\ 100° for\ 3\ hrs. <math>\{1\}$.

[Č with very conc. aq. KOH at 90-95° loses HCl and gives (75% yield (1)) cis-2,3-epoxybutane (1:6116).]

3:8002 (1) Lucas, Gould, J. Am. Chem. Soc. 63, 2541-2551 (1941). (2) Wilson, Lucas, J. Am. Chem. Soc. 58, 2396-2402 (1936).

B.P. 135.4° at 748 mm. (1)
$$D_4^{25} = 1.0610$$
 (1) $n_D^{25} = 1.4397$ (1) $55.9-56.1$ ° at 30 mm. (1)

[See also ord. 3-chlorobutanol-2 (3:8000) and d,l-threo-3-chlorobutanol-2 (3:8002).]

[For prepn of \bar{C} from trans-2,3-epoxybutane (1:6116) (2 moles) with conc. HCl (3 moles) at 5° or below (82 5% yield) see {1}.]

[$\bar{\mathbb{C}}$ (1 mole) with SOCl₂ (1.5 moles) refluxed 3 hrs., then kept at 100° for 3 more hrs gives (16% yield {1}) meso-2,3-dichlorobutane (3:7580); $\bar{\mathbb{C}}$ (1 mole) in pyridine (2.2 moles) treated with SOCl₂ (2 moles) at 100° for 3 hrs. gives (63% yield {1}) d,l-2,3-dichlorobutane (3:7615), and $\bar{\mathbb{C}}$ (3 moles) with PCl₃ (1 mole) at 100° for 3 hrs also gives (20% yield {1}) d,l-2,3-dichlorobutane (3:7615); note, however, that $\bar{\mathbb{C}}$ (1 mole) with PCl₅ (3.9 moles) in CHCl₃ refluxed 2 hrs. gives (42.7% yield {1}) a mixt. of d,l- and meso- forms of 2,3-dichlorobutane. — Note that $\bar{\mathbb{C}}$ with conc. HCl or with conc HCl + ZnCl₂ fatls to give any dichlorobutane; note also that $\bar{\mathbb{C}}$ fatls to react with 60% HBr even in s.t at 100° for 3 hrs. {1}.] $[\bar{\mathbb{C}}$ with aq. KOH loses HCl and gives (1) trans-2,3-epoxybutane (1:6116).]

3:8004 (1) Lucas, Gould, J. Am. Chem. Soc. 63, 2541-2551 (1941).

50-53° at 28 mm. (2)

50-51° at 20 mm. (3)

Principal component of comml. "amylene dichloride" (5).

[For prepn. of \bar{C} from pentene-2 (unsym.-ethyl-methyl-ethylene) (1:8215) + Cl_2 at -17° (3) or below -5° (4) see indic. refs.; for formn. of \bar{C} (together with other products) from pentane (1:8505) + Cl_2 see (2) (5).]

 \bar{C} on boilg. with 10% alc. KOH gives (2) 2-chloropentene-2 (3:7285), but \bar{C} with aq. K_2CO_3 gives no pentanediol-2,3 (see below).

C on boilg, with Zn dust in alc. or on htg. with Na in xylene at 120° gives (6) pentene-2 (1:8215).

 $[\tilde{C} + aq. \text{ vapor passed at } 300^{\circ} \text{ over MgCl}_2 \text{ gives } (48-50\% \text{ yield (7)}) \text{ pentadiene-1,3} (1:8035).]$

Č on protracted (250 hrs.) boilg. with 35 pts. aq. gives (3) traces of the corresp. glycol, pentanediol-2,3 [Beil. I-482], and either or both pentanone-2 (1:5415) and/or pentanone-3 (1:5420).

3:8010 (1) Kondakov, Ber. 24, 931 (1891). (2) Lemke, Tishchenko, J. Gen. Chem. (U.S.S.R.) 7, 1995-1998 (1937); Cent. 1939, I 2397; C.A. 32, 482 (1938). 3:8012 1-CHLOROBUTANONE-2 (Chloromethyl ethyl ketone)
$$CH_3$$
— CH_2 — C — CH_2 — CH_3 — CH_4

[See also 3-chlorobutanone-2 (3:7598).]

Liquid with penetrating odor. — Insol. aq.

[For prepn. of \tilde{C} from ethyl methyl ketone (butanone-2) (1:5405) with Cl_2 in pres. of $CaCO_3$ + aq. (yields of \tilde{C} about 25% always accompanied by 75% of the isomeric 3-chlorobutanone-2 (3:7598)) see (1) (3) (6) (10) (12); with Cl_2 in vapor phase (13) (14), with Cl_2 or SO_2Cl_2 in sunlight (8) (11), or with N-chlorourea (5) see indic. refs. — For formn. of \tilde{C} from 1-chlorobutanol-2 (3:8025) by oxidn. with chromic acid (4), from butene-1 with HOCl (4), from 2-chloromethyl-2-ethyl-4-methyl-1,3-dioxolone-5 by hydrol. with AcOH/HCl (9), or from 2-(chloromethyl)butene-1 (3:9214) by ozonolysis (18) see indic. refs.]

[C on reduction using yeast gives (15) 1-chlorobutanol-2 (3:8025).]

C on oxidn. with HNO₃ (8) (11) yields chloroacetic acid (3:1370).

[C on hydrolysis, e.g., by refluxing overnight with K formate in MeOH, yields (1) butanone-2-ol-1 (propionyl-carbinol) [Beil. I-826, I₂-(870)], b.p. 153-154°, 50.5-51.0° at 14 mm. (1); note, however, that C with K acetate in EtOH gives (6) (8) (11) (65-70% yield (6)) propionyl-carbinyl acetate, b.p. 176° (8) (11), 178-180° (6).]

[C with conc. aq. KCN even in the cold yields (8) (11) the corresp. nitrile, propionylacetonitrile [Beil. III-671], b.p. 164-165° (8) (11), colorless liq., insol. aq. — C with conc. aq. (NH₄)₂SO₃ at 70° yields (7) butanone-2-sulfonic acid-1. — C with NaN₃ in aq. contg. AcOH yields (10) 1-azidobutanone-2, oil, b.p. 56° at 2 mm. (10).]

[C with thiourea refluxed for 2 hrs. gives (72% yield (16)) 2-amino-4-ethylthiazole hydrochloride, cryst. from alc./acetone, m.p. 185.5-187.5° u.c.; this salt with conc. aq. NH₄OH gives the free base, m.p. 35°, b.p. 118-120° at 7 mm. (16) (corresp. acetyl deriv., m.p. 117.5° u.c. (16)). — C with thiobenzamide + NaOAc htd. in alc. gives (67% yield (17)) 4-ethyl-2-phenylthiazole, yel. cryst. from xylene, m.p. 117-118° (17).]

Č with phenylhydrazine yields (4) a prod., yel. cryst. from AcOH, m.p. 210-215° dec., whose structure is in doubt.

- ① Chloromethyl ethyl ketone semicarbazone: m.p. 121° (5), 120-121° (18).
- © Condens. prod. of C with N-methyl-β-carbohydrazidopyridinium p-toluenesulfonate: cryst. from 1:1 EtOH/ether, m.p. 136-137° cor. (19). [From C + indicated reagent refluxed 15 min. in abs. alc. (19).]
- ① 1-(Phthalimido)butanone-2: ndls. from hot aq., m.p. 107° (12). [From Č with K phthalimide in dry xylene 2 hrs. at b.p. (27% yield (12)).]

$$d$$
, l -3,4-DICHLOROPENTENE-2 Cl Cl C₅H₈Cl₂ Beil. I - 210 CH₃—CH₂—CH—CH₃ I₁—I₂—

B.P. 142-144° at 736 mm. (1)

Two geom. stereoisomers of \bar{C} are possible, but as yet only this one is recognized. [For prepn. of \bar{C} from 3-chloropenten-2-ol-4 with PCl₃ see (1).]

Č on boilg, with aq. is partially reconverted (1) to 3-chloropenten-2-ol-4 [Beil. I-443], b.p. 158-159° at 724.4 mm.

C adds Br₂ yielding (1) 2,3-dibromo-3,4-dichloropentane, b.p. 140-145° at 31 mm. (1).

3:8045 (1) Garzarolli-Thurnlackh, Ann. 223, 160-161 (1884).

B.P.
$$140-145^{\circ}$$
 (1)
 $140-144^{\circ}$ (5)
 $86-90^{\circ}$ at 104 mm. (5)
 49° at 21 mm. (2)
 $46-48^{\circ}$ at 12 mm. (3)
 $D_{4}^{18} = 0.879$ (2)

Note that some evidence exists (1) that in certain reactions C reacts (by virtue of allyl transposition) as its synionic isomer 2-chloroheptene-3 (but this has not itself been characterized).

[For prepn. from hepten-2-ol-4 (propenyl-n-propyl-carbinol) [Beil. I-447, I2-(488)]

(1) (4) (p-nitrobenzoate, m.p. 40-41° (2); N-(p-xenyl) carbamate, m.p. 103.5° (2)) with PCl₅ (73% yield (4)) (1) (5) or with PCl₃ + pyridine at 0° (2) see indic. refs.] [The levorotatory isomer of $\bar{\mathbf{C}}$ (from dextrorotatory hepten-2-ol-4, with PCl₃ + pyridine at 0° (2)) has b.p. 44° at 14 mm., $n_D^{21} = 1.4430$ (2).]

[\bar{C} with phenol + K_2CO_3 in acctone gives (65% yield (4)) (3) phenyl α -(n-propyl)crotyl ether, b.p. 153-154° at 23 mm. (4), 103-104° at 4 mm. (3), $D_{20}^{20} = 0.9282$ (3), $n_D^{21} = 1.5000$ (3). — For studies of the rearr. of this ether on htg. see (1).] [For similar reaction of \bar{C} with o-cresol see (3).]

3:8656 (1) Hurd, Williams, J. Am. Chem. Soc. 58, 2636-2637 (1936). (2) Arcus, Kenyon, J. Chem. Soc. 1938, 1918. (3) Hurd, Puterbaugh, J. Org. Chem. 2, 382-384 (1938). (4) Hurd, Cohen, J. Am. Chem. Soc. 53, 1920-1922 (1931). (5) Reif, Ber. 41, 2743 (1908).

[For prepn. of \bar{C} from 3-ethylpentanol-3 (triethylcarbinol) (1:6218) with dry HCl at 10–15° (88% yield (4)), with HCl (1), or with cone. HCl + ZnCl₂ at room temp. (3) see indic. refs.; for formn. of \bar{C} (2% yield (5)) as by-product of reactn. of triethylcarbinol with AlCl₃+ C₆H₆ (main prod. is 40% yield of 3-ethyl-3-phenylpentane, b.p. 225–226° at 745 mm., 107–108° at 20 mm., $n_{c}^{25} = 1.4953$, $n_{c}^{20} = 1.4975$) see (5); for prepn. of \bar{C} from 3-ethylpentene-2 (1:8330) with HCl gas in AcOH (3) or with conc. or fumg. HCl (2) see (2) (3).]

C with Mg in dry ether as directed (4) gives 58% yield corresp. RMgCl.

 $\bar{\mathbf{C}}$ converted (as above) to RMgCl, treated with formaldehyde gas, gives (10% yield (4)) 2,2-diethylbutanol-1, b.p. 75-78° at 12 mm, $n_{\mathrm{D}}^{20} = 1.443$ (4).

3:8655 (1) Schreiner, J. prakt. Chem. (2) 82, 296 (1910). (2) Nasarov, Ber 70, 623 (1937). (3) Lucas, J. Am. Chem. Soc. 51, 252-253 (1929). (4) Whitmore, Badertscher, J. Am. Chem. Soc. 55, 1560-1562, 1566 (1933). (5) Huston, Fox, Binder, J. Org. Chem. 3, 253 (1939).

3:8075 d,I-3,4-DICHLORO-2-METHYLBUTANE
$$C_5H_{10}Cl_2$$
 Beil. I - 137 (Isopropylethylene dichloride) Cl Cl CH_3 I_{1-} (47) I_{2-} I_{2-}

[For prepn. of $\ddot{\mathbf{C}}$ from 3-methylbutene-1 (isopropylethylene) (1:8200) + $\mathbf{Cl_2}$ see (1); for formn. (together with 1,4-dichloro-2-methylbutane (3:8360) and 2,4-dichloro-2-methylbutane (3:8105)) from 4-chloro-2-methylbutane (isoamyl chloride) (3:7365) with $\mathbf{Cl_2}$ in light see (2) (4).]

 \tilde{C} is scarcely attacked by K_2CO_3 (1). — \tilde{C} on boilg. with aq. for 100 hrs. can be recovered unchanged to extent of 85%, the remainder yielding traces of 2-methylbutanediol-1,2 [Beil. I-482], 2-methylbutanene-3 (isopropyl methyl ketone) (1:5410), and 2-methylbutyne-1 (isopropylacetylene) (1:8010) (3).

[Č passed over soda-lime at 470° gives (2) 2-methylbutadiene-1,3 (isoprene) (1:8020).

Colorless mobile liq. with characteristic odor.

[For prepn. from 2,4,4-trimethylpentene-1 (1:8340) or 2,4,4-trimethylpentene-2 (1:8345) ("diisobutylene") with conc. HCl (satd. at -20°) in s.t. at 100° (1) (2), with HCl gas in cold (5) or at -10° to -25° in pres. of ZnCl₂ (4) (almost quant. yield (5)) see indic. refs.] \bar{C} on distillation loses HCl and regenerates "diisobutylene" (4) (2).

C with alc. KOH yields diisobutylene (see above).

[For reactn. of \bar{C} with phenol + alc. NaOC₆H₆ yielding phenyl diisobutyl ether, b.p. 250-260° see (3); note, however, that this prod. in s.t. at 250° for 2 hrs. rearr. to p-(diisobutyl)phenol, m.p. 84° (3).]

[For reaction of \bar{C} with $(CH_3)_2Zn$ yielding 2,2,4,4-tetramethylpentane (1:8645), b.p. 122.3° , $n_D^{25} = 1.4051$, see (4).]

[For reactn. of \tilde{C} with silver cyanate, followed by alk. hydrolysis to yield 4-amino-2,2,4-trimethylpentane (acetyl deriv., m.p. 99°; reactn. prod. with phenyl isocyanate, m.p. 137°) see (5).]

[\bar{C} with 2-methyl butane (isopentane) (1:8500) + AlCl₃ shaken for 2 min. gives (6) 2-chloro-2-methylbutane (ter-amyl chloride) (3:7220).]

Colorless lachrymatory liq. gradually becoming colored in light. — Spar. sol. aq.; eas. sol. alc., ether, CHCl₃. — Volatile with steam. — Note that although two geometrical isomers are possible only this one (configuration uncertain) is known.

[For prepn. of \bar{C} from α,β -dichloro-n-butyraldehyde (3:9102) by elimination of HCl through steam distillation of its soln. in aq. NaOAc (70-80% yield (5)) (4) (1) (2) see indic. refs.; for form. of \bar{C} (together with other prods.) from acetaldehyde (1:0100) with Cl₂ (3), from α,α,β -trichloro-n-butyraldehyde ("butylchloral") (3:5910) with Zn + aq. or Zn + HCl (6), from chloroacetaldehyde (hemihydrate) (3:7212) with acetaldehyde + trace fumg. HCl (7), from α -chloro- β -hydroxy-n-butyraldehyde (α -chloroacetaldol) (itself obtd. from crotonaldehyde (1:0150) by addn. of HOCl (8)) by steam distillation (8) see indic. refs.]

 \bar{C} with Cl_2 (3) (7) (2) in CCl_4 soln. (4) adds 1 mole halogen yielding α,α,β -trichloro-n-butyraldehyde ("butyrchloral") (3:5910). — \bar{C} with Br_2 (1 mole) below 0° rapidly adds 1 mole halogen yielding (5) α -chloro- α,β -dibromo-n-butyraldehyde (not distillable without decompn. even in vac.); this prod., however, slowly combines with aq. yielding corresp. monohydrate, cryst., m.p. 45-50° (5), or on oxidn. with excess fumg. HNO₃ at 100° for several hrs. gives α -chloro- α,β -dibromo-n-butyric acid, colorless pr. from conc. HNO₃, m.p. 91-92° (5).

[\tilde{C} on reduction with Al(OEt)₃ under H₂ (9) or with Zr isopropylate in isopropyl alc. (10) yields β -chlorocrotonyl alc. (2-chlorobuten-2-ol-1) (3:8240), b.p. 159°.]

[\bar{C} with ethylene glycol (1:6465) + a little 20% H₃PO₄ gives (22% yield (1)) the corresp. cyclic acetal (" α -chlorocrotylidene-ethylene glycol"), b.p. 76-80° at 14 mm. (1); for formn. of analogous cyclic acetals from \bar{C} with other glycols see (11).]

[Č with liq. HCN as directed gives (88% yield (4)) the corresp. cyanohydrin, 3-chloro-2-hydroxypenten-3-nitrile, b.p. 137-138° at 26 mm., $D_{\rm A}^{21} = 1.964$, $n_{\rm D}^{21} = 1.4762$ (4).]

 \bar{C} with naphthoquinone-1,4 (1:9040) in C_6H_6 treated with trace of piperidine undergoes condensation of Diels-Alder type yielding {12} 2-chloroanthraquinone (3:4922).

[For conversion of \bar{C} with EtOH to corresponding α -chlorocrotonaldehyde diethylacetal (14), b.p. 181–184°, see (14).]

[C with sodium salt of anthrahydroquinone bis-sulfuric acid ester in $Ac_2O/AcOH +$ piperidine at 100° for ½ hr. yields (13) the corresp. benzanthrone, presumably Bz-2-chloro-Bz-1-methylbenzanthrone (12-chloro-13-methylbenzanthrone) (for ring numbering see Beil. VII₁-(288)).]

[For prepn. of \bar{C} from chloroacetaldehyde (3:7212) on warming with EtOH see (9); from chloroacetaldehyde ethyl alcoholate (chloroacetaldehyde ethyl-hemi-acetal) [Beil. I-611] in EtOH with dry HCl gas see (10); from α,β -dichloroethyl ethyl ether (3:5640) with 2 vols. abs. EtOH (2) or with NaOEt (11) (12) (13) see indic. refs.]

Č is comml. chem. in U.S. (1943) (14); Č is widely used in org. synthesis as source of combined chloroacetaldehyde (3:7212) and otherwise.

The acetal portion of \tilde{C} is stable to alkali but readily hydrolyzed by aq. acids; the chlorine atom, however, behaves like a reactive alkyl halide; all these characteristics are illustrated in the reactns, cited below.

 $\tilde{\mathbf{C}}$ on warming with dil. $\mathbf{H}_2\mathbf{SO}_4$ yields (15) chloroacetaldehyde (3:7212) accompanied by some bis-(β -chloro- α -ethoxyethyl) ether, b.p. abt. 165°; $\tilde{\mathbf{C}}$ on satn. at 100° with dry HCl gas yields (9) $\alpha_i\beta$ -dichloroethyl ethyl ether (3:5640). — $\tilde{\mathbf{C}}$ on htg. with AcOH at 120° or with anhydrous oxalic acid at 100–150° yields (12) chloroacetaldehyde (3:7212) + ethyl acetate (1:3015) or diethyl oxalate (1:1055) respectively.

[\bar{C} htd. with NaOEt in s.t. at 140–150° for 30 hrs. (11) (13) (17) or with abs. alc. NaOEt at 160° under press. (16) gives (66% yield (16)) ethoxyacetaldehyde diethylacetal, b.p. 168° (11) (this prod. on boilg. with dil. H₂SO₄ (17) (13) (16) hydrolyzes to EtOH (1:6130) + ethoxyacetaldehyde (1:0159), b.p. 105–106°). — \bar{C} htd. with 10% excess of satd. abs. alc. KOH in s.t. for 75 hrs. gives (95% yield (18)) glycolaldehyde diethylacetal (hydroxyacetaldehyde diethylacetal) (1:0191), b.p. 167°.] [For reactn. of \bar{C} with many other alcs. (19) (20) and phenols (21) in pres. of alk. see indic. refs.]

[$\bar{\mathbf{C}}$ htd. with Na or Mg at 120–130° (22) or with Na in ether at 0–20° (23) yields ethyl vinyl ether (1:7810), b.p. 35.7°, + EtOH and prob, also ethoxyacetaldehyde diethylacetal (see above). — $\bar{\mathbf{C}}$ on boilg. with Zn dust yields (2) ethyl chloride (3:7015) + EtOH (1:6130). — $\bar{\mathbf{C}}$ with excess phenyl MgBr at 120° as directed (24) gives 31% yield α,β -diphenylethyl ethyl ether (α -ethoxydibenzyl) [Beil. VI₁-(329)].]

[\ddot{C} htd. with 4-5 vols. conc. aq. NH₄OH in s.t. at 130° for 12-14 hrs. (25) or \ddot{C} +20 vols. satd. alc. NH₃ in s.t. at 130° (26) (27) (28) or refluxed in pres. of NaI (29) yields amino-acetaldehyde diethylacetal [Beil. IV-308, IV₁-(449), IV₂-(758)], b.p. 163°. — \ddot{C} htd. with alc. hydrazine hydrate under press. for 6 hrs. at 115-120° yields (30) hydrazinoacetaldehyde diethylacetal [Beil. IV-553].]

[Č with aniline + NaNH₂ in ether gives (77% yield (31)) N-(phenyl)aminoacetalde-

hyde diethylacetal [Beil. XII-213], b.p. 92-94° at 0.3 mm.; for corresp. behavior with benzylamine (32) or primary aliph. amines (33) see indic. refs.] — C with 3 moles phenylhydrazine htd. several hrs. at 130° yields (34) glyoxal-bis-(phenylhydrazone), yel. tbls. from alc. or ether, m.p. 177° u.c., 179° cor. (34).

C on acid hydrolysis (3) yields ethyl alcohol (1:6130) and chloroacetaldehyde (3:7212) q.v.

[For f.p./compn. data on system: $\bar{C}+p$ -chlorotoluene (3:8287) (eutectic, f.p. -50° conts. 73% \bar{C}) see (8) (112); for D_{20}^{20} /compn. data on this system see (8); for n_{D}^{10} /compn. data on this system see (15). — For f.p./compn. data on systems \bar{C} + chlorobenzene (3:7903) (13), $\bar{C}+m$ -dichlorobenzene (3:5960) (16), \bar{C} + bromobenzene (16) see indic. refs.]

[For prepn. of \bar{C} from o-toluidine [Beil. XII-772, XII₁-(372)] via diazotization and use of Cu₂Cl₂ reactn. (yields: 85% (23), 79–90% (21), 74 79% (7), 70% (18)) (19) (20) (22), or Cu powder (66% yield (24)) (25), or mere boilg, with HCl (26), or use of CuH (27), or CaCl₂ (28) see indic. refs.; for prepn. from o-toluenediazonium chloride (solid) [Beil. XVI-495, XVI₁-(358)] with C₆H₆ + AlCl₃ (29), from o-toluenediazonium chloroplatinate on htg. (30), or from o-toluenediazopiperidide by htg. with HCl (31) see indic. refs.; for prepn. of \bar{C} from o-cresol (1:1400) via conv. with PCl₅ at 140° to tris-(o-toloxy)phosphoric acid dichloride and htg. of latter at 180° see (32); for prepn. of \bar{C} from p-toluenesulfonyl chloride via chlorination to 2-chlorotoluenesulfonyl chloride-4 followed by hydrolysis with 10% H₂SO₄ (33) to 2-chlorotoluenesulfonic acid-4 (see below) and subsequent replacement of $-SO_3H$ by H with superheated steam in 80% H₂SO₄ (overall yield 88–90% (33)) cf. (34) (35); for prepn. of \bar{C} from 2-chlorotoluenesulfonic acid-5 (see below) or its sodium salt by steam distn. of its soln. in 75% H₂SO₄ see (8).]

[For prepn. of \bar{C} from toluene with Cl_2 in pres. of Fe (8) (36) (38), or I_2 (37) (39), Fe + I_2 (15), Al/Hg (45), MoCl₅ (36), SbCl₅ (39), or PbCl₂ (8), from toluene via electrolysis of its suspension in boilg. HCl (40) or in HCl/AcOH at 35° (41), from toluene by boilg. with PbCl₂.2NH₄Cl (42), from toluene with SO₂Cl₂ + cat. (43) especially AlCl₃ (43) (44), from toluene with n-butyl chlorosulfonate (46), from toluene with NCl₃ (47) see indic. refs.: no m-chlorotoluene is formed by any of these methods, but the proportion of \bar{C} to its ac-

companying p-isomer (3:8287) varies widely, e.g., from 100% \tilde{C} with PbCl₂ + NH₄OH (42), through 62% o/28% p with PbCl₂ (8), to 2.5 o/1 p via the electrolytic methods (40) (for details the orig. refs. must be consulted).] — [For sepn. of \tilde{C} from polychlorotoluenes via const.-boilg. mixt. with aq. see (79).]

[For prepn. of C from hydrazone of o-chlorobenzaldehyde (3:6410) by Wolff-Kishner reduction (35-82% yield) see [113].]

[For thermal anal. of system: C + SbCl₃ see (48).]

[\overline{C} with H₂ in pres. of Pd/CaCO₃ in alc./alk. soln. loses all its chlorine as HCl (49); \overline{C} with HI + P at 302° for 5 hrs. gives 80% yield (50) toluene (1:7405).]

 \bar{C} on oxidn. with CrO₃ is completely destroyed (30); \bar{C} on oxidn. with boilg. aq. KMnO₄ (74–78% yield (51)) (52) (36) (53) or \bar{C} on cat. oxidn. with air over granular tin vanadate at 287° (13.8% yield (54)) cf. (55) or \bar{C} + KCN + NiCl₂ in dil. alc. 20 hrs. at 260–270° (7.5% yield (63)) gives σ -chlorobenzoic acid (3:4150); \bar{C} with CrO₂Cl₂ followed by aq. (51.5% yield (56)) (57) or \bar{C} on oxidn. with Ce cpds. (58) or with air over Ta₂O₅ (59) cf. (60) or \bar{C} with MnO₂ + H₂SO₄ (61) or PbO₂ + dil. H₂SO₄ (24% yield (62)) gives σ -chlorobenzaldehyde (3:6410).

[\tilde{C} with Cl₂ in pres. of Al/Hg gives (64) a mixt. contg. 2,3- (3:6345), 2,4- (3:6290), 2,6- (3:6270), together with some 2,5-dichlorotoluene (3:6245). — \tilde{C} with Cl₂ + 3% PCl₅ in light gives (65) (19) o-chlorobenzyl chloride (3:6400); \tilde{C} with Cl₂ + PCl₅ at 150-180° (66) (67) (68) cf. (70) gives o-chlorobenzal (di)chloride (3:6625); \tilde{C} with Cl₂ + PCl₃ (73) or with Cl₂ at 160-190° (69) gives (64% yield (69)) (70) (71) o-chlorobenzotrichloride (3:6880).]

[\bar{C} with Br₂ in pres. of Al/Hg in CCl₄ gives (74) mainly 5-bromo-2-chlorotoluene [Beil. V-307, V₁-(155)], together with a smaller amt. of 4-bromo-2-chlorotoluene [Beil. V-307, V₁-(155)]; the former is also obtd. (75) from \bar{C} + Br₂ + HNO₃ + H₂SO₄ in AcOH. — \bar{C} with Br₂ (76) (77) yields o-chlorobenzyl bromide [Beil. V₁-(155)] (for studies of rate of side-chain bromination of \bar{C} see (78)).]

 $[\tilde{C} + I_2 + HNO_3 + H_2SO_4]$ in AcOH gives (75) 2-chloro-5-iodotoluene [Beil. V-315].] $[\tilde{C}$ with AlCl₃ + HCl gas as directed (7) undergoes partial rearr. to both *m*-chlorotoluene (3:8275) and *p*-chlorotoluene (3:8287); for anal. of mixts. of the three isomers see (7).]

[\bar{C} with AcCl (80) or better Ac₂O (81) + AlCl₃ gives (70% yield (81)) 4-chloro-3-methylacetophenone [Beil. VII-307], b.p. 254.2-254.4° at 753.4 mm., $n_D^{25} = 1.5521$ (81). — \bar{C} with β -chloropropionyl chloride (3:5690) + AlCl₃ in CS₂ gives (68% yield (82)) (83) 2-chloro-5-(β -chloropropionyl)toluene, colorless pr. from C₆H₆, m.p. 46° (82), which on ring closure with conc. H₂SO₄ gives (82) (83) 6-chloro-7 (or 5)-methylindanone-1, cryst. from alc., m.p. 74-75° (82) (83). — \bar{C} with trichloroacetonitrile + AlCl₃ (4 moles) at 80-90° satd. with HCl gas for 2 days gives (40% yield (84)) 4-chloro-3-methyl- ω , ω -trichloroacetophenone, b.p. 155-160° at 11 mm. (84). — \bar{C} with fumaryl (di)chloride + AlCl₃ in CS₂ at 50-60° for 2 hrs. gives (51% yield (85)) trans-bis-1,2-(4-chloro-3-methylbenzoyl) ethylene, pale yel. cryst. from alc., m.p. 167° (85).]

[$\ddot{\mathbf{C}}$ with benzoyl chloride + AlCl₃ gives (83% yield (86)) 3-chloro-4-methylbenzophenone [Beil. VII₁-(236)], lfts. from alc., m.p. 82-83° (86); $\ddot{\mathbf{C}}$ with o-chlorobenzoyl chloride (3:6640) + AlCl₃ in CS₂ for 12 hrs. gives (87) 2',3-dichloro-4-methylbenzophenone, cryst. from alc., m.p. 43.5° (87). — $\ddot{\mathbf{C}}$ with naphthalene-bis-1,4(or 5)-(dicarboxylic acid dichloride) + AlCl₃ gives (88) bis-1,4(or 5)(chlorotoluoyl)naphthalene (used for ring closure to corresp. dibenzpyrenequinones).]

[C with phthalic anhydride + AlCl₃ at 90° gives (89) (90) (91) a mixt. (93% yield (90)) of two o-(chlorotoluoyl)benzoic acids A + B: A, m.p. 183-184° (90), 182-183° (91) (89), the main prod., is regarded variously as either (90) o-(3-chloro-4-methylbenzoyl)benzoic acid or (91) o-(4-chloro-3-methylbenzoyl)benzoic acid but in any case with conc. H₂SO₄

ring-closes to give (92% yield (90)) (91) 2-chloro-3-methylanthraquinone, colorless tbls. from toluene, m.p. 219° (91) cor. (90); B, m.p. 176–177° (91), the minor prod., regarded (91) as o-(2-chloro-3-methylbenzoyl)benzoic acid, with conc. H_2SO_4 ring-closes to give 1-chloro-2-methylanthraquinone, yel.-br. ndls. from toluene, m.p. 171° (91), 170–171° (90).] — [For reactn. of \tilde{C} with 3,4-dichlorophthalic anhydride (3:3695) (92) or with pyromellitic anhydride (93) see indic. refs.]

[\tilde{C} with aq. NaOH in pres. of Cu at 350-360° under press. yields (94) a mixt. contg. 41% o-cresol (1:1400) + 59% m-cresol (1:1730) (for extensive study of hydrolysis of \tilde{C} as means of prepn. of m-cresol (1:1730) see (112)); \tilde{C} with NH₃ + cat. under press. as directed (95) (96) (97) yields o-toluidine (for behavior of \tilde{C} with liquid NH₃ see (98)). — \tilde{C} with aniline + Cu at 175° yields (99) phenyl-o-tolylamine. — \tilde{C} with diphenylamine + K at 240-245° in H₂ gives (by rearr.) (100) N,N-diphenyl-m-toluidine, m.p. 69-70°.] — [Note that \tilde{C} does not react with aq. sodium sulfanilate + Na₂CO₃ (dif. from benzyl chloride (3:8535)) and use in sepn. of \tilde{C} from the latter (8).]

[$\bar{\mathbf{C}}$ on mononitration, e.g., with 4 pts. HNO₃ (D=1.52) at 0° (101) gives a mixt. contg. all four possible isomers, viz., 43% 2-chloro-5-nitrotoluene [Beil. V-329, V₁-(163)], m.p. 42.9° (101), 44° (102), 21% 2-chloro-6-nitrotoluene [Beil. V-327, V₁-(162)], m.p. 35.3° (101), 37° (103) (104), 19% 2-chloro-3-nitrotoluene [Beil. V-328, V₁-(163)], m.p. 22.1° (101), 21.5° (105), and 17% 2-chloro-4-nitrotoluene [Beil. V-329, V₁-(163)], m.p. 62.3° (101), 65° (105A).]

 \bar{C} on dinitration, e.g., with mixt. of 3 wt. pts. HNO₃ (D=1.48) + 9 wt. pts. conc. H₂SO₄ at 100° (106), or with 2 vol. pts. HNO₃ (D=1.42) + 5 vols. pts. conc. H₂SO₄ at 100° as directed (107), gives mainly (55–60% (107)) 2-chloro-3,5-dinitrotoluene [Beil. V-345, V₁-(169)], cryst. from alc., m.p. 64° (107), 63–64° (106), accompanied by smaller amts. of three isomers, viz., 2-chloro-4,5-dinitrotoluene, m.p. 88.5° (18–20% (107)), 2-chloro-5,6-dinitrotoluene, m.p. 106.5° (18–20% (107)), and 2-chloro-4,6-dinitrotoluene, m.p. 49° (1-2% (107)) [the two other possible dinitro-2-chlorotoluenes have been prepd. by indirect means, viz., 2-chloro-3,4-dinitrotoluene, m.p. 89° (108), and 2-chloro-3,6-dinitrotoluene, m.p. 62–63° (109)].

[\bar{C} on monosulfonation with fumg. H₂SO₄ (37) or 100% H₂SO₄ (23) (8) or CISO₃H (110) (see below) yields 2-chlorotoluenesulfonic acid-5 [Beil. XI-95]; \bar{C} sulfonates more readily (8) than p-chlorotoluene (3:8287) and may thus be used to separate \bar{C} from the latter (8) (111).]

D 2-Chlorotoluenesulfonamide-5 (4-chloro-3-methylbenzenesulfonamide-1): cryst. from dil. alc., m.p. 126° u.c. (110). [From C with ClSO₃H as directed (110) followed by conv. of the intermediate 2-chlorotoluenesulfonyl chloride-5, cryst. from pet. ether, m.p. 63° u.c. (110), with (NH₄)₂CO₃.]

[For prepn. of \tilde{C} from *m*-toluidine [Beil. XII-853, XII₁-(397)] via diazotization and use of Cu₂Cl₂ reactn. (yields: 86% (46), 80% (11)) (12) (13) or CuH (35% yield (48)) see indic. refs.; from 3-chloro-4-aminotoluene [Beil. XII-989, XII₁-(436)] via diazotization followed by boilg. with alc. (60% yield (14)) or conversion to corresp. hydrazine and subsequent oxidn. with CuSO₄ (50% yield (15)) see indic. refs.; from 5-chloro-2-aminotoluene [Beil. XII-835] with alc. H₂SO₄ + ethyl nitrite (1) or by diazotization, reduction to the corresp. hydrazine, and oxidn. of latter with CuSO₄ (43–63% yield (15)) see indic. refs.: for formn. of \tilde{C} from 1-methylcyclohexanone-3 by conversion with PCl₅ to 3-chloro-1-methylcyclohexane-x, treatment with Br₂, and boilg. with quinoline see (16); from 3-chloro-1-methylcyclohexadiene-1,3 [Beil. V-116] by conv. to dibromide and boilg. with quinoline see (17), from *m*-cresol (1:1730) with PCl₅, or from tri-(*m*-tolyl) phosphate at 210° see (18): for study of formn. of \tilde{C} by partial rearr. with AlCl₃ of o-chlorotoluene (3:8245) or p-chlorotoluene (3:8287) see (2).]

 $[\bar{C} \text{ with } H_2 \text{ in pres. of } Pd/CaCO_3 \text{ in alc./alk. soln. loses all its chlorine as HCl (19); <math>\bar{C} \text{ with } H_2 \text{ in pres. of } Pt \text{ in AcOH loses } HCl, \text{ but no quant. data are given (20).}]$

[C with Cl₂ in pres. of Al/Hg yields (21) both 2,5-dichlorotoluene (3:6245) and 3,4-dichlorotoluene (3:6355) but no trace of any other isomers.]

[$\bar{\mathbb{C}}$ with Br₂ in CCl₄ at 60-80° in bright light (22) (23) or in CS₂ (23) or $\bar{\mathbb{C}}$ at 130° with Br₂ directly (24) gives (55% yield (22)) m-chlorobenzyl bromide, m.p. 15-15.5°, b.p. 103-105° at 8 mm. (22), b.p. 108-111° at 10 mm. (24), $D_{25}^{25} = 1.5652$ (22); $\bar{\mathbb{C}}$ with Br₂ in CCl₄ in pres. of Al/Hg (25) or $\bar{\mathbb{C}}$ with Br₂ in AcOH in pres. of HNO₃ or HNO₃/H₂SO₄ (26) gives both 6-bromo-3-chlorotoluene, b.p. 120-125° at 15 mm. (26), 100-103° at 15 mm. (25) (note disagreement!), and 4-bromo-3-chlorotoluene, b.p. 90-93° at 12 mm. (26).] — [$\bar{\mathbb{C}}$ with Br₂ in pres. of Be yields (27) x,y-dibromo-3-chlorotoluene, m.p. 96.5°.]

[\tilde{C} with AlCl₃ + HCl gas as directed undergoes partial rearr. (2) to both o-chlorotoluene (3:8245) and p-chlorotoluene (3:8287); for anal. of mixtures of the three isomers see (2).]

[Č with $AcCl + AlCl_3$ in CS_2 gives (60% yield (28)) 3-chloro-4-acetyltoluene (2-chloro-4-methylacetophenone), b.p. 260–262° at 760 mm. (28), b.p. 120–126° at 14 mm. (29), accompanied (29) by some of the isomeric 3-chloro-6-acetyltoluene (4-chloro-2-methylacetophenone), b.p. 120–122° at 14 mm. (29). — Č with chloroacetyl chloride (3:5235) + $AlCl_3$ in CS_2 gives (70% yield (33)) 3-chloro-6-(chloroacetyl)toluene (ω,4-dichloro-2-methylacetophenone, m.p. 90° (33). — Č with β-chloropropionyl chloride (3:5690) + $AlCl_3$ in CS_2 gives (87% yield (50)) (30) 3-chloro-6-(β-chloropropionyl)toluene which on ring closure with conc. H_2SO_4 gives (50) (30) 5-chloro-7-methylindanone-1, m.p. 71° (50) (30). — Č with biphenyl-4,4'-bis-(carboxylic acid chloride) + $AlCl_3$ yields (31) 4,4'-bis-(4-chloro-2-methylbenzoyl)-biphenyl (used in prepn. of bis-anthraquinonyl derivs.).]

[Č with trichloroacetonitrile + AlCl₃ as directed (32) yields 4-chloro-2-methylbenzoic acid (3:4700).]

[For study of system: C + SbCl₃ see (7).]

[\bar{C} with NH₃ + cat. as directed (34) (35) yields *m*-toluidine; \bar{C} with aq. NaOH in pres. of Cu at 300-400° under press. yields (51) mixt. of o-cresol (1:1400), *m*-cresol (1:1730), and *p*-cresol (1:1410).]

[\bar{C} on mononitration, e.g., with 4 pts. HNO₃ (D=1.52) at 0°, gives a mixt. contg. (36) cf. (37) (13) (38) 59% 3-chloro-6-nitrotoluene [Beil. V-327, V₁-(162)], m.p. 24.9°, + 32% 3-chloro-4-nitrotoluene [Beil. V-329, V₁-(163)], m.p. 24.2°, + 9% 3-chloro-2-nitrotoluene [Beil. V-327, V₁-(162)], m.p. 23.4°. — \bar{C} on dinitration, e.g., with mixt. of 2 wt. pts. HNO₃ (D=1.52) + 3 wt. pts. conc. H₂SO₄ at room temp. for 12–18 hrs. (13), gives (95.8% yield (13)) 3-chloro-4,6-dinitrotoluene [Beil. V-344, V₁-(168)], cryst. from alc. or lgr., m.p. 91° (13) (38) (39), 90–90.5° (52) (note that the isomeric 3-chloro-2,6-dinitrotoluene [Beil. V₁-(168)] (40), m.p. 77° (40), and 3-chloro-2,4-dinitrotoluene, m.p. 92° (41), are also known but prepd. by indirect means). — \bar{C} on trinitration, e.g., by refluxing with 3 pts. HNO₃ (49.4°Bé) + 3 pts. H₂SO₄ (66°Bé) at 160° (42), yields 3-chloro-2,4,6-trinitrotoluene [Beil. V-349], cryst. from C₆H₆ + lgr., m.p. 150–151° (52), 148.5° (42).]

[\bar{C} with Na followed by CO₂ as directed gives (yields: 88% (43A), 58% (43B)) *m*-toluic acid (1:0705), m.p. 110-111°, also obtd. in small yield (44) from \bar{C} + alc. KCN in pres. of NiCl₂, htd. in s.t. at 260-270° for 20 hrs.]

[\bar{C} with CrO_2Cl_2 gives a cpd. which with aq. gives (44.5% yield (45)) *m*-chlorobenzaldehyde (3:6475).]

 \tilde{C} on oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (14), with 5% aq. KMnO₄ (11) (46) or with dil. HNO₃ in s.t. at 130-140° for 10 hrs. (15) gives (75% yield (46)) *m*-chlorobenzoic acid (3:4392).

Colorless oil with agreeable odor; undergoes partial decompn. on distn. at ord. press. — Very sol. aq. but not miscible with it.

[For prepn. of \bar{C} from propanediol-1,3 (trimethylene glycol) (1:6490) with HCl gas (50-60% yield (8)) (4) (7) (11) (12) (13) (1), with conc. HCl (yield: 34% (14), 28% (15), 15% (16)) (some 1,3-dichloropropane and other prods. are also formed), with SOCl₂ (50-60% yield (77)), or with S_2Cl_2 (yields: 68% (5), 60% (16)) (17) see indic. refs.; for formn. of \bar{C} from γ -chloro-n-propyl acetate (see below) by alcoholysis with MeOH/HCl (85% yield (18)) or from γ -chloro-n-propyl trichloroacetate (9) by hydrol. with aq. KOH at 35° (9) see indic. refs.; for manuf. from ethylene + formaldehyde + HCl + ZnCl₂ see (19).]

 \bar{C} on oxidn. with conc. HNO₃ gives (yields: 78-79% (20), 54-56% (21), 30-40% (13)) β -chloropropionic acid (3:0460) (note that the presumably intermediate β -chloropropionaldehyde (3:5576) is best obtd. by other means).

[\bar{C} with HBr gas (22), on distn. with 48% HBr (yield: 75–85% (22), 40% (11)), with HBr + H₂SO₄ (yield: 89% (23)), or with PBr₃ (94% yield (11)) gives 1-bromo-3-chloropropane (trimethylene chlorobromide) [Beil. I-109, I₁-(36), I₂-(75)], b.p. 142–145°, D_{25}^{25} = 1.4718 (24), n_{25}^{25} = 1.4732 (24); for study of rate of reactn. of \bar{C} with HBr in phenol see (25).]

[\bar{C} refluxed with $\frac{1}{2}$ wt. conc. H₂SO₄ gives (10–15% yield (26)) bis-(γ -chloro-n-propyl) ether, b.p. 215° at 745 mm., $D_{20}^{20} = 1.140$ (26). — \bar{C} with SO₂Cl₂ gives (68% yield (27)) γ -chloro-n-propyl chlorosulfonate, b.p. 85° at 4 mm., $D_{20}^{02} = 1.456$ (27). — \bar{C} with SOCl₂ gives (70% yield (27)) sym.-bis-(γ -chloro-n-propyl) sulfite, b.p. 161–162° at 13 mm., $D_{10}^{10} = 1.313$ (27).]

[$\bar{\mathbf{C}}$ with COCl₂ (3:5000) directly (28) or in toluene (29) gives (43% yield (29)) γ -chloro-n-propyl chloroformate (3:6895); $\bar{\mathbf{C}}$ with trichloroacetic acid (3:1150) gives (57% yield (9)) γ -chloro-n-propyl trichloroacetate, b.p. 107° at 8 mm., $D_4^{15} = 1.4732$, $n_D^{15} = 1.4830$ (9); for formn, of other esters (as derivs.) see below.]

[Other reactns. involving only the OH group of \tilde{C} include the following: \tilde{C} with acetylene + BF₃ + HgO gives (38% yield (30)) ethylidene bis-(γ -chloro-n-propyl)acetal, b.p. 127-129° at 14 mm. (30); \tilde{C} with benzonitrile + HCl gas in ether gives (31) γ -chloro-n-propyl iminobenzoate hydrochloride; \tilde{C} with β -acetobromglucose + Ag₂CO₃ yields (32) tetra-acetyl- β -d-(γ -chloro-n-propyl)glucoside, m.p. 74° (for extension to prepn. of corresp. xyloside, galactoside, and lactoside see (32)).]

[Č with solid KOH loses HCl on htg. giving (16) (7) (10) (1) 1,3-epoxypropane (trimethylene oxide) [Beil. XVII-6, XVII₁-(3)], b.p. 47.8° at 760 mm., $D_4^{25} = 0.8930$, $n_D^{24} = 1.3897$ (16) (for study of rate of reactn. see (33)).]

[\bar{C} with NaOEt in abs. alc. reacts vigorously giving (38% yield (34)) ethyl γ -hydroxy-n-propyl ether (trimethylene glycol monoethyl ether) [Beil. I-476, I₁-(247)], b.p. 160-161° (34), 162.1-162.2°, $D_4^{20} = 0.91691$, $n_D^{20} = 1.41666$ (35), accompanied by some trimethylene glycol diethyl ether, b.p. 140° (34). — \bar{C} with NaSH as directed gives (70-80% yield (34)) γ -hydroxy-n-propyl mercaptan, b.p. 85-90° at 15 mm. (Hg mercaptide = Hg (SCH₂CH₂-CH₂OH)₂, pl. from butanol, m.p. 132-134° (36). — \bar{C} with aq. Na₂S gives (36) bis-(γ -hydroxy-n-propyl) sulfide, visc. oil which could be neither distd. nor crystd. but which with phenyl isocyanate gave the corresp. bis-(phenylcarbamate), m.p. 146-148° (36). — \bar{C} with NaSCH₃ in ether gives (76% yield (42)) γ -hydroxy-n-propyl methyl sulfide, b.p. 105-105.5° at 30 mm. (42). — \bar{C} with benzyl mercaptan in alc. gives (88% yield (43)) benzyl γ -hydroxy-n-propyl sulfide, b.p. 185° at 19 mm. (43).]

[\bar{C} in alk. medium reacts with phenols yielding corresp. subst. alcohols; e.g., \bar{C} with phenol + alc. NaOEt (75% yield (37)) or \bar{C} + phenol + aq. NaOH (80% yield (38) (39)) gives 3-phenoxypropanol-1, b.p. 158-160° at 25 mm., $n_D^{2D} = 1.491$ (37) which with ZnCl₂ at 215° loses aq. and ring-closes (37) to chromane [Beil. XVII-52, XVII₁-(22)]; for corresp. reactn. with o-cresol (40), with m-cresol (41), p-cresol (41), β -naphthol (40), or resorcinol (40) see indic. refs.]

[$\bar{\mathbf{C}}$ with prim. or sec. amines splits out HCl yielding corresp. subst. aminoalcohols: e.g., for reactn. of $\bar{\mathbf{C}}$ with aniline + anhydrous Na₂CO₃ giving (67.5% yield) 3-(N-phenylamino)propanol-1 (N-(γ-hydroxy-n-propyl)aniline), b.p. 192° at 30 mm., $D_{20}^{20} = 1.063$, $n_{20}^{20} = 1.502$, see (44); for analogous reactn. of $\bar{\mathbf{C}}$ with p-toluidine see (45); for $\bar{\mathbf{C}}$ with actetrahydro-β-naphthylamine see (46); for $\bar{\mathbf{C}}$ with various sym. aliphatic sec. amines see (47) (55); for $\bar{\mathbf{C}}$ with morpholine giving (75% yield) 3-(morpholino)propanol-1, b.p. 147–149° at 21 mm., $n_{20}^{20} = 1.4743$, $n_{20}^{20} = 1.4762$, see (76); for $\bar{\mathbf{C}}$ with piperidine see (48) (56).] — [$\bar{\mathbf{C}}$ with ter-amines yields corresp. quat. ammon. salts: e.g., $\bar{\mathbf{C}}$ with (CH₃)₃N in C₆H₆ in s.t. at 100° for 8 hrs. gives (92% yield (49)) γ-homocholine chloride, m.p. 173° (49); $\bar{\mathbf{C}}$ with pyridine gives (85% yield (50)) γ-hydroxy-n-propyl pyridinium chloride, oil.] — [For reactn. of $\bar{\mathbf{C}}$ with arsanlic acid (p-aminobenzenearsonic acid) (51), with p-hydroxy-benzenearsonic acid (52), with ethyl β-methylaminopropionate (53), or with various carbazole derivs. (54) see indic. refs.]

[Č with 1 mole thiourea htd. at 120–125° yields (57) S-(γ -hydroxy-n-propyl)isothiourea hydrochloride, cryst. from butanol, m.p. 130° (57); Č with dry sodium p-toluenesulfonamide htd. at 160–170° for 18 hrs. yields (58) N-(γ -hydroxy-n-propyl)-p-toluenesulfonamide as an oil.]

[For study of rate of reactn. of \bar{C} with KI in acetone at 35° and 45° see (39); for reactn. of \bar{C} with Na₃AsO₃ see (5).]

⁻⁻⁻⁻ γ-Chloro-n-propyl acetate [Beil. II₁-(48), II₂-(139)]: liq., b.p. 168-169° (59), 165-166° (60), 88-90° at 22 mm. (61), 66° at 14 mm. (17), 62-63° at 10 mm. (7) $D_{21}^{21} = 1.1105$ (7); $n_D^{21} = 1.431$ (7). [From \ddot{C} + AcCl (yields: 90% (60), 87% (16)) (7) (62), from 1,3-dichloropropane (3:5450) with AgOAc (53% yield (61)), or from

- trimethylene glycol (1:6490) with $Ao_2O + S_2Cl_2$ (68% yield (17)).]—[This acetate with solid KOH loses HOAc giving (16) (7) (61) 2,3-epoxypropane (trimethylene oxide) (see above).]
- —— γ -Chloro-n-propyl benzoate: oil, b.p. 154-156° at 22 mm. (31), 155-156° at 15 mm. (4), 133-134° at 2 mm. (39), $D_4^{22} = 1.1672$ (31), $n_D^{20} = 1.5136$ (31). [From $\ddot{\mathbf{C}}$ + BzCl (yields: 84% (39), 75% (4)) or from γ -chloro-n-propyl iminobenzoate hydrochloride (see above) by hydrol. (31).] [For reactn. of this ester with pyrrolidine (63), pyrroline (63), piperidine (56), subst. piperidines (64) (65) (68), hydrogenated quinolines (66), or with N-methyl-phenyl-alkylamines (67) see indic. refs.]
- —— γ -Chloro-n-propyl p-nitrobenzoate: oil, b.p. 168.5–169.5° at 2 mm., $D_{25}^{25} = 1.3222$, $n_{D}^{25} = 1.54736$ (67). [From $\tilde{C} + p$ -nitrobenzoyl chloride on htg. (67).]
- \bigcirc γ -Chloro-n-propyl 3,5-dinitrobenzoate: colorless pl. from lt. pet., m.p. 77° (17). [From $\bar{C} + 3,5$ -dinitrobenzoyl chloride (17).]
- γ-Chloro-n-propyl hydrogen phthalate: unreported.
- ---- γ-Chloro-n-propyl hydrogen 3-nitrophthalate: unreported.
 - —— γ-Chloro-n-propyl benzenesulfonate: unreported.
- ---- γ-Chloro-n-propyl p-toluenesulfonate: oil, b.p. $216-219^{\circ}$ at 17 mm. (69), $188-192^{\circ}$ at 5 mm. (24), $D_4^{20} = 1.2674$ (69), $D_2^{25} = 1.2396$ (24), $D_D^{20} = 1.5230$ (69), $D_D^{21} = 1.5225$ (24). [From $\bar{C} + p$ -toluenesulfonyl chloride on htg. (69) or with aq. NaOH at 15° (50-55% yield (24)).]—[For reactn. of this ester with RMgX cpds. see (69) (24), with various sodium acetylenes see (70).]
- γ-Chloro-n-propyl carbamate: pearly cryst. from hot. aq., m.p. 62° (29). [From C with urea nitrate (2 moles) on htg. at 130-135° (16% yield (29)) or from γ-chloro-n-propyl chloroformate (3:6010) with conc. aq. NH₄OH (29).]
- —— γ-Chloro-n-propyl N-(phenyl)carbamate: ndls. from alc., m.p. 38° (29), m.p. 35-36° (28), b.p. 190° at 3.5 mm. (28). [From C̄ + phenyl isocyanate at 150° (29) or from γ-chloro-n-propyl chloroformate (3:6010) with aniline (29).]
- \bigcirc γ -Chloro-n-propyl N-(α -naphthyl)carbamate. cryst. from hot lgr., m.p. 76° (71) (17), 76.5° (9), 75.5–76.5° (28). [From $\ddot{C} + \alpha$ -naphthyl isocyanate (71).]
- ① $N-(\gamma-Hydroxy-n-propyl)$ phthalimide [3-(N-phthalimido)propanol-1] [Beil. XXI-472]: cryst. from aq., m.p. 75°-(72), 74° (73), 88° (74). [From \bar{C} + K phthalimide at 190° (73); also indirectly as cited in other indicated refs.]
- N-(γ-Hydroxy-n-propyl)tetrachlorophthalimide [3-(N-tetrachlorophthalimido)propanol-1)]: pr. from acetone, m.p. 165–166° (75). [From C with K tetrachlorophthalimide as directed (75).]

See also Note 1.

Note 1. For further data on b.p. of C at 16 pressures from 74-764 mm. see (4).

Note 2. For effect of press. on m.p. see (20).

Note 3. For data on D_4^t from $t = 25^\circ$ to $t = 160^\circ$ see (16) (4); note also $D_{20}^{20} = 1.0714$ (8).

Note 4. For $n_{\rm D}^{19}/{\rm compn}$. data on system: $\bar{\rm C}$ + o-chlorotoluene (3:8245) see (22).

 \bar{C} with aq. forms a const.-boilg. mixt., b.p. 95° (use in sepn. of \bar{C} from polychlorotoluenes (23)). — For f.p./compn. data on system: \bar{C} + o-chlorotoluene (3:8245) (eutectic, f.p. -49.8°, contg. 27 wt. % \bar{C}) see (8) (147); for D_{20}^{20} /compn. data (8) and for n_{D}^{10} /compn. data (22) on this system see indic. refs. — For f.p./compn. data on systems of \bar{C} with p-bromotoluene or with p-fluorotoluene see (19). — For data on const.-boilg. mixts. of \bar{C} with various org. cpds. see Beil. V₂-(227). — For cryoscopic constant (i.e., lowering of f.p. per mole solute per 1000 g. \bar{C}) viz., 5.53 (12), 5.6 (24), 5.97 (25), see indic. refs.; for use in detn. of \bar{C} in mixt. with o-chlorotoluene (3:8245) and m-chlorotoluene (3:8275) see (25).

[For prepn. of \bar{C} from p-toludine via diazotization in HCl and warming the resultant solution as such (yields: 60% (26), 40-44% (27)) (28) or in pres. of Cu₂Cl₂ (yields: 95% (33), 88-89% (29), 81% (31), 70-79% (30), 63.5% (32)) [for study of kinetics of this reaction see (34) (35)], or in pres. of Cu powder (63.8% yield (36)), or in pres. of CuH (64% yield (37)), or by electrolysis between Cu electrodes in pres. of CuCl₂ (38) see indic. refs.; for prepn. of \bar{C} from p-toluidine via diazotization, conversion to solid p-toluenediazonium chloride, and subsequent warming with C_6H_6 + AlCl₃ (39), or via diazotization, conversion of diazonium salt to its cpd. with PbCl₄, and subsequent htg. of latter in naphthalene at 150° (40), see indic. refs.]

[For formn. of \tilde{C} (usually together with other prods.) from toluene (1:7405) with Cl₂ (70) in pres. of Fe in diffuse light in cold (8) (gives mixt. contg. 42% \tilde{C} + 58% o-chlorotoluene (3:8245) (8) (22)), or in pres. of I₂ (22) (41) (42), or in pres. of PbCl₂ (8), SbCl₅ (41), MoCl₅ (43) (28) (44), or Al/Hg (45); for formn. of \tilde{C} from toluene by electrolysis in strong HCl (46) or in AcOH/conc. HCl in dark (47) see indic. refs.; for formn. of \tilde{C} from toluene with SO₂Cl₂ at 160° (48), with SO₂Cl₂ in pres. of various cat. in dark (49), with SO₂Cl₂ + AlCl₃ + S₂Cl₂ at 70° (50), with pyrosulfuryl chloride + AlCl₃ at 0° (51), with HCl + HNO₃ at 100° (52), with n-butyl chlorosulfonate + AlCl₃ (6.2% yield (53)), with anhydrous FeCl₃ after refluxing 1½ hrs. (65% yield (54)), or with NCl₃ (55) see indic. refs.]

[For formn. of \tilde{C} from o-chlorotoluene (3:8245) or m-chlorotoluene (3:8275) by partial rearr. with AlCl₃ + HCl gas see (25); from tetra-(p-tolyl)tin with Cl₂ in CHCl₃ (85% yield (6)) or from tri-(p-tolyl) stibine dichloride on htg. under 5-7 mm. press. at 60-65° (56) (note that at 160-200° di-p-tolylstibine chloride is formed (56)) or from tri-(p-tolyl)-phosphite dichloride by htg. at 200-210° (57) see indic. refs.; from p-tolyl MgBr in ether with Cl₂ (58) or with benzenesulfonyl chloride (59) see indic. refs.; from p-toluenediazopiperidide with conc. HCl see (60); from p-chlorobenzaldehyde (3:0765) on elec. reduction in acid soln. with Cu cathode see (61); from chlorobenzene (3:7903) via condensation with CH₂O + HCl to p-chlorobenzyl chloride (3:0220) and subsequent reductn. with Zn + NaOH see (62).]

[Č on pyrolysis over red-hot Pt yields (63) mainly 4,4'-dichlorodibenzyl (1,2-bis-(p-chlorophenyl)ethane [Beil. V-600, V_1 -(281), V_2 -(507)], colorless lfts. from alc., m.p. 112°, accompanied by a very small amt. 4,4'-dichlorostilbene (1,2-bis-(p-chlorophenyl)ethylene) [Beil. V_1 -(304), V_2 -(539)], ndls. from alc., m.p. 170°.]

[\bar{C} with H₂ in pres. of Pd/CaCO₃ (64) or reduced Ni (65) in alc./alk. soln. loses all its halogen as HCl; \bar{C} with Na in liq. NH₃ as directed (66) yields toluene and other prods.; \bar{C} with HI + P in s.t. at 302° for 5 hrs. gives (80% yield (67)) toluene.]

 $\bar{\mathbb{C}}$ on oxidn. with 3 pts. KMnO₄ in dil. aq. soln. under reflux for 4–5 hrs. (68) (51), or with CrO₃ (42), or with dil. HNO₃, e.g., with 6 pts. of dil. HNO₃ (1 vol. conc. HNO₃ + 2 vols. aq.) at 145° for 1½ hrs. (69) or at 115–120° for 5–6 hrs. (70), yields p-chlorobenzoic acid (3:4940), m.p. 243° (for use in quant. estn. of $\bar{\mathbb{C}}$ in pres. of toluene, benzyl chloride, and o-chlorotoluene see (70)). — Note that with HNO₃ $\bar{\mathbb{C}}$ is more rapidly oxidized than o-chlorotoluene, m-chlorotoluene, or the various dichlorotoluenes but more slowly than p-bromotoluene (69). — $\bar{\mathbb{C}}$ on oxidn. with air at 260° in pres. of Na₂CO₃ and under press. (71), or on vapor-phase oxidn. over suitable cat. (72), or on electrolytic oxidn. in dil. Na₂CO₃ soln. at 60° (73) cf. (74), or even on very long stdg. (2 years) with $\bar{\mathbb{I}}_2$ + aq. in sunlight (75) gives p-chlorobenzoic acid. — $\bar{\mathbb{C}}$ with N₂O₄ yields (76) p-chlorobenzoic acid accompanied by nitration prods.

[\bar{C} with chromyl chloride (CrO₂Cl₂) yields an addn. prod. which with aq. gives in good yield (77) p-chlorobenzaldehyde (3:0765). — \bar{C} with air in aq. susp. of FeO.OH + cat. at 235-240° and 50-60 atm. press. gives (78) a mixt. of p-chlorobenzaldehyde (3:0765) + p-chlorobenzoic acid (3:4940).]

[$\bar{\mathbb{C}}$ with Cl₂ or on htg. with PbCl₄.2NH₄Cl or with SO₂Cl₂ in pres. of dibenzoyl peroxide in dark yields p-chlorobenzyl chloride (3:0220), q.v. for relevant refs. — $\bar{\mathbb{C}}$ with 2 moles Cl₂ in pres. of 5% PCl₅ at 160–170° gives (79) (80) p-chlorobenzal (di)chloride (3:6700). — $\bar{\mathbb{C}}$ with 3 moles Cl₂ at high temp. in u.v. light (81) cf. (82) or with 3 moles Cl₂ (83) in pres. of FeCl₃ (84) or of PCl₅ (85) (86) gives (93% yield (85)) p-chlorobenzotrichloride (3:6825) q.v. — $\bar{\mathbb{C}}$ with Cl₂ (1 mole) in pres. of 1% Fe or 40% PbCl₂ at 20° gives (65% yield (87)) a mixt. comprising 58.4% 2,4-dichlorotoluene (3:6290) + 41.6% 3,4-dichlorotoluene (3:6355).]

[\bar{C} with Br₂ at 130° (88) or at 160° (89) (90) or in pres. of dibenzoyl peroxide in dark at 100° (91) gives (21% yield (90)) exclusively (91) p-chlorobenzyl bromide [Beil. V-307, V₂-(239)], cryst. from MeOH, m.p. 62-63° (88), ndls. from 85% alc., m.p. 50° (90), 51° (79), 48.5° (89); for study of rate of side-chain bromination of \bar{C} in CS₂ at 57° see (92). — \bar{C} with 2 moles Br₂ in pres. of BeBr₂ (93) or in AcOH + fumg. HNO₃ + fumg. H₂SO₄ (94) gives p-chlorobenzal (di)bromide, m.p. 99° (93).]

[C with AlCl₃ + HCl gas as directed (25) undergoes partial rearr. to both o-chlorotoluene (3:8245) and m-chlorotoluene (3:8275); for anal. of mixts. of the three isomers see (25).]

[\bar{C} with AcCl (95) or better Ac₂O (96) (97) + AlCl₃ in CS₂ (98) gives (yields: 85% in 4 hrs. (97), 65% (98), 34% in 2 hrs. (96)) 2-chloro-5-methylacetophenone [Beil. VII-307], b.p. 245.8-246.0° at 760.1 mm. (96), $n_2^{25} = 1.5419$ (96). — \bar{C} with β -chloropropionyl chloride (3:5690) + AlCl₃ in CS₂ gives (87% yield (99)) (100) 4-chloro-3-(β -chloropropionyl)toluene, oil, which on ring closure with conc. H₂SO₄ gives (72% yield (99)) (100) 7-chloro-4-methylindanone-1, cryst. from MeOH, m.p. 128° (99) (100). — \bar{C} with trichloroacetonitrile + AlCl₃ (4 moles) at 80-90° satd. with HCl gas for 2 days gives only 5% yield (101) of a mixt. of 2-chloro-5-methyl- and 5-chloro-2-methyl- ω , ω , ω -trichloroacetophenones.]

[Č with oxalyl (di)chloride (3:5060) + AlCl₃ in CS₂ for 20 hrs. at room temp. gives (40% yield (102)) 2-chloro-5-methylbenzoic acid (6-chloro-3-methylbenzoic acid) (3:4615), cryst. from aq., m.p. 163-166° (102), accompanied by some dichlorodimethyl-benzophenone, m.p. 70°, whose structure was not detd. — Č with fumaryl (di)chloride (3:5875) + AlCl₃

in CS₂ at 50-60° for 2 hrs. gives (25% yield {103}) bis-1,2-(2-chloro-5-methylbenzoyl)-ethylene, pale yel. cryst. from alc., m.p. 158° (103).]

[$\ddot{\mathbf{C}}$ with benzoyl chloride + AlCl₃ in CS₂ gives (50% yield (98)) (104) (105) 2-chloro-5-methylbenzophenone (6-chloro-3-methylbenzophenone) [Beil. VII₁-(235)], cryst. from AcOH, m.p. 35–36° (98) (104) (105), together with 5-chloro-2-methyl-(3-chloro-6-methyl)-benzophenone [Beil. VII₁-(235)], oil, b.p. 210° at 30 mm. (106). — $\ddot{\mathbf{C}}$ with o-chlorobenzoyl chloride (3:6640) + AlCl₃ in CS₂ gives (106) 5,2'-dichloro-2-methylbenzophenone [Beil. VII₁-(235)], oil, b.p. 225° at 12 mm. (106).]

[C with phthalic anhydride (1:0725) + AlCl₃ gives (62.5% yield on the phthalic anhydride (107)) o-(2-chloro-5-methylbenzoyl) benzoic acid, ndls. from C₆H₆, m.p. 164-165° (107), 165° (108), which with conc. H₂SO₄ at 75° for 4 hrs. (108) or with 8 pts. fumg. H₂SO₄ (20% SO₃) (107) ring-closes to give (yields: 93% (107), 85% (108)) 1-chloro-4-methylanthraquinone [Beil. VII-809, VII₁-(421)], yel. ndls. from AcOH or alc., m.p. 164° (107) (108). — Note that the structure of the above keto acid, m.p. 164-165°, has been definitely established (109) as shown and that it is not the isomeric o-(5-chloro-2-methylbenzoyl)-benzoic acid, which appears to be still unreported. — For reactn. of C with 3,6-dichloro-phthalic anhydride (3:4860) (110) or with pyromellitic anhydride (111) in pres. of AlCl₃ see indic. refs.]

[\bar{C} does not (112) react with bis-(chloromethyl) ether (3:5245), but \bar{C} with formalin + conc. HCl yields (62) 4-chloro-3-(chloromethyl)toluene since on reductn. with Zn + NaOH the prod. gives 4-chloro-1,3-dimethylbenzene (3:8665). — \bar{C} with aq. vapor + CO over suitable cat. at 300-400° yields (113) p-toluic acid (1:0795). — \bar{C} with NH₃ + CO over suitable cat. as directed (114) yields p-toluidine (see also below). — \bar{C} with S₂Cl₂ + AlCl₃ in CS₂ gives (115) 4,5-dichloro-1,8-dimethylthianthrene, m.p. 195-197° (115).]

[\bar{C} with Li in ether gives (63% yield (116)) p-tolyllithium; \bar{C} with Li at 150° followed by treatment with aq. gives (117) toluene + 4,4'-dimethylbiphenyl. — \bar{C} with Na in C₆H₆ treated with CO₂ at ord. temp. (118) (119) or at 50° and 500 lbs. press. (120) cf. (121) gives (yields: 95% (120), 76% (121)) p-toluic acid (1:0795), m.p. 178°. — \bar{C} with Na treated with benzophenone as directed (122) yields diphenyl-p-tolyl-carbinol [Beil. VI-722, VI₁-(355)], m.p. 72-73°.]

[C on hydrolysis with aq. vapor over silica gel contg. 3% finely divided Ni at 380° (123), or with aq. vapor over cat. at 480° (124), or with aq. Na₂CO₃ in pres. of Cu at 300° under press. (125), or with 15–20% aq. NaOH at 300° (126) gives (80% yield (123)) p-cresol (1:1410). Note, however, claim (127) that C when hydrolyzed with 15% aq. NaOH in pres. of Cu for 2 hrs. at 315–320° yields prod. contg. not only p-cresol (1:1410) but also m-cresol (1:1730) (for extensive study of hydrolysis of C as means of prepn. of m-cresol see (147)). — C with H₂S at 700° over suitable cat. yields (128) thio-p-cresol (p-tolyl-mercaptan).]

[C with aq. NH₄OH + CuO at 150-250° under press. (129) or C + aq. NH₄OH + Cu salts + various anti acids at 225-230° under press. (130) (131) yields p-toluidine and/or di-p-tolylamine. — C with KNH₂ in liq. NH₃ (132) or Na in liq. NH₃ (66) yields p toluidine. — Note that C does not react with aq. sodium sulfanilate + Na₂CO₃ (dif. from benzyl chloride (3:8535) and use in sepn. of C from latter (8)).]

[\bar{C} on mononitration yields a mixt. contg. both 4-chloro-2-nitrotoluene [Beil. V-327, V₁-(162), V₂-(251)], m.p. 38.2° (133), 37-38° (10), 37° (29) (22), b.p. 239.5-240° at 718 mm. (134), 115.5° at 11 mm. (22) (easily volatile with steam, but not reacting with piperidine even after 8 hrs. at 100° (10)), and 4-chloro-3-nitrotoluene [Beil. V-329, V₂-(252)], m.p. 7° (135), 5.8° (133), b.p. 260° at 745 mm. (135), 118° at 11 mm. (22) (reacts readily with piperidine at 100° (10)); e.g., \bar{C} added in 2 equal portions to 3 wt. pts. HNO₃ (D = 1.5) at 0° gives 88% yield of mixt. contg. 58.8% 4-chloro-2-nitrotoluene + 41.2% 4-chloro-3-

nitrotoluene (10). — For further studies of mononitration of \bar{C} with HNO₃ + H₂SO₄ or with HNO₃ + Ac₂O + P₂O₅ see (29) (136), for influence of temperature (at -15° proportion of 4-chloro-2-nitrotoluene is slightly increased) see (10) (133).]

 \bar{C} on direct dinitration, e.g., with 3 wt. pts. fumg. HNO₃ (D=1.47), gives (134) a prod. now regarded (137) as 4-chloro-2,6-dinitrotoluene [Beil. V-344], yel. ndls. from ether, m.p. 76° (134), 76–77° (137). — [The three other possible dinitro-4-chlorotoluenes are now all known but have been prepd. indirectly; viz., 4-chloro-2,3-dinitrotoluene, lemon-yel. pr. from C₆H₆ + {lt. pet., m.p. 106.5° (138); 4-chloro-2,5-dinitrotoluene [Beil. V-344, V₁-(168), V₂-(263)], yel. pr. from lgr., m.p. 107°; and 4-chloro-3,5-dinitrotoluene [Beil. V-345, V₁-(169), V₂-(264)], pale yel. ndls. from alc., m.p. 115–116° (139), 116° (140).]

[C on monosulfonation, e.g., by htg. with 3 pts. 100% H₂SO₄ at 100° (141) (142) cf. (143) (28), yields mainly 4-chlorotoluenesulfonic acid-2 [Beil. XI-88] (corresp. sulfonyl chloride (144), m.p. 24° (142), see also below; corresp. sulfonamide, m.p. 145° (144), 142° (142), see also below; corresp. sulfonamilide, m.p. 144° (142)), accompanied by some 4-chlorotoluenesulfonic acid-3 [Beil. XI-95] (corresp. sulfonyl chloride, m.p. 56° (142), corresp. sulfonamide, m.p. 156° (142), corresp. sulfonamilide, m.p. 188° (142)). — C sulfonates much less readily than the isomeric o-chlorotoluene (3:8245); for use of this means of separation of C from the latter see (8) (145).]

◆ 4-Chlorotoluenesulfonamide-2 (5-chloro-2-methylbenzenesulfonamide-1): cryst. from dil. alc., m.p. 142-143° u.c. (146). [From C with ClSO₃H in CHCl₃ as directed (146) followed by conversion of the intermediate 4-chlorotoluenesulfonyl chloride-2 cryst. from pet. ether, m.p. 21°, to the sulfonamide with (NH₄)₂CO₃ or NH₄OH (146).]

155-156° (5) $n_D^{17.7} = 1.45423$ (3)
154-157° (6) $D_4^{17.7} = 1.0920$ (11)

[See also ethyl β -chlorocrotonate (3:8538).]

Note the lack of accord regarding the b.p. of \bar{C} especially at ordinary pressures; this is presumably attributable to more or less contamination with the stereoisomeric ester (3:8538).

[For prepn. of \tilde{C} from β -chloroisocrotonic acid (3:1300) in EtOH with dry HCl gas (yields: 100% (4), 65% (12)) (2) (5) or a little conc. H₂SO₄ (yield 65% (6)) (8) (11) see indic. refs.]

[For prepn. of \bar{C} from ethyl acetoacetate (1:1710) with PCl_5 in C_6H_6 followed by refluxing with a little I_2 see {13} (1); note, however, that this method has subsequently (6) been regarded as unsatisfactory for the prepn. of pure \bar{C} although it suffices to give (40–50% yields (14)) a mixt. of \bar{C} with its stereoisomer (3:8538) which for many purposes is adequate.]

[\bar{C} (2 moles) with K₂S (1½ moles) in 5 vols. abs. EtOH refluxed for 5 hrs. (note that the stereoisomer (3:8538) requires 16) gives (53% yield (14)) diethyl β , β -thiodicrotonate, S(—C(CH₃)=CH.COOC₂H₅)₂, b.p. 150-153° at 4 mm. (14), accompanied by some ethyl β -mercaptocrotonate (see below).]

 $[\bar{C}]$ with alc. NaSH as directed gives (55-60% yield crude prod. (15)) ethyl β -mercaptocrotonate; note that this prod. is apparently a mixt. of the two geom. stereoisomeric thioenols together with the keto form, viz., ethyl thioacetoacetate, CH₃.CS.CH₂.COOC₂H₅; for details see (15); note also that ethyl β -chlorocrotonate (3:8538) by the same treatment gives the same result so that a mixt. of the esters can be employed as initial material.]

 $[\bar{C}]$ with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl β -substituted crotonates: e.g., \bar{C} with NaOEt in ether gives (5) ethyl β -ethoxycrotonate [Beil. III-373, III₁-(135), III₂-(254)], m.p. 29.5° (5); \bar{C} with Na allylate gives (6) ethyl β -allyloxycrotonate; \bar{C} with Na cinnamylate gives (6) ethyl β -cinnamyloxycrotonate; \bar{C} with Na phenolate gives (16) ethyl β -phenoxycrotonate, b.p. 152° at 18 mm. (16); note that in the three preceding cases either \bar{C} or its stereoisomer (3:8538) yields the same result.]

[Č with Na salt of ethyl mercaptan gives (12) ethyl β -ethylmercaptoisocrotonate, b.p. 127–129° at 16 mm. (12); Č with Na salt of benzyl mercaptan gives (75% yield (12)) a mixt. of ethyl β -benzylmercaptocrotonate, m.p. 64.5° (12), and ethyl β -benzylmercaptoisocrotonate (consts. not given).]

[Č with diethyl sodiomalonate gives (9) cf. (17) cis diethyl α-carbethoxy-β-methylglutaconate, (C₂H₅OOC)₂CH.C(CH₃)=CH.COOC₂H₅ [Beil. II-853], b.p. 164-165° at 12 mm.,

 $D_4^{20} = 1.0884$, $n_D^{20} = 1.4579$ (9); cf. behavior of stereoisomeric ethyl β -chlorocrotonate (3:8538).

 $\ddot{\mathbf{C}}$ with hydrazine hydrate in abs. alc. splits out HCl and EtOH with consequent ring closure yielding (18) 5-methylpyrazolone-3 [Beil. XXIV-19, XXIV₁-(189)], m.p. 215° (18); note that same prod. is also obtd. from methyl β -chloroisocrotonate (3:8028).

Č (1 mole) with phenylhydrazine (1 mole) at 100° for 6–8 hrs. gives by ring closure mainly (4) 3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-20, XXIV₁-(190)], pr. from aq., m.p. 127°, accompanied by small amts. of 4-benzeneazo-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV₁-(319)], m.p. 155–156°, and 3,3'-dimethyl-1,1'-diphenyl-bis pyrazolone-5,5' [Beil. XXVI-484], dec. at high temp. without melting. — Note that with excess phenylhydrazine (2–4 moles) only traces of the 3-methyl-1-phenylpyrazolone-5 are formed while the amt. of the other two (less desirable) prods. is greatly increased (4).

3:8510 1-CHLORO-4-ETHYLHEXENE-3
$$C_8H_{15}Cl$$
 Beil. I — Cl $CH_2.CH_3$ I_1 — I_2 —(201) $CH_2.CH_2.CH_3$ I_2 —(201) B.P. 173° (1) $D_2^{40} = 0.9102$ (1) $n_D^{20} = 1.4524$ (1)

[For prepn. of $\tilde{\mathbf{C}}$ from 6-chlorohexanone-3 (γ -chloro-n-propyl ethyl ketone) [Beil. I₁-(355), I₂-(747)] with excess EtMgBr see (1).] $\tilde{\mathbf{C}}$ adds Br₂.

3:8519 (1) De Boosere, Bull. soc. chim. Belg. 32, 35-39 (1923).

Colorless strongly refractive liquid rapidly decomposed in strong light (7).—Č is stronger lachrymator than BzCl (2).

[For prepn. of \bar{C} from furoic acid (1:0475) with PCl₅ (poor yields (3) (4) (6)), with excess PCl₅ in dry CHCl₃ as specified (100% yield (6)) (8), with PCl₅ (77% yield (5)), with SOCl₂ (100% (2), 79% (1), 60% (3)), with SOCl₂ in C₆H₆ (89.5% yield (7)), or with phosgene (9) see indic. refs.

[$\bar{\mathbf{C}}$ with MeOH yields methyl furoate (1:3452), b.p. 180.5° at 750 mm., 76° at 20 mm., $D_4^{20}=1.1792,~n_D^{20}=1.4875$ (10); $\bar{\mathbf{C}}$ with EtOH yields ethyl furoate (1:2082), b.p. 197°, m.p. 34°; $\bar{\mathbf{C}}$ with furfuryl alc. (1:6425) yields (11) furfuryl furoate, dimorphous cryst., m.p. 27.5° and 19 5°, b.p. 122° at 2 mm. (11); for study of reactn. of $\bar{\mathbf{C}}$ with cellulose see (12).]

[C with phenol yields (2) phenyl furoate, m.p. 41 5° (2).]

[\tilde{C} with C_6H_6 + AlCl₃ yields (13) (14) α -furyl phenyl ketone [Beil. XVII-348; XVII₁-(186)], b.p. 282-284°; \tilde{C} with toluene + AlCl₃ gives (80% yield (15)) α -furyl p-tolyl ketone, m.p. 41-42°, b.p. 180-183° at 23 mm. (15).]

[For study of reactn. of C with Cl₂ (16) or Br₂ (17) see indic. refs.]

Č with pyridine in ether or Č with Na or Ag furoate yields (18) furoic anhydride, ndls. from alc., m.p. 73° (18).

 \bar{C} on hydrolysis (rate of reactn. even with boilg. aq. slower than BzCl (6)) yields furoic acid (1:0475), m.p. 133-134° (for the amide, anilide, p-toluidide, and other derivatives corresp. to \bar{C} see 1:0475).

Colorless liq. with penetrating odor; vapor of \bar{C} is irritating to eyes. — Insol. aq., volatile with steam. — Insol. cold conc. H_2SO_4 , but soon reacts evolving HCl. \bar{C} dissolves below -20° in equal vol. pet. ether (35).

Binary systems containing \bar{C} . \bar{C} + toluene: for b.p. and vapor press. relations see (36). - \bar{C} + anisole: for f.p./composition data see (25). - \bar{C} + N-methylaniline: for f.p./composition data see (25).

 \bar{C} with benzaldehyde (1:0195) forms a const.-boilg. mixt., b.p. 177.9° at 760 mm., contg. 50 wt. % \bar{C} (37-a). — \bar{C} with n-butyric acid (1:1035) forms a const.-boilg. mixt., b.p. 160.8° at 760 mm., contg. 35 wt. % \bar{C} (38). — \bar{C} with isobutyric acid (1:1030) forms a const.-boilg. mixt., b.p. 153.5° at 760 mm., contg. 20 wt. % \bar{C} (38). — \bar{C} with n-caproic acid (1:1130) forms a const.-boilg. mixt., b.p. 179.0° at 760 mm., contg. 97 wt. % \bar{C} (38).

 \bar{C} with chloroacetic acid (3:1370) forms a const.-boilg. mixt., b.p. 172° at 760 mm., contg. 72 wt. % \bar{C} (38-b). — \bar{C} with " α -dichlorohydrin" (1,3-dichloropropanol-2) (3:5985) forms a const.-boilg. mixt., b.p. 168.9° at 760 mm., contg. 43 wt. % (2)

PREPARATION OF C

From benzene. The prepn. of \bar{C} from benzene (1:7400) by direct introduction of the —CH₂Cl group (chloromethylation) has been much studied especially in recent years. Chloromethylation may be effected with paraformaldehyde (1:0080), formalin (1:0145), chloromethyl methyl ether (3:7085), or bis-(chloromethyl) ether (3:5245), each in the pres. of ZnCl₂ and frequently also of HCl gas. For a general review of the process of chloromethylation see (39) and subsequent articles (32) (40) (41). Various by-products of the reaction are formed, notably ω, ω' -dichloro-p-xylene (3:2825) and diphenylmethane (1:7120). For study of further chloromethylation of \bar{C} to various poly-(chloromethyl)-benzenes see (41).

[For prepn. of \bar{C} from C_6H_6 (1:7400) by chloromethylation with paraformaldehyde (1:0080) + $ZnCl_2$ + HCl (yields: 80% (42), 73.5% (40), 70% (32), 36% (42)) (39), with formalin (1:0145) + $ZnCl_2$ + HCl (yields: 70.5% (40), 57% (44)) (45) (39) (48), or with chloromethyl methyl ether (3:7085) (40) (43) (46) (47) or bis-(chloromethyl) ether (3:5245) (40) (43) see indic. refs.]

From toluene. [For prepn. of C from toluene (1:7405) by chlorination with SO₂Cl₂ in pres. of dibenzoyl peroxide (75-80% yield (15)), with SO₂Cl₂ (for study of effect of catalysts see (83) (84)) below 130° (49) (50), with SO₂Cl₂ in pres. of acetyl chloride (51), with Cl₂ (52) (53) (for study of catalysts see (85)) in vapor phase (54) (55) (61) in light (56) (57) (58) (59) (60) (62), with Cl₂ in pres. of Pb + PCl₃ (63), with NOCl at 150° (64) or 350° (65), with NCl₃ (66), or with ter-butyl hypochlorite (3:7165) (62% yield (67)) see indic. refs.]

From benzyl alcohol. [For prepn. of \bar{C} from benzyl alcohol (1:6480) with HCl gas (68), with conc. aq. HCl at 60° (70–100% yield (69)) (70) in C_6H_6 (study of kinetics at 60° (71)), with conc. HCl + ZnCl₂ in cold (100% yield (72)), with PCl₃ + ZnCl₂ (60% yield (72)), with SOCl₂ (100% yield (73)) in C_6H_6 (85% yield (72)) or in N,N-dimethylaniline (26% yield (72)), or with AlCl₃ in pet. eth. above 40° (74) see indic. refs.]

From other miscellaneous sources. [For formn. of \bar{C} from benzyl chloroformate (3:9565) on htg. (75) (76), from benzyl benzoate (1:4422) with 5 moles SO_2Cl_2 (77), from dibenzyl ether (1:7640) or other benzyl ethers with PCl_5 (78), from dibenzyl disulfide with excess SO_2Cl_2 in C_6H_6 at 37-39° (79), from benzylamine with NOCl in ether at -15° (80) or with aqua regia (81), or from tetrabenzylhydrazine with conc. HCl on htg. (82) see indic. refs.]

CHEMICAL BEHAVIOR OF C

Determination of C. Many methods for detn. of C have been employed and no complete listing can be given here; the following examples, however, may be helpful. [For detn. of C by boilg, with alc. AgNO₃ and weighing pptd. AgCl see (85) cf. (83); for detn. of C in

C₆H₆ by addn. of excess standard AgNO₃ in isopropyl alc., htg. several hrs., and excess AgNO₃ titrated with standard aq. NaCl see (71); for methods of detn. of C in pres. of benzal (di)chloride (3:6327) or benzatichloride (3:6540) see (86) (87).]

Pyrolysis of C. [C on boiling (34) (88) gradually dec. with evoln. of HCl. — C over glowing Pt wire gives (89) (90) much stilbene (1:7250) accompanied (91) by small amounts of toluene (1:7405) and dibenzyl (1:7149).]

Resinification of \tilde{C} . \tilde{C} under the influence of various catalysts condenses with itself evolving HCl and yielding a material of composition $(C_7H_6)_n$; this material is often (though incorrectly) designated as polymeric \tilde{C} . Because of the indefinite character of the product and the voluminous and diffuse character of the literature, no exhaustive review will here be attempted. However, for extensive reviews of this reaction see (92) (93); for studies of catalysts for this type of reaction see also (94) (95) (96) (97).

Reduction of \bar{C} . $[\bar{C}$ with H_2 in pres. of Pd/BaCO₃ (98) or Ni (99) in alc. KOH loses all its halogen as HCl (use in quant. detn.), but the corresp. org. reduction prod. has not been characterized. — \bar{C} with H_2 in pres. of colloidal Pd in alc. gives (76% yield (100)) toluene (1:7405). — \bar{C} with EtOH + Zn dust on boilg. gives (101) cf. (102) toluene (1:7405) + benzyl ethyl ether (1:7530). — \bar{C} in EtOH/KOH with hydrazine hydrate in pres. of Pd boiled for 1 hr. gives (29% yield (103)) dibenzyl (1:7149); note that in conc. soln. only traces of dibenzyl are formed (103) cf. (104) and the principal prod. is N_1N_2 -dibenzyl-hydrazine [Beil. XV-533, XV₁-(164)] accompanied by some benzyl ethyl ether (1:7530).]

Oxidation of C. C upon oxidn. yields either benzoic acid or benzaldehyde according to circumstances.

[\bar{C} with air at 160° over Ni cat. (105), with O₂ in u.v. light (106), or with CrO₃/H₂SO₄ at 95–98° for 1½ hrs. (note that β -chloroethylbenzene (3:8712) is stable under these conditions (1071) cf. (53), gives benzoic acid (1:0715). — \bar{C} with conc. aq. alk. at 250–280° and at 300–500 lb./sq. in. press. gives (80–90% yield (108)) benzoic acid (1:0715).]

[Č with equimolal amt. SeO₂ refluxed without solv. for 3 hrs. (109), with CrO₂Cl₂ followed by aq. (110), with hot very dil. HNO₃ (111) (112), with hot 14% aq. Pb(NO₃)₂ (111), with boilg. aq. Ca(NO₃)₂ (112), with boilg. aq. Na₂Cr₂O₇ + Na₂CO₃ (113), with boilg. aq. or alc. hexamethylenetetramine (114) (115), with air at 160° over Ni cat. (105), or with steam + air at 360–480° over V₂O₅ on pumice (116) (117) gives benzaldehyde (1:0195); naturally any over-oxidn. gives also some benzoic acid (1:0715).]

[Note that auto-ignition temp. of C on Pt in air at ord. press. is 627° (118).]

Substitution of \bar{C} . Chlorination. [\bar{C} with NOCl at 150° gives (64) benzal (di)chloride (3:6327). — \bar{C} with aq. PbCl₄.2NH₄Cl on boilg. gives (119) benzal (di)chloride (3:6327) + benzotrichloride (3:6540). — \bar{C} with Cl₂ in pres. of I₂ at 30–40° gives (120) cf. (121) both o-chlorobenzyl chloride (3:6400) and p-chlorobenzyl chloride (3:0220). — Note that \bar{C} with Cl₂ in sunlight (122) undergoes both substitution and addition and that only isolatable prod. was benzal (di)chloride hexachloride, m.p. 153°.]

Bromination. [\bar{C} with Br₂ at 100° gives (123) cf. (124) a mixt. of benzyl bromide, benzal chlorobromide, and benzal (di) bromide. — \bar{C} with Br₂ + BeBr₂ in ether gives (125) p-bromobenzyl bromide. — \bar{C} with Br₂ in pres. of I₂ gives (126) (127) a mixt. of p-bromobenzyl bromide and p-bromobenzyl chloride.]

Sulfonation. [Presumably because of facile hydrolysis or resinification of \tilde{C} with conc. H_2SO_4 , its direct sulfonation has not been reported. However, p-sulfobenzyl chloride (ω -chlorotoluene-p-sulfonic acid) [Beil. XI₁-(30)] has been prepd. (e.g., (128) (129)) from sodium salt of p-toluenesulfonic acid by chlorination.]

Nitration. \bar{C} on mononitration gives a mixt. of o-nitrobenzyl chloride [Beil. V-327, V₁-(162), V₂-(252)], m.p. 49-50° (130), 49.5° (17), 48-48.5° (131), 48-49° (132), 47.9° (133) (143), m-nitrobenzyl chloride [Beil. V-329, V₁-(163), V₂-(252)], m.p. 45-46° (130),

45.5° (17) (131) (134), 44.9° (143), 44.8° (133), and p-nitrobenzyl chloride [Beil. V-329, V₁-(163), V₂-(253)], cryst. from alc., m.p. 72.5° (17) (131) (134), 72.4° (133), 71-72° (130), 71.95° (143), 71° (53). — [For earlier studies of this mononitration of \bar{C} see (53) (135) (136) (137) (138) (139) and especially (140). — Subsequent studies of this mononitration with conc. HNO₃ in acetic anhydride gives (133) 40.9% o-, 4.2% m-, and 54.9% p-nitrobenzyl chlorides (cf. (141) (142) (144)). — For thermal anal. of various mixtures of these three nitrobenzyl chlorides see (133) (143). — For study of rate of nitration of \bar{C} in nitrobenzene soln. at 16-18° see (145). Note that p-nitrobenzyl chloride is a useful reagent for characterization of organic acids by conversion to the corresp. p-nitrobenzyl esters (146) (147); for transformation of p-nitrobenzyl chloride to p-nitrobenzyl bromide in alc. NaBr see (147) cf. (148).]

[Direct polynitration of \bar{C} has not been reported; however, p-nitrobenzyl chloride on further nitration with HNO_3/H_2SO_4 as directed (149) (150) gives 2,4-dinitrobenzyl chloride [Beil. V-344, V₂-(263)], tbls. from ether, m.p. 34° (150), 33-34° (149). — No other dinitrobenzyl chlorides and no trinitrobenzyl chlorides have been reported.]

Hydrolysis of C. C on hydrolysis by various means gives benzyl alcohol (1:6480) and HCl.

[\bar{C} with aq. on protracted boilg. (151) (86) in sunlight (154), with steam + cat. at 550–850° (155) cf. (156), with boilg. aq. K_2CO_3 (157) or alk.-earth carbonates at elev. temps. (158) (159), with hot aq. suspension of PbO (111), with boilg. aq. Na_2CO_3 , NaOH, or their mixt. (160) (161), or with anhydrous formic acid (162) gives benzyl alcohol (1:6480).— For studies on kinetics of hydrolysis of \bar{C} in aq. (163) (169), in 95% EtOH at 30° and 40° (164) (165), in 50% acetone at 60° (166) cf. (167) (168) (170) (17), in dioxane (22), or in formic acid (170) see indic. refs.]

BEHAVIOR OF C WITH OTHER INORGANIC REACTANTS

With alkali sulfhydrates. [\bar{C} with alc. KSH (171) (172) or aq. NaSH (173) (174) (175) gives (75% yield (172)) benzyl mercaptan [Beil. VI-453, VI₁-(224), VI₂-(427)], b.p. 194-195° (171), 99° at 32 mm. (176), 75.8-76.2° at 10 mm. (11), $D_4^{25} = 0.8097$ (176), $n_D^{25} = 1.5729$ (176) (corresp. benzoate, m.p. 30° (177), 3,5-dinitrobenzoate, m.p. 119-120° (177), reaction prod. with 3-nitrophthalic anhydride, m.p. 136-137° (177), 2,4-dinitrophenyl thioether, m.p. 182.5° cor. (185)). Note that benzyl mercaptan with isotopic sulfur has been prepared (178) from \bar{C} via conversion to RMgCl and reaction with S³⁴.]

With alkali sulfides. [\bar{C} with alc. K_2S (171) or alc. Na_2S (179) gives (83% yield (179)) dibenzyl sulfide [Beil. VI-455, VI₁-(225), VI₂-(429)], tbls. from ether, CHCl₃, or alc., m.p. 49-50° (180), 49° (171) (179) (181) (corresp. sulfoxide [Beil. VI-456, VI₁-(226), VI₂-(429)], m.p. 135° (182), 133-134.6° (183), 132-133° (179); corresp. sulfone [Beil. VI-456, VI₁-(226), VI₂-(430)], m.p. 151° (184), 149.5-151° (183), 149.5-150° (179)).]

With alkali polysulfides. [\bar{C} with alc. Na₂S.9H₂O + S (186) (189) in C₆H₆ (187) cf. (188) gives dibenzyl disulfide [Beil. VI-465, VI₁-(229), VI₂-(437)], m.p. 74° (189), 72° (190), 71-72° (191), 70° (186) (corresp. disulfoxide [Beil. VI-466, VI₁-(230), VI₂-(438)], m.p. 108° (190) (192) cf. (209) (201) (210)).]

With salts of various sulfur acids. $[\bar{C}$ with conc. aq. K_2SO_3 (194) cf. (196) or Na_2SO_3 (195) in aq. alc. at 37° (197) (for study of rate at 40° see (16)) or at 190–200° under press. (98% yield (198)), or \bar{C} with aq. $Na_2SO_3/NaOH$ on boilg. (80% yield (199)) (192), gives corresp. salt of toluene- α -sulfonic acid (benzylsulfonic acid) [Beil. XI-116, XI₁-(32)]; for dimorphism of Na salt see (200) (corresp. sulfonyl chloride, m.p. 92–93° (201) (202), 92° (203); corresp. amide, m.p. 105° (203) (192), 104–105° (199), 102° (204); corresp. methyl ester, m.p. 61–62° (205)).]

[\bar{C} with Na₂S₂O₃ on boilg. in aq. alc. (206) or aq. (207) gives salt of S-benzylthiosulfuric acid [Beil. VI-439, VI₁-(230)] (corresp. quaternary salt, viz., benzyl-dimethyl-phenyl-ammonium S-benzylthiosulfate, from metathesis of benzyl-dimethyl-phenyl-ammonium chloride with sodium S-benzylthiosulfate, has m.p. 104° (208)).]

With salts of other inorganic acids. [\bar{C} with NaI in acetone (211) (212) or abs. MeOH (213), or \bar{C} with KI in acetone (214) or EtOH (215), gives (90% yield (211)) benzyl iodide [Beil. V-314, V₁-(157), V₂-(241)], m.p. 24° (211) (212), 27-30° (213), b.p. 97-98° at 11 mm. (216), 93° at 10 mm. (214). — For study of rate of reaction of \bar{C} with KI in acetone at 25° (19) (20), 30° (19), and 50° (19), or with NaI or LiI in acetone at 25° or 30° (19), see indic. refs.]

[Č with powdered AgNO₃ in dry ether 20 hrs. in cold, then at 70–75° for 5 hrs., gives (84% yield (219)) (220) benzyl nitrate [Beil. VI-439], explosive liquid, b.p. 106° at 20 mm. (219), 100–101° at 18 mm. (21), 43° at 0.5 mm. (220). — For study of kinetics of reaction of C with solid AgNO₃ (221) in pres. of inert diluents such as dry ether, CHCl₃, and CCl₄ (222) see indic. refs.; for study of kinetics of reaction of C with Hg(NO₃)₂ in aq. dioxane see (21).]

[Č with AgNO₂ (223) (224) (231) or better mercurous nitrate (225) gives ω -nitrotoluene (phenylnitromethane) [Beil. V-325, V₁-(161), V₂-(249)], b.p. 225-227° dec. (226) (227) cf. (228), 141-142° sl. dec. at 35 mm. (226), 135° at 25 mm. (229), 118-119° at 16 mm. (230), 110° at 8 mm. (231), 90-92° at 3 mm. (232); $D_1^{24.7} = 1.1540$ (233), $D_0^{20} = 1.1598$ (226); $n_{\rm He}^{24.7} = 1.5285$ (233), $n_{\rm D}^{20} = 1.5323$ (226); note, however, that phenylnitromethane is best prepd. in a different way, viz., from benzyl cyanide with methyl nitrate and alc./NaOEt (50-55% yield (232)). — Note that the isomeric benzyl nitrite [Beil. VI-439], unstable oil, b.p. 80-81° at 35 mm. (234), has been reported from benzyl alcohol (1:6480) with aq. NaNO₂ + H₂SO₄ (234).]

[Č with NaN₃ in alc. refluxed 6 hrs. gives (90% yield (234)) ω -azidotoluene (benzyl azide) [Beil. V-350, V₁-(174), V₂-(274)], oil, insol. aq. and volatile with either steam or ether, b.p. 108° at 23 mm. (235), 82.5° at 16.5 mm. (234), 74° cor. at 11 mm. (236); $D_{-}^{24.9} = 1.0655$ (237); $n_{D}^{24.9} = 1.53414$ (237).]

[For behavior of C with metallic evanides see below under organic acids.]

With ammonia. C with ammonia under various circumstances (see below) gives one (or more) of the following amines.

Benzylamine [Beil. XII-1013, XII₁-(445)], liq. with faint characteristic odor, misc. with aq. alc. ether: b.p. 184.5° cor. at 760 mm. (238), 184-186° cor. at 745 mm. (239), 184° at 767 mm. (240), 182° at 749 mm. (226), 181.5-182° at 740 mm. (241), 90° at 12 mm. (242); $D_4^{25} = 0.9812$ (243), $D_4^{20} = 0.9822$ (244); $n_D^{20} = 1.54015$ (226), $n_D^{10.5} = 1.54406$ (244) (corresp. B.HCl, m.p. 255.5-258° (245), 255-256° rap. htg. (226), 253° (246); B.PkOH, m.p. 195-199° (247), 194° (248); B.3,5-dinitrobenzoic acid, m.p. 210.0° cor. (249); B.2,4-dinitrobenzoic acid, m.p. 199.1-200.1° cor. (513); B.p-toluenesulfonic acid, m.p. 180.5-181.5° u.c. (250), 180° (251)). — Dibenzylamine [Beil. XII-1035, XII₁-(453)], oil, insol. aq., eas. sol. alc., ether; b.p. >300° dec. (252), 268-271° cor. at 250 mm. (238), 218-220° at 60 mm. (253), 215° \pm 1° at 39 mm. (254), 186° at 19 mm. (255), 172° at 14 mm. (256); f.p. -25.6° (254); $D_4^{25} = 1.024$ (255), 1.019 (257); $D_4^{21.6} = 1.0256$ (244); $n_D^{21.6} = 1.57432$ (244) (corresp. B.HCl, m.p. 256° (252), 255.5° (258); B.p-toluenesulfonic acid, m.p. 155.5-156.5° u.c. (250)). — Tribenzylamine [Beil. XII-1038, XII₁-(454)], solid, m.p. 92° (259) (260), 91° (256) (261) (262); b.p. 218-222° at 14 mm. (256), 230° at 13 mm. (259) (corresp. B.HCl, m.p. 227-228° (263), 221° (261); B.p-toluenesulfonic acid, m.p. 200.0-202.5° u.c. (250)).

[For formn. of mixts. of benzylamine, dibenzylamine, and tribenzylamine (properties given in preceding paragraph) from reaction of C with aq. NH₄OH at 80° for 8 days (264) or at 125° and 8 atm. press. (265) in pres. of cat. (266); from reaction of C with alc. NH₃ on

stdg. several days (268) (269) (270) or in s.t. at 100° (256) (267), with NH₃ in conc. aq. phenol in s.t. at 100° for 18 hrs. (271), with liq. NH₃ for 24 hrs. (256), or with 5 moles aq. (NH₄)₂CO₃ for 5-6 hrs. at 85-110° (160) see indic. refs.]

[For formn. of benzylamine from reaction of \tilde{C} with K phthalimide at 170–180° followed by hydrolysis of the N-benzylphthalimide (see below under \mathfrak{D} 's) with fumg. HCl at 200° for 2 hrs. (272) cf. (273) (274), with silver cyanate followed by hydrolysis with alkali (275) (276) cf. (268) (277), with acetamide followed by hydrolysis with alc. KOH (278), or with hexamethylenetetramine followed by hydrolysis with alc. HCl (279) see indic. refs.]

[For formn. of tribenzylamine from reaction of C with NaNH₂ at 120° for 24 hrs. see (261) (280).]

With hydroxylamine. [\bar{C} with NH₂OH.HCl + Na₂CO₃ in aq. alc. under reflux gives (281) (282) (283) (284) N,N-dibenzylhydroxylamine [Beil. XV-19, XV₁-(9)], m.p. 124° (284), 123-124° (285), 123° (281); note that the isomeric O,N-dibenzylhydroxylamine [Beil. XV-21], oil, b.p. 145-146° at 3 mm. (286), is obtd. indirectly. — \bar{C} with acetone oxime refluxed in 75% AcOH gives (287) (as the hydrochloride) N-benzylhydroxylamine [Beil. XV-17, XV₁-(8)], m.p. 57° (288), 56-58° (289) (\bar{B} .HCl, m.p. 110° (288)). — Various other benzylated hydroxylamines cannot be discussed here.]

With hydrazine. [\bar{C} with alc. 50% hydrazine hydrate under reflux gives (290) N,N-dibenzylhydrazine [Beil. XV-533, XV₁-(164)], m.p. 65° (\bar{B} .HCl, m.p. 202° (292), 200° (290)); note that the isomeric N,N'-dibenzylhydrazine [Beil. XV-534, XV₁-(166)], m.p. 47° (291) (\bar{B} .HCl, m.p. 225° (293)), is prepd. indirectly. — Various other benzylated hydrazines cannot be discussed here.]

With metals. Sodium. [\bar{C} with Na at 30° on stdg. gives (294) encrustation of NaCH₂-C₆H₅ [Beil. XVI₁-(589)]; the solid is wine red within 5 hrs., red-violet in 12 hrs., blue-violet in 36 hrs., and finally blue-black; and the sodium benzyl can be isolated as a blue-violet solid stable in air (294). — \bar{C} with Na at 100° (295) in a mixt. of C₆H₆ and toluene (296) or in toluene (297) gives dibenzyl (1:7149). — \bar{C} with Na in liq. NH₃ loses its halogen quantitatively (298) giving (50% yield (299)) dibenzyl (1:7149) accompanied by toluene and other products. — For study of free benzyl radical from \bar{C} with Na vapor in helium see (302).]

[\bar{C} with Cu powder in s.t. at 150-160° for 12 hrs. (300), or \bar{C} with Al powder (pretreated with H₂ at 500°) refluxed at 200° for 1 hr. (301), gives (60% yield (301)) dibenzyl (1:7149).] *Magnesium*. [\bar{C} as vapor passed over htd. Mg gives (303) magnesium allylide which with aq. yields methylacetylene ("allylene").]

[Č with Mg in dry ether gives (304) (305) (306) C₆H₅.CH₂MgCl: for study of optimum conditions (311) giving yields of 94.28% (307), 93.2% (308), 91.0-94.1% (309), 90.7-91.2% (310) see indic. refs.; for study of effect of nature of Mg (312), of use of ether/hydrocarbon mixts. as solvent (313), of stability toward long boilg. in ether or ether/benzene (314) see indic. refs.; for further examples of practical prepn. of C₆H₅.CH₂MgCl see (315) (316).—Note that some dibenzyl (1:7149) (e.g., 9.4% (317)) and di-p-tolyl (4,4'-dimethylbiphenyl) (318) are also formed and the yield of dibenzyl is greatly increased in pres. of cat. such as CuCl₂, HgBr₂, FeCl₃, FeBr₃ (319), or MoCl₅ (320).]

An exhaustive treatment of the behavior of C₆H₅.CH₂MgCl (hereafter called RMgCl) is far beyond the scope of this book, but the following examples will be useful and will serve as lead references; for further examples see Beil. XVI-939, XVI₁-(554) and subsequent literature.

[RMgCl with O_2 gives (80% yield (321)) cf. (322) benzyl alcohol (1:6480). — RMgCl (1 mole) gives (84% yield (323)) (324) (325) $C_6H_5CH_2HgCl$, m.p. 104° (323) (324) (326), but excess RMgCl with HgCl₂ gives (326) (325) (327) dibenzyl mercury, m.p. 111° (326). — RMgCl with SbCl₃ gives (328) tribenzylstilbene, m.p. 107-108°. — RMgCl with ClNH₂

gives (yields: 92% (329), 85% (212)) benzylamine (for constants see above under behavior of \bar{C} with NH₃) as hydrochloride; RMgCl with BrNH₂ gives (63% yield (330)) benzylamine. — RMgCl with NCl₃ gives (331) both benzylamine (32% yield) and dibenzylamine (7% yield). — RMgCl with SiF₄ gives (336) (C₆H₅.CH₂)₃SiF, m.p. 79°, accompanied by some (C₆H₅.CH₂)₄Si, m.p. 127.5°; the latter is also obtd. (20.7% yield (337)) from RMgCl with Na₂SiF₆.]

1166

RMgCl with organic reactants frequently (but not invariably) leads to products derived from o-tolyl MgCl and/or p-tolyl MgCl: for reviews on and studies of this rearr. of RMgCl see (332) (333) (334) (335). — RMgCl shows little if any tendency to act as a reducing agent in Grignard additions; for review of reducing action of many Grignard reagents (including C₆H₅.CH₂MgCl) see (338).

[RMgCl with CO at 120° under press. gives (60% yield (339)) 1,3-diphenylpropene-1 [Beil. V-643, V₁-(310), V₂-(552)]. — RMgCl with CO₂ gives (yields: 75-76% (310), 62.7% (335), 60% (340), 51% (318), 40% (333)) phenylacetic acid (1:0665).]

[RMgCl with trioxymethylene gives (50-55% yield (341)) (342) (343) o-tolylcarbinol (1:5922) (note rearr.), but RMgCl with acetaldehyde (as paraldehyde) gives (343) (335) the expected benzyl-methyl-carbinol [Beil. VI-503, VI₁-(251), VI₂-(472)]. — RMgCl with benzaldehyde gives according to conditions various prods. including benzyl-phenyl-carbinol (1:5958) (78% yield (344)) (345) (346), stilbene (1:7250) (25-35% yield (316)), and other products.]

[RMgBr with acetone gives (347) (343) benzyl-dimethyl-carbinol (1:5910). — RMgCl gives with diphenylketone (85% yield (349)) (348) benzyl-diphenyl-carbinol [Beil. VI-721, VI₁-(354), VI₂-(696)] easily dehydrated to (54–59% overall yield (316)) α,α,β -triphenyl-ethylene [Beil. V-722, V₁-(355), V₂-(630)].]

[RMgCl with ClCH₂OCH₃ (3:7085) according to circumstances gives either or both the "normal" prod. (350) (351) methyl β -phenylethyl ether [Beil. VI-479, VI₁-(238), VI₂-(449)] and the "abnormal" prod. (352) (353) methyl o-tolylcarbinyl ether [Beil. VI-484]. — RMgCl with ClCH₂O.CH₂CH₃ (3:7195) according to circumstances gives either or both the "normal" prod. (354) ethyl β -phenylethyl ether [Beil. VI₁-(450)] or the "abnormal" products (352) (332) ethyl o-tolyl ether [Beil. VI-484] and ethyl p-tolyl ether [Beil. VI-498].]

[RMgCl with methyl chloroformate (3:5075) gives some "abnormal" prod. (333).—RMgCl with ethyl chloroformate (3:7295) gives not only the "normal" tribenzylcarbinol [Beil. VI-723, VI₁-(356)] (355) and ethyl phenylacetate (1:3872) but also "abnormal" products (332) (333).]

[RMgCl with acetyl chloride (3:7065) gives (yields: 24% (333), 18% (335)) (332) the "abnormal" product, methyl o-tolyl ketone (o-methylacetophenone) (1:5224). — RMgCl with benzoyl chloride (3:6240) gives (333) the "abnormal" product, phenyl o-tolyl ketone [Beil. VII-439, VII₁-(234)].]

[RMgCl with benzenesulfonyl chloride gives (356) (357) benzyl phenyl sulfone [Beil. VI-455, VI₂-(428)] (2.9% yield (356)) cf. (357) and \bar{C} (60% yield (356)).]

RMgCl with alkyl p-toluenesulfonates gives hydrocarbons. — [E.g., RMgCl with methyl p-toluenesulfonate gives (40.9% yield (358)) ethylbenzene (1:7410), with ethyl p-toluenesulfonate (358) or diethyl sulfate (359) gives (yields: 100% (359), 38.3% (358)) n-propylbenzene (1:7450), with n-propyl p-toluenesulfonate gives (35.6% yield (358)) n-butylbenzene (1:7515), with n-butyl p-toluenesulfonate gives (yields: 67% (361), 50-59% (360), 24.6% (358)) n-amylbenzene (1:7549). — RMgCl with γ -chloro-n-propyl p-toluenesulfonate gives (42-50% yield (362)) ω -chloro-n-butylbenzene (δ -phenyl-n-butyl chloride) [Beil. V₁-(201), V₂-(317)].]

BEHAVIOR OF C WITH ORGANIC REACTANTS

With hydrocarbons. \bar{C} with benzene (1:7400) in pres. of widely varied condensing agts. gives diphenylmethane (1:7120), frequently accompanied by o-dibenzylbenzene [Beil. V-710, V₁-(351), V₂-(621)], m.p. 78-79°, and by p-dibenzylbenzene [Beil. V-711, V₁-(351), V₂-(621)], m.p. 86°. — [E.g., \bar{C} with benzene (1:7400) in pres. of Zn dust (363) (369), Cr powder (364), uranium dust at 100° for 4 hrs. (365), Al powder (preheated in H₂ at 500°) (301), Ti (393), Al/Hg (366) (367), Al + HgCl₂ (368), Al + HCl (368), AlCl₃ (369) (370), AlCl₃/nitrobenzene cpd. at 30° (372), NaCl.AlCl₃ at 15-20° (373), BeCl₂ at 100° for 6 hrs. (374), TiCl₄ (375), ZrCl₄ (376), SnCl₄/diethyl etherate (377), TlCl₃ (378), iron pyrites (97), Ag₂SO₄ (379), silver methionate (neutral silver salt of methanedisulfonic acid) (379), P₂O₅ (380), or HF in Cu bomb at 100° for 15 hrs. (381) gives (yields: 60-63% (368), 60% (372) (374), 56% (381), 52% (373), 49.5-52.5% (366), 40% (365), 38% (301), 35% (375), 30% (376), 22% (363)) diphenylmethane (1:7120).]

[\bar{C} with toluene (1:7405) in pres. of Zn dust (382) cf. (383) (384), Ti (393), AlCl₃ (369) (370) cf. (385) (386) (371), Al/Hg (367), FeCl₃ (385) (386), BeCl₂ at 110-125° (374), or MeMgI (387) gives p-benzyltoluene [Beil. V-607, V₁-(286), V₂-(511)], b.p. 279°.]

[\bar{C} with m-xylene (1:7420) in pres. of Zn dust (388), finely divided Cu (389), or BeCl₂ at 130-140° (374) gives (73.6% yield (384)) phenyl-m-xylyl-methane [Beil. V-615, V₁-(289), V₂-(518)], b.p. 295-296° cor. (388) (389).]

[Č with mesitylene (1:7455) refluxed 60 hrs. without cat. (391), or in pres. of AlCl₃ (390) at 98-100°, or BeCl₂ at 140-160° (374), gives (78% yield (374)) benzylmesitylene (phenyl-2,4,6-trimethylphenyl-methane) [Beil. V-619], m.p. 36-37° (390), 36° (374).]

[\overline{C} with biphenyl (1:7175) refluxed 3 hrs. without cat. (391), or in pres. of Zn dust at 100° (392), or of Ti (393) gives 4-benzylbiphenyl [Beil. V-708, V₂-(618)], m.p. 85° (392) (391).]

[\bar{C} with naphthalene (1:7200) refluxed 3 hrs. without cat. (391), or in pres. of Zn dust (394) (395), ZnCl₂ (396) at not over 125° (397), AlCl₃ (396) (398), Ti (393), or P₂O₅ at 200° (380) gives mainly 1-benzylnaphthalene [Beil. V-689, V₁-(341), V₂-(604)], m.p. 59° (corresp. picric acid addn. cpd., m.p. 100–101° (396) (400)), accompanied by some 2-benzylnaphthalene [Beil. V-690], m.p. 55–55.5° (398), 55.5° (399) (corresp. picric acid addn. cpd., m.p. 93° (396) (400)). — Note that using ZnCl₂ little 2-benzylnaphthalene is formed (398); also that polybenzylation may occur (399).]

With alcohols (or alcoholates). [\bar{C} with MeOH/KOH (401) or with MeOH/NaOMe (403) in s.t. at 120° (402) gives benzyl methyl ether (1:7475), b.p. 170–171° cor. (403), 170.5° cor. at 760 mm. (3), 170–171° at 759 mm. (377), 170.2–172.2° at 760 mm. (404); $D_4^{25} = 0.9745$ (405), 0.9594 (403), $D_4^{20} = 0.9649$ (403); $n_D^{25} = 1.4983$ (403), $n_D^{20} = 1.5031$ (405), 1.5008 (403) (corresp. picrate, m.p. 115–116° u.c. (406)). — \bar{C} with EtOH/KOH (401), EtOH/NaOEt (403) (377) (407), EtOH/LiOEt (407), or KOEt/liq. NH₃ (408) gives (yields: 81% (408), 63–77% (407)) benzyl ethyl ether (1:7530); b.p. 184.7–185.2° at 761 mm. (377), 184–186° cor. (403); $D_4^{25} = 0.9446$ (403), $D_4^{20} = 0.9490$ (409), 0.9478 (403); $n_D^{25} = 1.4934$ (403), $n_D^{20} = 1.4958$ (403), 1.4955 (409). — For studies of rate of reaction of \bar{C} with EtOH (410) (411) or with EtOH/NaOEt (412) see indic. refs.]

[\tilde{C} with n-PrOH/NaO-n-Pr gives (90-93% yield (413) (403)) benzyl n-propyl ether [Beil. VI-431, VI₁-(219), VI₂-(410)], b.p. 200-202° cor. (403), 68° at 9 mm. (413); $D_4^{25} = 0.9480$ (403), $D_4^{20} = 0.9535$ (403) cf. (413); $n_2^{25} = 1.4932$ (403), $n_2^{20} = 1.4953$ (403), 1.4905 (413); for study of rate at 50.6° see (414). — \tilde{C} with iso-PrOH/NaOisoPr gives (403) benzyl isopropyl ether, b.p. 192-194° cor.; $D_4^{25} = 0.9403$, $D_4^{20} = 0.9457$; $n_D^{25} = 1.4876$, $n_D^{20} = 1.4900$ (403).]

[For corresp. prepn. and constants for benzyl n-butyl ether (403) (417), benzyl sec-butyl ether (417), benzyl isobutyl ether (403), and benzyl isoamyl ether (403) see indic. refs.]

[\bar{C} with benzyl alc./NaOCH₂C₆H₅ in ether (415), with solid KOH at 180-200° (416), with conc. aq. NaOH at 90-120° (416), or with K benzylate in liq. NH₃ (408) gives dibenzyl ether (1:7640).]

With phenols (or phenolates). Č with phenols may react either with phenolic or nuclear hydrogen giving respectively benzyl aryl ethers or benzylated phenols; moreover, the former may, under appropriate conditions, be rearranged to the latter; examples of all these types of reaction are included below.

[\tilde{C} with K phenolate (111) (418) or Na phenolate (417) in boilg. alc., or \tilde{C} with phenol in boilg. alc. NaOMe or NaOEt (419) (420), boilg. aq. NaOH (160) (421), or boilg. acetone + K_2CO_3 (422) gives (73% yield (421)) benzyl phenyl ether [Beil. VI-432, VI₁-(220), VI₂-(411)], m.p. 39° (418) (420) (421) (422), 38-39° (401); b.p. 286-287° (401), 286-288° (419), 178-179° at 35 mm. (422), 124-125° at 4 mm. (417). — Note that although this prod. is completely stable to distn. (419) yet on htg. with ZnCl₂ or in dry HCl as directed (421) it undergoes rearr. (accompanied by some cleavage) giving 2-benzylphenol (1:1431), 4-benzylphenol (1:1485), 2,4-dibenzylphenol (see below), and other prods.]

 $\tilde{\mathbf{C}}$ under suitable conditions also effects nuclear benzylation of phenol yielding a mixt. of o-benzylphenol (1:1431) and p-benzylphenol (1:1485) (the latter usually predominating) accompanied by polybenzylphenols and other products. [E.g., $\tilde{\mathbf{C}}$ with phenol (1:1420) directly at 125° (423) or 150–180° (160), or in pres. of Cu powder at 115–120° (160), Ce at 120–130° (424), Ti (393), AlCl₃ in pet. ether (425), Zn at room temp. (426) (427) (428) (429) in solvent media such as C_6H_6 , toluene, CHCl₃, or EtOH (430), ZnCl₂ on warming (421) (431) (432), 38% HCl in s.t. at 100° (421), P_2O_5 (434) or PCl_5 (435) in toluene at 130–135°, or $\tilde{\mathbf{C}}$ with Na phenolate (or phenol + Na) in dry toluene (419) (436) (437) gives o-benzylphenol + p-benzylphenol (accompanied by other products). — For sepn. of the two benzylphenols by formn. of Na salt of latter in toluene see (438).]

Other phenols, cresols, naphthols, etc., behave analogously but cannot be discussed here. With phenol ethers. With phenol ethers (where no phenolic H atom is available for reaction) Č effects nuclear benzylation. [E.g., Č with methyl phenyl ether (anisole) (1:7445) refluxed 2-3 hrs. (391), or in pres. of Zn (439), Ti (393), Ce (424), W (365), AlCl₃ (440), or ZnCl₂ + dry HCl (421) gives (yields: 63% (393), 57% (424), 52.9% (365)) p-benzylanisole [Beil. VI-676, VI₁-(325), VI₂-(630)], b.p. 305-308° (425), 191-193° at 38 mm. (391), 172-174° at 10 mm. (421), 157-158° at 8 mm. (411), 133-135° at 4 mm. (425); m.p. 20-21° (441).]

[C with phenetole (1:7485) in pres. of Ti (393), U (365), or Ce (424) as directed gives (yields: 76% (393), 80% (365), 88% (424)) p-benzylphenetole [Beil. VI-676, VI₂-(630)], b.p. 317° (442), 315-317° (425), 217° at 37 mm. (442), 203° at 12 mm. (442), 171-173° at 12 mm. (425).]

With organic acids (or their salts). KCN or NaCN. [\bar{C} with alc. KCN (443) (444) (445) (446) in pres. of CuCN and in u.v. light (447), or \bar{C} with aq. alc. NaCN (160) (448), gives (yields: 80-90% (448), 70-76% (447), 70% (160)) benzyl cyanide (α -tolunitrile) (phenylacetonitrile) [Beil. IX-441, IX₁-(176)], b.p. 233-234° cor. (3), 231-232° at 755 mm. (449), 135-140° at 38 mm. (448), 118-119° at 20 mm. (450), 107-107.4° at 12 mm. (18); f.p. -24.6° (26), -26.5° (451); $D_4^{25} = 1.0125$ (452), $D_4^{20.2} = 1.0176$ (453), 1.0157 (454); $n_D^{25} = 1.52105$ (455), $n_D^{20.2} = 1.52422$ (453); for removal from this prod. of traces of benzyl isocyanide with aq. H₂SO₄ at 60° see (456).]

With salts of aliphatic acids. [C with Na formate + anhydrous formic acid in s.t. at 140° (402) gives benzyl formate (1:3596) q.v.]

[Č with KOAc in alc. (443) (457) (460) or benzyl acetate itself (458), or Č with Pb(OAc)₂ in AcOH (459), or Č with NaOAc in AcOH (461) cf. (160) or aq. at 115° (160), gives (80% yield (160)) benzyl acetate (1:3751) q.v.; for study of kinetics see (22).]

[\bar{C} with alc. K propionate (460) or with aq. Na propionate (160) gives benzyl propionate [Beil. VI-436, VI₁-(220), VI₂-(416)], b.p. 222°.]

 $[\bar{C} \text{ with alc. } \text{K } n\text{-butyrate (460), or aq. Na } n\text{-butyrate (160), gives benzyl } n\text{-butyrate (1:3977).}]$

C with salts of other aliphatic acids behaves similarly but detailed treatment will not be given here.

With salts of aromatic acids. [For extensive study of reaction of \bar{C} with NaOBz giving benzyl benzoate (1:4422) see (462) (629)]

With salts of enolic esters. [\tilde{C} with diethyl sodiomalonate gives (yields: 87% (463), 85% (464), 60% (471), 51–57% (465), 50% (470)) (466) diethyl benzylmalonate [Beil. IX-868, IX₁-(381)], b.p. 300° (466), 296–298° (467), 195° at 22 mm. (463), 163° at 14 mm. (468), 170° at 13 mm. (469), 169° at 12 mm. (470) (471), 158° at 8 mm. (472), 128–133° at 6 mm. (473), 145–155° at 5 mm. (465), 150–152° at 4 mm. (474), 140–140.5° at 1.5 mm. (474), 105–108° at 1 mm. (475) (476); $D_4^{20}=1.0750$ (468); $n_D^{20}=1.4872$ (468). This prod. on alk. hydrolysis (for study of kinetics see (477)) and subsequent acidification gives benzylmalonic acid [Beil. IX-868, IX₁-(381)], cryst. from ether, C_6H_6 , or CHCl₃/pet. ether, m.p. 120.6° (478), 120° (479), 120° dec. (468), 119–120° (480), 117–118° (472), 117° (466) (467); on htg. above its m.p. (480) this acid readily loses CO₂ yielding hydrocinnamic acid (1:0615), m.p. 48°.]

[\bar{C} with Na enolate of diethyl benzylmalonate (above) (482) (485), or \bar{C} with diethyl disodiomalonate (483), or \bar{C} with diethyl ethoxymagnesiomalonate (484), gives (yields: 85% (483), 84–87% (485)) diethyl dibenzylmalonate [Beil. IX-937, IX₁-(408)], b.p. 250° at 40 mm. (482), 256–257° at 38 mm. (486), 234–235° at 23 mm. (485), 224–226° at 15 mm. (484), 221° at 11 mm. (483), 192–193° at 2 mm. (487); m.p. 13–14° (486); $D_4^{20}=1.0930$ (482). Note that this prod. always accompanies the diethyl benzylmalonate of preceding paragraph. Diethyl dibenzylmalonate with alc. alk. hydrolyzes with great difficulty (488) (485) but gives dibenzylmalonic acid [Beil. IX-937, IX₁-(407)], m.p. 175° (485), 174° (488), which on htg. above its m.p. loses CO₂ giving dibenzylacetic acid (1:0668), m.p. 89°.]

[\bar{C} with ethyl sodioacetoacetate as directed (489) (490) (491), or \bar{C} with ethyl acetoacetate + BF₃ (492), gives (yields: 70% (491), 23% (492)) ethyl α -benzylacetoacetate [Beil. X-710], b.p. 283–284° u.c. (493), 276° (490), 157–158° at 14 mm. (494), 164–165° at 12 mm. (493), 163–165° at 12 mm. (491), 140–150° at 2–3 mm. (473) (corresp. 2,4-dinitrophenyl-hydrazone, m.p. 71.5° (473)). For ketonic cleavage of this prod. with 20% aq. NaOH (495) or aq. in s.t. at 250° (496) giving benzylacetone [Beil. VII-314, VII₁-(167)], b.p. 236°, see indic. refs.]

[\bar{C} with ethyl acctoacetate as directed (497) cf. (501) or \bar{C} with ethyl α -benzylacetoacetate (above) as directed (489) (493) (498) (499) gives (58% yield (497)) ethyl α , α -dibenzylacetoacetate [Beil. IX-771], m.p. 57° (493) (497) (500), b.p. 230-234° at 12 mm. (493) cf. (497). For ketonic cleavage of this prod. with HI/AcOH giving (80% yield) α , α -dibenzylacetone, b.p. 190-192° at 15 mm., see (497); for acid cleavage giving dibenzylacetic acid (1:0668) see (500) (501).]

With amines. With aliphatic primary amines. [\bar{C} with CH₃NH₂ (2 moles) as 33% soln. in abs. EtOH gives (546) cf. (554) N-methylbenzylamine [Beil. XII-1019, XII₁-(447)], oil, sol. aq., b.p. 184–186° (547) (554), 184–185° u.c. at 749 mm. (548), 184° (549) at 759 mm. (550), 180–181° cor. at 765.5 mm. (546), 180° at 760 mm. (551); $D_{18}^{18.5}$ = 0.9450 (552) (\bar{B} .HCl, 195° (554), 174–175° (546); \bar{B} .PkOH, m.p. 117–118° (532), 113–116° (553)). Note that this prod. is usually accompanied by some N-methyl-dibenzylamine [Beil. XII-1036, XII₁-(453)], b.p. 304–305° cor. at 765.5 mm. (546), 165° at 15 mm. (555), 161–162° at 12 mm. (556) (\bar{B} .HCl, m.p. 200–201° (556); \bar{B} .PkOH, m.p. 107° (5571), also obtd. from \bar{C} with N-methylbenzylamine (above) in pres. of NaOH at 145° for 4 hrs. (555).]

[Č with $C_2H_3NH_2$ in 33% aq. soln. with some alc. in s.t. at 110° gives (558) N-ethylbenzylamine [Beil. XII-1020, XII₁-(448)], oil, spar. sol. aq., b.p. 199° (539), 198° at 750 mm. (550), 194° cor. (558), 191-194° u.c. at 740 mm. (548); $D_{15}^{16.7} = 0.9350$ (552) (B.PkOH, m.p. 122-123° (559)), accompanied by N-ethyldibenzylamine [Beil. XII-1036], b.p. 306° cor. (558).]

With aromatic primary amines. [\bar{C} (1 mole) with aniline (2 moles) in s.t. at 160° for 24 hrs. (502), or htd. in open vessel at 140° (503), or in pres. of I₂ at 50° (504), in alc. (505) or aq. Na₂CO₃ (160), or \bar{C} (1 mole) with aniline (4 moles) in aq. NaHCO₃ at 90–95° (506), or \bar{C} with sodium anilide (from aniline + Na + Cu₂O) at 30–100° under press., (507) gives (yields: 85–87% (506), 56% (160), 49% (504)) N-benzylaniline (N-phenylbenzylamine) [Beil. XII-1023, XII₁-(449)], m.p. 39° (508), 37–38° (509), 37° (510), 36.5–36.8° cor. (503), 36.5° (511), 36° (506) (512); b.p. 306–307° at 759 mm. (509), 201–203° at 37 mm. (510), 178–180° at 12 mm. (506), 171.5° at 10 mm. (508); D_4^{65} = 1.0298 (503); n_D^{65} = 1.59562 (508) (\bar{B} .HCl, m.p. 214–216° (509), \bar{B} .3,5-dinitrobenzoic acid, m.p. 133.0° cor. (249), \bar{B} .2,4-dinitrobenzoic acid, m.p. 121.4–122.2° cor. (513), \bar{B} .p-toluenesulfonic acid, m.p. 148.3–148.8° cor. (250)); for method of sepn. of N-benzylaniline from N,N-dibenzylaniline (below) by reactn. with phthalic anhydride (1:0725) sec (514). — For studies of kinetics of reaction of \bar{C} with aniline in MeOH at 35° and 45° (515) or in EtOH at 35°, 40°, and 45° (516) cf. (4) see indic. refs.; for study of rearr. of N-benzylaniline to p-aminodiphenylmethane see (517).]

[\bar{C} with aniline on htg. cf. (503) (508) in pres of NaOH at 100° (518), anhydrous NaOAc + I_2 at 97° (504), NaNH₂ + Cu powder (519), benzyl alc. (520), or aq. Na₂CO₃ (160) gives N,N-dibenzylaniline (N-phenyldibenzylamine) [Beil. XII-1037, XII₁-(453)], m.p. 71-72° (521), 70° (522), 69.5° (508), 69° (520), 67° (518); b.p. 226° at 10 mm. (508); $D_4^{80} = 1.04436$; $n_D^{80} = 1.60647$ (508) (\bar{B} .HCl, pr. with 1 H₂O from alc (518), but m p unreported; \bar{B} .PkOH, m.p. 131-132° dec. (518); \bar{B} .3,5-dinitrobenzoic acid gives no cpd. (249); B.2,4-dinitrobenzoic acid gives no cpd. (513); \bar{B} .p-toluenesulfonic acid is oil (250); 2 \bar{B} .1,3,5-trinitrobenzene, m.p. 86-87° (523)). — For study of rearr. of N,N-dibenzylaniline hydrochloride to p-aminodiphenylmethane, 2,4-dibenzylaniline, and 2,4,6-tribenzylaniline see (524).]

Č with other aromatic primary amines behaves similarly but cannot be detailed here; however, for a number of cases see (508).

With aliphatic secondary amines. [\bar{C} with $(CH_3)_2NH$ in abs. alc. on stdg. (560) or under reflux (546) (561), or in C_6H_6 at 40–50° for 2 days (562), gives (80% yield (561)) N,N-dimethylbenzylamine [Beil. XII-1019, XII₁-(448)], oil, fairly sol. cold but less sol. hot aq., b.p. 183–184° cor. at 765.3 mm. (560), 180–181° at 749 mm. (540), 178–179° cor. (563), 177.8–178.2° cor. at 766 mm. (561), 178° u.c. (562), 98–99° at 24 mm. (564), 83.5–85.5° at 21 mm. (565), 66–67° at 15 mm. (566), $n_D^{20} = 1.5157$ (564) (\bar{B} .HCl, m.p. 175° (562) cf. (566); \bar{B} .PkOH, m.p. 94° (532), 94–95° (559)).]

[\bar{C} with $(C_2H_5)_2NH$ in s.t. at 100° gives (567) (568) N,N-diethylbenzylamine [Beil. XII-1021, XII₁-(448)], oil, spar. sol. aq., b.p. 212° (569), 211-212° (568) cor. (567), 209° (570) at 755 mm. (551), 96-98° at 17 mm. (564), 94° at 15 mm. (555) (\bar{B} .PkOH, m.p. 120-121° (571), 119° (566)).]

With aromatic secondary amines. [C htd. with N-methylaniline at 100° (521) (525) in pres. of aq. Na₂CO₃ (160), or C with N,N-dimethylaniline + I₂ at 150° (504), or C with mixt. of N-methylaniline and N,N-dimethylaniline at 150° (526), gives (yields: 92.5% (526), 60% (525), 41% (521)) N-benzyl-N-methylaniline (benzyl-methyl-phenylamine) [Beil. XII-1024, XII₁-(450)], b.p. 305-306° (527), 187-188° at 26 mm. (525), 177-178° at 18 mm. (528), 171° at 13 mm. (528), 162-163° at 8 mm. (504); $D_{2}^{26.5} = 1.0421$ (504), $D_{4}^{15} = 1.0475$ (528); $n_{2}^{26.5} = 1.6006$ (504), 1.6071 (528). (B.PkOH, m.p. 131° (529), 128-128.5° (504), 127° (525), 109° (530), 105-107° (531), 104° (532), 103.0-103.5° (533); note disagreement.)] [C htd. with N-ethylaniline (534) in toluene + Na₂CO₃ (535), or C with N,N-diethylaniline

iline + I₂ at 150° (504), or \tilde{C} with a mixt. of N-ethylaniline + N,N-diethylaniline at 150° (526), gives N-benzyl-N-ethylaniline (benzyl-ethyl-phenylamine) [Beil. XII-1026, XII₁-(450)], b.p. 285-286° sl. dec. at 710 mm. (534), 212-220° at 54 mm. (526), 185.5-186.5° at 22 mm. (535) (536), 173° at 12 mm. (528), 163-164° at 6 mm. (504); D_4^{15} = 1.0330 (528); n_D^{15} = 1.5975 (528) (\tilde{B} .PkOH, m.p. 116-117° (536), 114° (535), 113-114° (504), 111-112° (533)). — For important study of sulfonation of N-benzyl-N-ethylaniline see (537).]

With heterocyclic secondary amines. [\bar{C} with piperidine reacts vigorously giving (538) (541) (542) N-benzylpiperidine [Beil. XX-23, XX₁-(8)], b.p. 248° (539), 245-247° (540), 245° (538) (541), 119° at 13 mm (542); $D_4^{20}=0.96049$ (542), $D_4^{16}=0.9625$ (541), $D_4^{15}=0.96451$ (542); $n_{\pi}^{20}=1.52269$ (542) (\bar{B} HCl, m.p. 178° (543)).]

[Direct reaction of \bar{C} with morpholine appears never to have been reported; the expected product, viz., N-benzylmorpholine [Beil. XXVII-7, XXVII₁-(203)] (544), has, however, been prepd. by many other methods and has following constants: b.p. 260-261° cor. (545), 136-136.5° at 14 mm. (544), 128-129° at 13 mm. (542); $D_4^{20} = 1.03874$, $D_4^{15} = 1.03396$ (542) (\bar{B} .HCl, m.p. 244-245° dec. (545); \bar{B} .PkOH, m.p. 193.5-195° cor. (544), 184-185° (545)).]

With aliphatic tertiary amines. [C with (CH₃)₃N in abs. alc. (546) (561) (563) or abs. MeOH at 0° (572) gives trimethyl-benzyl-ammonium chloride [Beil. XII-1020, XII₁-(448)], m.p. 235° (572) dec. (546); for studies of behavior of this prod. toward cat. hydrogenation see (573) (574)]

 $[\bar{C} \text{ with } (C_2H_5)_3N \text{ directly (563) or at 100° in s.t. (567) cf. (570) gives triethyl-benzyl-ammonium chloride [Beil. XII-1021], but its constants are not reported.]$

With aromatic tertiary amines. [C with N,N-dimethylaniline at ord. temp. (575) (577) in MeOH or EtOH (576) gives dimethyl-phenyl-benzyl-ammonium chloride [Beil. XII-1025, XII₁-(450)], tbls. of monohydrate from aq or alc., m.p. 110° (575), 109.5° (578), m.p. anhydrous form, 116° (577); for studies of rate of forms. of this salt in MeOH at 29° and 38° see (579); for studies of behavior on cat. hydrogenation see (573) (580); for use of this quaternary salt as reagt. for introduction of benzyl radical see (473).]

[\bar{C} with N,N-diethylaniline in dry C_6H_6 refluxed 30 min gives (581) diethyl-phenyl-benzyl-ammonium chloride, m.p. 104° (581).]

With heterocyclic tertiary amines. [C with pyridine directly (582) (583) (584) (585) (586) or on htg. at 150° for 6 hrs. (587) gives N-benzylpyridinium chloride [Beil. XX-218, XX₁-(74)], but this salt is difficult to crystallize (586) and its properties are not well established; for kinetics of the addition see (4) (579). — Note that C with pyridine in pres. of Cu on htg. gives (588) a mixt. of 2-benzylpyridine and 4-benzylpyridine, but this type of nuclear benzylation cannot be discussed here.]

With arylhydrazines. Č (1 mole) with phenylhydrazine (2 moles) mixed with cooling (589) and subsequently htd. at $115-120^\circ$ (590) (591) (592), or refluxed in alc. (593), or Č with phenylhydrazine + Na in C₆H₆ (594) or liq. NH₃ (595), or Č with phenylhydrazine + NaNH₂ in liq. NH₃ (73% yield (595)), gives N-benzyl-N-phenylhydrazine (α -benzyl-phenylhydrazine) (Beil. XV-532, XV₁-(164)], oil, b.p. 216-218° at 38 mm. (591), 207-208° at 10 mm. (593) (B.HCl, m.p. 176-177° (596), 170° (593), 164-169° (595), 167° (594) (595), 166-167° (590); corresp. acetyl deriv., m.p. 121-122° (594) (595); corresp. benzyl deriv., m.p. 139-140° (590)); note that the N-benzyl-N-phenylhydrazine is often accompanied (593) (591) by some benzaldehyde N-benzyl-N-phenylhydrazine, m.p. 111-112° (590), 111° (593) (594). — The isomeric N-benzyl-N'-phenylhydrazine (β or sym.-benzyl-phenylhydrazine) [Beil. XV-533, XV₁-(165)], m.p. 35-36°, is not obtd. by benzylation of phenylhydrazine but only by indirect methods.]

[For analogous use of C in prepn. of asym.-benzyl-o-tolylhydrazine, asym.-benzyl-m-tolylhydrazine, asym.-benzyl-p-tolylhydrazine, etc., see (597).]

With arythydroxylamines. [C with N-phenylhydroxylamine in pyridine as directed

- (598) gives (69% yield) N-benzyl-N-phenylhydroxylamine, yellowish lfts., colorless after steam distn., cryst. from pet. ether or EtOAc, m.p. 86° (598) (598) (corresp. B.HCl, m.p. 104-105° (600); corresp. benzoyl deriv., m.p. 115-117° (600)).]
 - Benzyl acetate (1:3751): b.p. 217°. [See also text above under behavior of C with salts of organic acids.]
 - —— Benzyl benzoate (1:4422): b.p. 323-324° cor., m.p. 21°. [For extensive study of prepn. from C with NaOBz see (462) (629).]
 - Benzyl p-nitrobenzoate: m.p. 85°. [See also under benzyl alc. (1:6480).]
 - Benzyl 3,5-dinitrobenzoate: m.p. 113°. [From C with Ag 3,5-dinitrobenzoate refluxed in alc. (190); see also under benzyl alc. (1:6480).]
 - **D** Phenylacetic acid (1:0665): m.p. 76.5°; b.p. 265.5° cor.; Neut. Eq. 136. [From \bar{C} via conversion to C_6H_6 .CH₂.MgCl (see text above under behavior of \bar{C} with Mg) and subsequent treatment with CO₂; yields 75-76% (310), 62.7% (335), 60% (340), 51% (318), 40% (333).]
 - **D** Phenylacetanilide: m.p. 115-116° u.c. (601), 117° cor. (602). [From \bar{C} via conversion to C_6H_6 .CH₂.MgCl (see text above under behavior of \bar{C} with Mg) and subsequent reaction with phenyl isocyanate (602) (601).]
 - —— Phenylaceto-p-toluidide: m.p. 135°. [Presumably from \tilde{C} via conversion to C_6H_6 .CH₂.MgCl and reaction with p-tolyl isocyanate (cf. preceding paragraph) but never actually so reported.]
 - **D** Phenylaceto- α -naphthalide: m.p. 175° (603), 169° (604), 166° u.c. (605). [From \bar{C} via conversion to C_6H_6 .CH₂.MgCl (see text above under behavior of \bar{C} with Mg) and subsequent reaction with α -naphthyl isocyanate (605).]
 - —— Phenylaceto- β -naphthalide: m.p. 159° (604), 158° (603). [Presumably from \bar{C} via conversion to C_6H_5 .CH₂.MgCl (cf. preceding paragraph) and subsequent reaction with β -naphthyl isocyanate but never actually so reported.]
 - Benzylmercuric chloride: m.p. 104° u.c. (323) (324) (326). [From \bar{C} via conversion to C_6H_5 .CH₂.MgCl (see text above under behavior of \bar{C} with Mg) and subsequent reaction (84% yield (323)) (324) (325) with HgCl₂; note, however, that excess C_6H_5 .-CH₂.MgCl gives (325) (326) (327) dibenzylmercury, m.p. 111° (326).]
 - D S-Benzylisothiourea picrate: m.p. 188° (606). [From C with thiourea in alc. htd. 2 min., then treated with alc. PkOH (606). Note that S-benzylisothiourea hydrochloride (S-benzylthiuronium chloride), prepd. from C + thiourea by refluxing alc. soln. (607) (608), and existing in two forms, m.p. 175-176° (608), 172-174° (607), and m.p. 150-151° (608), 146-148° (607), is an important general reagt. for identification of organic acids (607) (608) (609).]
 - ₱ N-Benzylphthalimide: cryst. from AcOH m.p. 116° cor. (610), 116° (611) (612), 115–116° (613), 115° (614). [From C with phthalimide in pres. of dry K₂CO₃ under reflux (72–79% yield (610) (611) or in pres. of NaOEt (612), or from C with K phthalimide under reflux (613), or from benzylamine with phthalic anhydride (1:0725) refluxed in AcOH (614).]
 - N-Benzyl-3-nitrophthalimide: ndls. from CS₂, m.p. 142-143° (615). [From C with K 3-nitrophthalimide under reflux (615).]

 - N-(Benzyl)saccharin: ndls. from alc., m.p. 118° (617), 110-111° (618). [From Č with sodium saccharin in aq. butylcarbitol (1:6517) contg. KI on 30 min. reflux (618).]
- N-(Benzyl)-N-(p-bromobenzenesulfonyl)-p-anisidide: cryst. from 75% alc., m.p. 167.5° u.c. (619). [From Č with N-(p-bromobenzenesulfonyl)-p-anisidide in alc. KOH after 1 hr. reflux (619).]

- p-(Benzyloxy)benzoic acid: m.p. 188-190° (620) (621). [From C with ethyl p-hydroxybenzoate (1:1534) in abs. alc. NaOEt on refluxing 1 hr. (620).]
- Benzyl phenyl ether: m.p. 39°, b.p. 286°. [See text under behavior of $\bar{\mathbf{C}}$ with phenols.]
- © Benzyl 2,4,6-triiodophenyl ether: cryst. from alc., m.p. 123° (622), 122.5° cor. (623). [From Č with 2,4,6-triiodophenol in alc. NaOEt refluxed 30 min. (623) cf. (622).]
- Benzyl α-naphthyl ether: m.p. 77.0-77.0° cor. (624), 74.5-75° (625), 61° (626). [Prepd. only by indirect means; corresp. picric acid addn. cpd., dec. 85-100° (624).]
- Benzyl β-naphthyl ether: m.p. 101.5-102.0° cor. (624), 99-100° (625), 99° (418), 98.5° (627), 98° (628), 95° (626). [From C with β-naphthol (1:1540) in conc. aq. KOH (418) or NaOH (627) on htg. 2 hrs.; corresp. picric acid addn. cpd., m.p. 123.0° cor. (624), 122° (627).]

3:8538 ETHYL
$$\beta$$
-CHLOROCROTONATE $C_6H_9O_2Cl$ Beil. II - 416 CH_3 —C—Cl II₁-(189) II₂-(396) B.P. [184° cor. (1)] $D_4^{20} = 1.106$ (3) (4) $n_D^{20} = 1.4587$ (3) 179–180° (2) 1.101 (7) 77° at 15 mm. (3) $D_4^{19.2} = 1.1018$ (7) $n_D^{10.6} = 1.4588$ (4) 76–77° at 14 mm. (4) (5) 75.3–76.0° at 14 mm. (6) $D_4^{17.9} = 1.1526$ (6) $n_D^{17.9} = 1.4509$ (6) 66° at 10 mm. (7)

[See also ethyl β -chloroisocrotonate (3:8325).]

[For prepn. of \bar{C} from β -chlorocrotonic acid (3:2625) in EtOH with HCl gas (100% yield (2)) (4) or with conc. H₂SO₄ (7) see indic. refs.]

[For form. of \bar{C} from ethyl acetoacetate (1:1710) with PCl₅ as a by-product of prepn. of ethyl β -chloroisocrotonate (3:8325) see (8) (9), but this is definitely not a good means of prepn. of \bar{C} .]

[\tilde{C} with Al/Hg in alc. on warming is both dehalogenated and hydrolyzed yielding (10) crotonic acid (1:0425); note that with \tilde{C} this reactn. goes more readily than with the isomeric ethyl β -chloro-isocrotonate (3:8325).]

[$\ddot{\mathbf{C}}$ (2 moles) with $\mathbf{K}_2\mathbf{S}$ (1½ moles) in 5 vols. abs. EtOH refluxed 16 hrs. (11) or $\ddot{\mathbf{C}}$ with Na enolate of ethyl thioacetoacetate (14) gives (53% yield (11)) diethyl β,β' -thiodicrotonate

S(—C(CH₃)=CH.COOC₂H₅)₂, b.p. 150-153° at 4 mm. {11}, accompanied by some ethyl β -mercaptocrotonate (see below).]

[\bar{C} with alc. NaSH (12) or alc. KSH (11) (13) gives (30% yield (13)) ethyl β -mercaptocrotonate; note that this prod. is apparently a mixt. of the two geom. stereoisomers of ethyl β -mercaptocrotonate with the corresp. keto form, viz., ethyl thioacetoacetate, CH₃-CS.CH₂.COOC₂H₅; for details see indic. refs. — Note also that, since the same prod. results by similar treatment of the isomeric ethyl β -chloroisocrotonate (3:8325), a mixture of the stereoisomers can be used as the starting material.]

[\bar{C} with alkali derivs. of alcohols, phenols, mercaptans, etc., splits out alkali halide yielding corresp. ethyl β-substituted crotonates: e.g., \bar{C} with Na allylate gives (9) ethyl β-allyloxycrotonate; \bar{C} with Na cinnamylate gives (9) ethyl β-cinnamyloxycrotonate; \bar{C} with Na phenolate gives (15) cf. (16) ethyl β-phenoxycrotonate, b.p. 147–148° at 14 mm. (15); \bar{C} with Na salt of ethyl mercaptan gives (17) ethyl β-ethylmercaptoisocrotonate, b.p. 139–141° at 16 mm. (17); \bar{C} with Na salt of benzyl mercaptan gives (90% yield (17)) ethyl β-benzylmercaptocrotonate, cryst. from lgr., m.p. 64.5° (17). Note that in the first three of the five preceding examples either \bar{C} or the isomeric ethyl β-chloroisocrotonate (3:8325) or their mixture gives the same result; for the last two, however, such is not the case.

[\bar{C} with diethyl sodiomalonate gives (5) cf. (18) trans diethyl α -carbethoxy- β -methyl gluconate, ($C_2H_5OOC)_2CH.C(CH_3)$ — $CH.COOC_2H_5$ [Beil. II-853], b.p. 169-170° at 13 mm., $D_4^{20} = 1.0937$, $n_D^{20} = 1.4595$ (5); cf. behavior of stereoisomeric ethyl β -chloroisocrotonate (3:8325).]

Č with phenylhydrazine gives the same (2) products as obtd. from the stereoisomeric ethyl β-chloroisocrotonate (3:8325): e.g., Č (1 mole) with phenylhydrazine (1 mole) at 100° for 6-8 hrs. gives by ring closure mainly (2) 3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-20, XXIV₁-(190)], pr. from aq., m.p. 127°, accompanied by small amts. of 4-benzene-azo-3-methyl-1-phenylpyrazolone-5 [Beil. XXIV-328, XXIV₁-(319)], m.p. 155-156°, and 3,3′-dimethyl-1,1′-diphenyl-bis-pyrazolone-5,5′ [Beil. XXVI-484], dec. at high temp. without melting. — Note that with excess phenylhydrazine (2-4 moles) only traces of the 3-methyl-1-phenylpyrazolone-5 are formed while the amt. of the other two (less desirable) products is greatly increased (2).

$$C_8H_9Cl$$
 Beil. V - 354 V_1 -(176) V_2 —

B.P. 180–182° (1) $D_{20}^{20} = 1.0463$ (4) $I_{20}^{20} = 1.0463$ (4) $I_{20}^{20} = 1.0575$ (3) $I_{20}^{20} = 1.5223$ (3) $I_{20}^{20} = 1.5223$ (3) $I_{20}^{20} = 1.5235$ (4) $I_{20}^{20} = 1.5235$ (4)

[For prepn. of \bar{C} from ethylbenzene (1:7410) with Cl_2 in the dark and in pres. of I_2 (2) or with $SO_2Cl_2 + AlCl_3$ (1) see indic. refs.; for prepn. of \bar{C} from chlorobenzene (3:7903) with EtBr + $AlCl_3$ (3) or EtOH + $AlCl_3$ (4) see indic. refs.; for prepn. of \bar{C} from p-chloroacetophenone (3:6735) by reduction with Zn/Hg + HCl (27% yield) see (5).]

 \bar{C} on oxidn. with CrO₃ in AcOH (3) or with HNO₃(2) yields p-chlorobenzoic acid (3:4940), m.p. 234° (3).

[C on attempted nitration gives only (3) a liquid mixt. of isomers.]

[C with Br₂ in AcOH + trace of I₂ yields (2) 3-bromo-4-chloro-ethylbenzene, b.p. 143-144° at 10 mm. (2); C with Br₂ in CHCl₃ exposed in silica flask to sunlight yields (2) p-chloro-α-bromo-ethylbenzene, b.p. 120-121° at 8 mm. (2).]

64-66°

[\tilde{C} on htg. with 15% NaOH + Cu powder for 2 hrs. at 315-320° in a steel autoclave is thought (6) to undergo partial rearr., thus yielding *m*-ethylphenol (1:1744).]

[Č on passing through an Fe or Ni-Cr tube at 675-700° is alleged (7) to lose HCl with production of styrene (1:7435).]

[See also γ -chlorocrotonic acid (3:2170).]

Although \bar{C} is capable of existing in two geometrically isomeric forms, only this one is known; collateral evidence (but not actual proof) indicates that \bar{C} is the *trans* stereoisomer. [For prepn. of \bar{C} from ethyl vinylacetate [Beil. II-407] (5) with Cl₂ in CCl₄ (forming ethyl β , γ -dichloro-n-butyrate) followed by treatment with alc. NaOEt at 0° (splitting out HCl) and giving 65% yield see (5); from ethyl γ -chloro- β -hydroxy-n-butyrate [Beil. III-310, III₁-(116)] by dehydration with P₂O₅ (yields: 65% (4), 62.5% (3), 60% (2)) (6) (accompanied by some γ -chlorocorotonic acid (3:2170) (3) (2) and also by ethyl γ -chlorovinylacetate (3)) see indic. refs.l

 \tilde{C} on hydrolysis with Ba(OH)₂ below 0° or even (but less advantageously) with KOH gives (60% yield (3) (5)) (7) (2) γ -chlorocrotonic acid (3:2170), m.p. 83°; note, however, that hydrolysis with hot cone. alk. gives also two other products, viz., O(CH₂—CH—CH.-COOH)₂, m.p. 195° (2), and γ -hydroxycrotonic acid, m.p. 108° (2).

[$\bar{\rm C}$ in EtOH/NaOEt undergoes addition of EtOH to unsatd. linkage followed to small extent by elimination of HCl with consequent ring closure to a cyclopropane deriv.; e.g., $\bar{\rm C}$ (0.134 mole) in 2½ pts. EtOH treated dropwise in cold with soln. of Na (0.087 mole) in the same vol. of EtOH as above gives (yields: 42% (8), 25% (9)) ethyl γ -chloro- β -ethoxy-n-butyrate, b.p. 108.0–108.5° at 20 mm., $D_{-}^{17.5} = 1.078$, $n_{-}^{17.5} = 1.4295$ (8), accompanied by a little (3% yield (8)) ethyl 2-ethoxycyclopropane-1-carboxylate (1-carbethoxy-2-ethoxycyclopropane), b.p. 77.50–77.75° at 13 mm., $D_{-}^{18} = 0.995$, $n_{-}^{18} = 1.453$ (8); the latter is also obtd. (22% yield (8)) by distn. of the ethyl γ -chloro- β -ethoxy-n-butyrate with dry powdered KOH at 180° and 45 mm. press.]

[\bar{C} on dropwise addition to dry powdered KOH at 180° gives ethyl cyclopropane-1-carboxylate [Beil. IX-4, IX₁-(3)], b.p. 130° at 728 mm., $D=0.970, n_{-}^{15}=1.416$.]

[\bar{C} with excess dry powdered CaBr₂ heated several days under reflux gives (2) (10) ethyl γ -bromocrotonate. — \bar{C} (1 mole) with NaI (1 mole) in acetone reacts readily at ord. temp. pptg. NaCl (80% theory) and yielding (3) ethyl γ -iodocrotonate, b.p. 92–93° at 2 mm.]

[\bar{C} with NaOAc in AcOH heated at 100° cf. (11) yields (8) ethyl γ -acetoxycrotonate, b.p. 115–116° at 15 mm., $D_{-}^{23} = 1.075$, $n_{-}^{23} = 1.4445$ (11).]

[\bar{C} with conc. aq. NH₄OH not only has its halogen replaced by $-NH_2$ but also is hydrolyzed with consequent formn. of γ -aminocrotonic acid; this was not isolatable as such but only as its picrate, the m.p. of which, however, is not reported (2).]

[\bar{C} with Me₃N (excess) in alc. contg. a trace of NaI in s.t. at 100° followed by evapn. with HCl gives (4) γ -dimethylaminocrotonic acid chloromethylate (γ -dimethylaminocrotonbetain chloride), m.p. 203-205° dec. (4).]

XII-1111, XII₁-(483)] via diazotization and use of Cu_2Cl_2 reaction see (2) (1); for formn. of \tilde{C} from 1,3-dimethylbenzenesulfonic acid-4 [Beil. XI-123, XI₁-(34)] by htg. with $SOCl_2$ in a s.t. at 160° for 3-4 hrs. see (8); for formn. of \tilde{C} from 4-bromo-1,3-dimethylbenzene via conversion to RMgBr and reactn. with Cl.CN see (4); for prepn. of \tilde{C} from p-chlorotoluene (3:8287) by chloromethylation with Cl_2O + HCl to 4-chloro-3-(chloromethyl)-toluene and subsequent reduction with Zn + NaOH see (20).]

[For reactn. of \bar{C} with 4,4'-tetramethyldiaminobenzophenone (Michler's ketone) + Na in toluene yielding bis-(4-dimethylaminophenyl)-4-m-xylylcarbinol, odorless ndls. from m.p. 145°, see (9); for use of this prod. in prepn. of homologs of malachite green alc., (10) (11) and other dyestuffs (12) see indic. refs.]

 \tilde{C} on oxidn. with $K_2Cr_2O_7 + H_2SO_4$ (6) (3) (7) yields 4-chloro-3-methylbenzoic acid (3:4915), cryst. from aq., m.p. 209-210° (3) (7). — \tilde{C} on oxidn. with aq. KMnO₄ gives (13) (14) 4-chlorobenzenedicarboxylic acid-1,3 (4-chloroisophthalic acid) (3:4980), ndls. from hot aq., m.p. 294.5° (14), 295° (13).

 \bar{C} in Ac₂O treated with mixt. of HNO₃ + H₂SO₄ as specified (15) yields 6-nitro-4-chloro-1,3-dimethylbenzene [Beil. V-379, V₁-(184)], m.p. 42° (15). [The other mononitro derivs. of \bar{C} have been prepd. indirectly, viz., 5-nitro- \bar{C} [Beil. V-379] (16), m.p. 51°; 3-nitro- \bar{C} , m.p. 72-73° (17).]

 \tilde{C} on sulfonation with a mixt. of equal pts. fumg. H_2SO_4 + conc. H_2SO_4 yields (18) 4-chloro-1,3-dimethylbenzenesulfonic acid-6 [Beil. XI-123] (corresp. sulfonamide, m.p. 195° (3)).

Č on bromination with Br₂ + HNO₃/H₂SO₄ mixt. (19) yields 6-bromo-4-chloro-1,3-dimethylbenzene [Beil. V-374], m.p. 66° (19).

 \bar{C} even on stdg. tends to lose HCl with formn, of styrene and styrene polymers (9); such decompn, is facilitated by pres. of any HCl and \bar{C} could not be dried with P_2O_5 (10).

[Both opt. act. stereoisomerides of C are known but cannot be discussed here.]

[For prepn. of $\bar{\mathbb{C}}$ from methyl-phenyl-carbinol (1:6475) with 6 N HCl (75% yield (3)) (7), with aq. HCl in pres. of $\mathrm{CaCl_2}$ (2) (8), with HCl + $\mathrm{ZnCl_2}$ (71% yield (11)), with SOCl₂ (82-88% yield (11)) (4) (5) (10), or with acetyl chloride (3:7065) (12) see indic. refs.; from ethylbenzene (1:7410) with $\mathrm{Cl_2}$ in light (1) (13) (14) (15) or in pres. of 1% PCl₅ (90% yield (16)) see indic. refs.; from styrene (1:7435) by addn. of HCl (9) (17) (18) under press. in solvent (100% yield (19)) or at -80° (68% yield (29)) see indic. refs.; for formn. of $\bar{\mathbb{C}}$ from methyl-phenyl-carbinyl MgBr during reaction with cyanogen chloride (47% $\bar{\mathbb{C}}$ + 10% methyl-phenyl-carbinyl cyanide + 5% 2,3-diphenylbutane) see (6); for formn. of $\bar{\mathbb{C}}$ from methyl phenyl ketone (acetophenone) (1:5515) during reduction with $\mathrm{Zn/Hg}$ + HCl see (20).]

[C passed at elevated temp. over dehydrohalogenating cat. (21), or htd. with pyridine in s.t. 6 hrs. at 130° (77% yield (22)), or boiled with a small excess quinoline for ½ hr. (75–80% yield (16)) (23), or its quat. salt with pyridine htd. in vac. (24), or htd. with acids less volatile than HCl (25), or htd. with salts of org. bases (26) (23) yields styrene (1:7435), b.p. 145°.]

[\bar{C} with H₂ and Pd in pres. of MgO as specified (8) gives rapidly and quant ethylbenzene (1:7410); note that \bar{C} reduces much more readily than the isomeric β -chloroethylbenzene (3:8712) (8).]

 \bar{C} on hydrolysis, e.g., by boilg. with 25% excess of 10-15% aq. Na₂CO₃ soln., gives (90% yield (16)) (27) methyl-phenyl-carbinol (1:6475) q.v.; \bar{C} with aq. alc. or with aq. alc. NaOH gives at 50° only (5) methyl-phenyl-carbinol; at 100° both styrene (1:7435) and α,α -diphenyl-diethyl ether are also formed (5); under certain circumstances α -diphenyl-diethyl ether may also appear (5) (1). [For study of hydrolysis of \bar{C} in acetone contg. HgCl₂ see (4).]

[\overline{C} with aq. Na₂SO₃ on boilg. for 9 hrs. (14) (7) gives (43-45% yield (14)) sodium α -phenylethanesulfonate (corresp. sulfonyl chloride, ndls. from alc., m.p. 79° (14) cf. (7), corresp. sulfonamide and anilide are unreported).]

C on oxidn. with Cu(NO₃)₂ (13) or on boilg. with aq. or dil. alc. soln. of hexamethylenetetramine (28) gives (60% yield (13)) methyl phenyl ketone (acetophenone) (1:5515).

3:8700 m-XYLYL CHLORIDE (m-Methylbenzyl chloride, ω-chlorom-xylene)

$$\begin{array}{cccc} CH_2Cl & C_8H_9Cl & Beil. \ V - 373 & & V_{1^-}(183) \\ CH_3 & & V_{2^-}(291) & & & \end{array}$$

 $D_{20}^{20} = 1.064 (2) \quad n_{\rm D}^{25} = 1.5327 (1)$

[For special study of prepn. (76% yield) by chlorination of m-xylene (1:7420) in light see (1).]

 \bar{C} stood with N/10 alc. NaOEt at 30° yields ethyl m-xylyl ether [Beil. VI-494], b.p. 202°, to extent of 10.9% in 6 hrs., 32.4% in 24 hrs. (3) cf. (4). [For data on rate of hydrolysis with acid or alkali in acetone soln. at 30° see (5).]

Č with Mg in ether yields R.MgCl; on carbonation at 0° (7) this yields m-CH₃.C₆H₄.CH₂.-COOMgCl; this upon acidification presumably (no record) would yield m-tolylacetic acid [Beil. IX-528], m.p. 61°; upon treatment (8) with C₂H₅MgBr, however, it gives a mixt. contg. 57.6% m-tolylmalonic acid, colorless pdr. from CHCl₃, m.p. 130-131° with loss of CO₂ (8). [Use of isopropyl MgCl in place of C₂H₅MgBr gave 88% of m-tolylmalonic ac. (8).]

 \overline{C} on boiling with Pb(NO₃)₂ soln. (2), or Cu(NO₃)₂ soln. (30% yield (6)), or alk. Na₂CrO₄ (90% yield (6)) gives *m*-tolualdehyde (1:0208).

N-(o-Xylyl)phthalimide [Beil. XXI-467]: ndls. from alc., m.p. 117-118°. [Reported
 (9) from m-xylyl bromide and therefore presumably obtainable under appropriate
 conditions from C.]

3:8710 o-XYLYL CHLORIDE (o-Methylbenzyl chloride,
$$\omega$$
-chloro-o-xylene) CH₃ C₈H₉Cl Beil. V - 364 V₁-(180) CH₂Cl V₂-(283)

B.P. 197-199° (1) 92-94° at 20 mm. (2) 76-80° at 14 mm. (3) Lachrymatory oil.

[For prepn. (88% yield) from o-tolylcarbinol (1:5922) by action of thionyl chloride and pyridine see (2), by action of $H_2SO_4 + HCl$ (85-92% yield) see (3); the prepn. from o-xylene (1:7430) by action of trioxymethylene + HCl gives a mixture of \bar{C} and p-xylyl chloride (3:8660) (4) (5) (6).]

 \bar{C} stood with N/10 alc. NaOEt at 30° yields ethyl o-xylyl ether [Beil. VI-484], oil, b.p. 208-210°, to extent of 21% in 6 hrs., 52% in 24 hrs. (7) cf. (8). [For data on rate of hydrolysis with acid or alkali in acetone soln. at 30° see (9).]

Č with Mg in ether yields R.MgCl; on carbonation at 0° (10) this yields o-CH₃.C₆H₄.CH₂.-COOMgCl; this upon acidification presumably (no record) would yield o-tolylacetic acid [Beil. IX-527], m.p. 88−89°; upon treatment (11) with C₂H₅MgBr, however, it gives 83.3% yield of o-tolymalonic ac., ndls. from aq., m.p. 139−140°, with loss of CO₂ (11), + 16% yield of o-tolylacetic ac.

Č refluxed 5 hrs. with dil. alc. KCN gives 74% yield (2) o-tolylacetonitrile [Beil. IX-527], b.p. 244°, which on boiling 1 hr. with dil. H₂SO₄ (2) gives 73% yield (2) of o-tolylacetic ac. [Beil. IX-527], ndls. from aq., m.p. 88-89°.

Č on warming at 100° with 1.3 moles pyridine gives ppt. of o-xylylpyridinium chloride, cryst. from CH₃OH + dry ether, m.p. 183° (12).

N-(o-Xylyl)phthalimide [Beil. XXI-467]: cryst. from alc., m.p. 148-149°. [Reported (13) from o-xylyl bromide and therefore presumably obtainable under appropriate conditions from C.]

Colorless oily liquid.

[For prepn. of \tilde{C} from β -phenylethyl alc. (1:6505) with fumg. HCl in s.t. 4 hrs. at 140° (57% yield (13)) (15), with conc. HCl + ZnCl₂ (82% yield (8)), with 6 N HCl (small yield (16)), with PCl₅ in CHCl₃ (yield 70% (3)) (10) (12) (prod. conts. P compounds (10) removed with NaHCO₃ (12)) or in CCl₄ (80% yield (5)), with SOCl₂ at room temp. (yields:

87% (10) (11), 74% (6)) or warming in dimethylaniline (91% yield (1)) (17) (for intermediate forms, of β -phenylethyl chlorosulfite see (18)) see indic. refs.]

[For formn. of Č from β -chloroethyl p-toluenesulfonate with C_6H_5MgBr (36% yield (19)) (20) see indic. refs.; from di-(β -chloroethyl) sulfate with C_6H_5MgBr (25% yield) see (21); from C_6H_5HgCl with ICl in CCl₄ (35% yield) see (11); from methyl β -phenylethyl ether (22) or N-(β -phenylethyl)benzamide (7) (15) or N,N-bis-(β -phenylethyl)benzamide (60% yield (23)) with PCl₅ see indic. refs.; from β -phenylethylamine hydrochloride with HNO₂ see (24); from bis-(β -phenylethyl) ether with AcCl + ZnCl₂ see (9); from bislg. ethylbenzene (1:7410) with Cl₂ (as by-product of the α -isomer) see (25) (26) (27) (35).]

 \ddot{C} on oxidn. with CrO_5/H_2SO_4 is much more resistant than benzyl chloride (3:8535) (28) but ultimately yields benzoic acid (1:0715), m.p. 121°. — [\ddot{C} passed with steam and air at 450° over pumice impregnated with V_2O_5 gives (29) benzoic acid (52%), benzaldehyde (35%), phenylacetaldehyde (6%), and styrene (3%).]

[\bar{C} on reduction with $H_2 + Pd/CaCO_3$ in pres. of MgO ultimately gives ethylbenzene (1:7410) but rate is very much slower than with α -chloroethylbenzene (3:8667) (12).]

[For study of rate of reactn. of \bar{C} with aq. alc. NaOH (much slower than with α -chloroethylbenzene (3:8667) see (10); for rate with NaOEt see (30); for rate with NaOPr see (47); \bar{C} with KOC₆H₅ in alc. gives (45–50% yield (31)) phenyl β -phenylethyl ether [Beil. VI-479], b.p. 180° at 23 mm., $D_4^{20} = 1.0501$ (31); \bar{C} with NaOAc + AcOH yields (32) mainly β -phenylethyl acetate (1:3922), but 15% of the isomeric methyl-phenyl-carbinyl acetate [Beil. VI-476, VI₁-(236)], b.p. 222° (32), is also formed.]

[C with NaI in acetone boiled 4 hrs. gives (33) β-phenylethyl iodide, b.p. 125-128° at 18-20 mm. (33) (for rate of reactn. of C with KI in acetone see (13) (34)): C with alc. KCN yields (25) (26) (27) β-phenylethyl cyanide [Beil. IX-512, IX₁-(199)] which on hydrolysis gives hydrocinnamic acid (1:0615), m.p. 48-49°; C on boilg, for 20 hrs. with conc. aq. Na₂SO₃ gives (65% yield (35)) sodium β-phenylethanesulfonate (corresp. sulfonyl chloride, m.p. 34° (35); corresp. sulfonamide, m.p. 119° (35), 124° (20); corresp. sulfonamide m.p. 77° (35)) accompanied by a little β-phenylethyl alcohol (1:6505) but without any evolution of SO₂ (contrary to previous report (36)).]

Č with Mg in dry ether yields (2) (11) (19) (5) (37) (38) C₆H₅.CH₂.CH₂.MgCl: this RMgCl epd. with dry CO₂ yields (19) hydrocinnamic acid (1:0615), m.p. 48-49°; with phenylisocyanate it yields (2) hydrocinnamanilide, m.p. 96°; with HgCl₂ it gives (85% yield (11)) β-phenylethyl HgCl, m.p. 163-166° (11). [For reactn. of this RMgCl epd. with cyclopentanone (38), cyclohexanone (37), α-tetralone (37), and other ketones see indic. refs.]

[\bar{C} with AlCl₃ in CS₂ or lgr. gives (12) (1) a resin; \bar{C} with AlCl₃ + C₆H₆ gives (85% yield (39)) (40) dibenzyl (1:7149) together with other products (26) (27).]—[\bar{C} with Na in C₆H₆ or ether (41) gives ethylbenzene (1:7410) and 1,4-diphenylbutane [Beil. V-616, V₁-(290)], m.p. 52°.] [For behavior of \bar{C} with benzhydryl sodium (42), triphenylmethyl sodium, etc. (6), see indic. refs.]

[Č on mononitration, e.g., with HNO₃ (D=1.52) at -15° (3) (24) (4) (45) or even at -70° (45) gives (70% yield (44)) β -(4-nitrophenyl)ethyl chloride, m.p. 49° (3) (44), 48–49° (4), 48° (45) (43), 46–47° (24), accompanied by (30% yield (44)) β -(2-nitrophenyl)ethyl chloride, an oil, b.p. 156.5–158° at 15 mm., $D_{-}^{20}=1.5620$, $n_{D}^{20}=1.562$ (46); some β -(2,4-dinitrophenyl)ethyl chloride, m.p. 136° (4), is sometimes formed (4).]

 $n_D^{16.5} = 1.56226$ (2)

 $n_{\rm D}^{17} = 1.56199$

Colorless liq. with arom. odor soon changing to that of formaldehyde and benzoyl chloride from air oxidation (5). — Č could not be polymerized even in u.v. light, by peroxides or SnCl4 (12).

[For prepn. of \tilde{C} from methyl phenyl ketone (acetophenone) (1:5515) with PCl₅ see (2) (1) (5) (6); from α,α -dichloroethylbenzene ("acetophenone dichloride") on htg. see (7); from β -bromo- α -chloroethylbenzene (styrene chloro-bromide) with alc. KOH in the cold (70% yield) see (4); from α,β -dichloroethyl benzene (styrene dichloride) (3:6685) with aq. alc. NaOH at 50-60° (89% yield) see (13).]

 \tilde{C} on boilg. with conc. HCl (4) (1), or \tilde{C} with 80% H₂SO₄ at 60° for 4 hrs. (13) cf. (14), gives (81% yield (13)) cf. (14) acetophenone (1:5515).

Č is resistant to actn. of alc. KOH (5); Č on refluxing for 13 hrs. with very conc. alc. NaOEt gives (8) some phenylacetylene (1:7425) together with other prods. (8).

[\tilde{C} with NOCl yields (9) α,β,β -trichlorostyrene, b.p. 148–150° at 20 mm. (9); \tilde{C} htd. with alc. KCN in s.t. at 200–220° yields (10) phenylsuccinonitrile which on saponification gives phenylsuccinic acid (1:0790); \tilde{C} with Na in liq. NH₃ gives (15% yield (10)) ethylbenzene (1:7410); \tilde{C} with NaNH₂ in liq. NH₃ gives (57% yield (11)) phenylacetylene (1:7425); \tilde{C} in alc. contg. BF₃/EtOAc (12) or in pres. of HCl (1) condenses with itself by loss of 3 HCl yielding 1,3,5-triphenylbenzene (1:7270).]

 \tilde{C} (10 g.) in C_6H_6 (10 ml.) stood 3 days with PCl_5 (30 g.) in C_6H_6 (50 ml.), then poured into aq. worked up as directed (13), yields 1-phenyl-1-chloroethylenephosphinic acid-2, C_6H_6 —C(Cl)—CH— $P(=0)(OH)_2$, ndls. from dil. HCl, m.p. 162° (13) (together with a little benzoic acid (1:0715), m.p. 121°).

Liquid with odor of hyacinth; used in perfume industry. Although C should exist in two geom. stereoisomeric forms only this one has as yet been recognized. — Volatile with steam.

[For prepn. of \bar{C} from cinnamic acid (1:0735) with Cl₂/aq. or HOCl (1) (3) (10) (8) (12), with Cl₂ in EtOH (11), with NaOCl (13) (20), or Ca(OCl)₂ (14) see indic. refs.; from α,β -dichlorohydrocinnamic acid (cinnamic acid dichloride) [Beil. IX-514, IX₁-(200)] with Na₂CO₃ at 100° (yield: 97% (15) (1)) (9) (6) or with NaOAc (60% yield (5)) see indic. refs.; from α -chloro- β -hydroxyhydrocinnamic acid [Beil. X-250, X₁-(110)] by htg. with aq. in s.t. at 200–220° see (2) cf. (3): for formn. of \bar{C} from ω,ω -dichloroethylbenzene [Beil. V-354] with alc. KOH in s.t. at 120° see (4); from phenyl-trichloromethyl-carbinol [Beil. VI-476, VI₁-(237)] with Zn dust in alc. see (16); from α,β -dichloroethylbenzene (styrene dichloride) (3:6885) by htg. with pyridine (17) or by passing over Al₂O₃ at 360–400° and 85–105 mm. (92% yield (20)) see indic. refs.; from C₆H₅MgBr with acetylene tetrachloride (3:5750) see (18): from styrene chlorohydrin (3:9570) by dehydration over HPO₃ on silica gel at 370–400° and 95–115 mm. (63% yield) see (20).

[$\bar{\mathbf{C}}$ with Cl₂ in CHCl₃ yields (1) α,β,β -trichloroethylbenzene [Beil. V-355], b.p. 254.5–255.5° sl. dec. at 770 mm., b.p. 137° at 21 mm., $D_4^{15}=1.3619, n_D^{15}=1.5652$ (1); $\bar{\mathbf{C}}$ with

Br₂ in CHCl₃ yields (1) (13) (19) β -chloro- α,β -dibromoethylbenzene [Beil. V-356], ndls. from alc., m.p. 32° (1) (13), b.p. 165° sl. dec. at 26 mm. (1).

 \ddot{C} with alc. KOH in s.t. at 200-250° is partly resinified (2); \ddot{C} with very conc. alc. KOH gives on very strong htg. a chlorine-free oil which on distn. with aq. gives phenylacetaldehyde (1:0200) (4). [For rate of loss of halogen with alc. KOH see (5).] — \ddot{C} with EtOH/NaOEt in s.t. at 175-182° for $5\frac{1}{2}$ hrs. gives (66% yield (20)) β -ethoxystyrene [Beil. VI-564, VI₁-(279)] for conversion of which to phenylacetaldehyde see (20).]

 \bar{C} on oxidn. with $K_2Cr_2O_7 + H_2SO_4$ or with HNO₃ (D=1.2) gives (2) benzoic acid (1:0715).

3:8725 2-CHLORO-1,3,5-TRIMETHYLBENZENE
$$C_9H_{11}Cl$$
 Beil. V - 408 (eso-Chloromesitylene) CH_3 V_1 — V_2 -(315) CH_3 CH_3 CH_3 CH_3 CH_3 B.P. 204-206° (1) $D_-^{20} = 1.0337$ (2) $n_D^{20} = 1.52119$ (2) 103.6-103.7° at 25 mm. (2)

 \bar{C} remains liquid down to -20° . \bar{C} is insol. aq., eas. sol. alc. or ether; volatile with steam but less so than dichloromesitylene.

[For prepn. of \bar{C} from 1,3,5-trimethylbenzene (mesitylene) (1:7455) with Cl₂ either directly (1) or in CHCl₃ at 0° (75% yield (3)) accompanied by 2,4-dichloro-1,3,5-trimethylbenzene (1) and/or 2,4,6-trichloro-1,3,5-trimethylbenzene, m.p. 209° (3), 204-205° (1)), or from 2,4,6-trimethylphenol (mesitol) (1:1467) with PCl₅ in C₅H₅ (2) see indic. refs.]

C with fumg. H₂SO₄ (20% SO₃) shaken for 15 min. gives 2-chloromesitylenesulfonic acid

(corresp. sulfonyl chloride, oil (3), sulfonamide, m.p. 165.5-166° (3)) but gives no evidence of any Jacobsen rearrangement (3).

Č with fumg. HNO₃ yields (1) (4) mainly 4,6-dinitro-2-chloromesitylene, colorless ndls. from alc., m.p. 178-179° (1), 176.5° (4) [the mononitration prod., 4-nitro-2-chloromesitylene, has m.p. 56-57° (1)].

 \bar{C} on oxidn. with boilg. dil. HNO₃ (1 conc. HNO₃: 2 aq.) for 30 hrs. yields (1) 4-chloro-3,5-dimethylbenzoic acid ("chloromesitylenic acid") [Beil. IX-536], browns at 220° but does not melt (unsuitable as derivative). [Note that a little 4-nitro-2-chloromesitylene m.p. 56-57° (1), may be formed in this process; furthermore that attempts to oxidize \bar{C} with $K_2Cr_2O_7$ + dil. H_2SO_4 yield only acetic acid (1).]

C on oxidn. with aq. KMnO₄ gives (63.5% yield (5)) 2-chlorobenzenetricarboxylic acid-1,3,5 (chlorotrimesic acid) (3:4975), readily sol. cold aq., excessively sol. hot aq., m.p. anhydrous acid 285° (5), monohydrate 278° (6).

3:8770 3-CHLORO-4-ISOPROPYL-1-METHYLBENZENE C10H13Cl Beil. V - 423 (3-Chloro-p-cymene) **V**1--- V_{2} -(326)

B.P. 217.1° at 760 mm. (1)
$$D_4^{18} = 1.01799$$
 (5) $213-214^\circ$ cor. at 735.6 mm. (2) $n_D^{18} = 1.51796$ (5) 214° at 760 mm. (3) $120-122^\circ$ at 20 mm. (4) (5)

[For prepn. of C from thymol (3-hydroxy-p-cymene) (1:1430) with PCl₅ see (1) (4) (5) (6); for prepn. of C from 2-bromo-p-cymene [Beil. V-423, V₁-(205)] by chlorination to 5-chloro-2-bromo-p-cymene [Beil. V-424] followed by replacement of Br by H with Zn/Cu at 200° (7) or in alc. alk. (8) see (7) (8); for prepn. of C from 3-chloromenthadiene dibromide by elimination of 2 HBr with quinoline see (3).

 $[\bar{C} \text{ on oxidn. with 15 pts. boilg. dil. HNO}_3 (D = 1.24) gives (2) a mixt. of 3-chloro-4$ isopropylbenzoic acid (3-chlorocuminic acid) [Beil. IX-549], m.p. 122-123°, 2-chloro-4methylbenzoic acid (2-chloro-p-toluic acid) (3:4355), m.p. 155°, and 2-chloroterephthalic acid (3:4995), m.p. about 320°.]

 $[\bar{C}]$ on mononitration with 6 pts. conc. HNO₃ (D=1.48) below 15° for 3-4 hrs. as directed (4) yields 6-nitro-3-chloro-p-cymene = 2-nitro-5-chloro-p-cymene [Beil. V-424], oil, b.p. 142-150° at 13 mm. (4) (which with piperidine for 30 min. at 100° yields (4) 2-nitro-5piperdino-p-cymene, oil, b.p. 146-148° at 32 mm. (4)).

 \bar{C} on dinitration by adding to 10 pts. conc. HNO₃ (D=1.5) below -5° during 15 min., then poured onto ice, yields (4) (9) a mixt. from which can be isolated 2,6-dinitro-3-chlorop-cymene, m.p. 105-106° (9), 102.5-103.5° (4) (which with piperidine (5 pts.) at 100° for 1½ hrs. yields 2,6-dinitro-3-piperidino-p-cymene, pale yel. ndls. from alc., m.p. 126-127° (9), 123-124° (4)).

[During this dinitration of C there is also formed a by-prod. formerly (4) supposed to be 2-chloro-3,5-dinitro-4-methylacetophenone but more recently (10) shown to be 3-chloro-4.6-dinitrotoluene, m.p. 90.0-90.5° (10); this prod. with piperidine gives (10) 3-piperidino-4.6-dinitrotoluene, m.p. 116-116.5° (10).]

 Beil. V — $(\beta\text{-Chloro-}ter\text{-butyl})\text{benzene};$ $(\beta\text{-chloro-}\alpha,\alpha\text{-dimethyl})\text{ethylbenzene}$ CH_3 V_1 — C_2 CH_2Cl CH_3 V_2 -(320) CH_3 C_2 CH_3 C_2 CH_3 C_3 C_4 C_4 C_4 C_5 C_5 C_5 C_6 C_7 C_8 C_9 C_9

[For prepn. of \bar{C} from benzene (1:7400) + methallyl chloride (3-chloro-2-methylpropene-1) (3:7145) by condensation in presence of conc. H₂SO₄ (68% yield (1)) or HF (66% yield (2)) see (1) (2); for formn. from *ter*-butylbenzene (1:7460) by treatment with SO₂Cl₂ see (3); for formn. from corresp. alc. (2-methyl-2-phenylpropanol-1) with SOCl₂ see (5) (4).]

C htd. with 13% alc. KOH at 86° for 24 hrs. is unchanged (2); C refluxed 11½ hrs. with NaOEt in abs. alc. (1) or refluxed 9½ hrs. with pyridine (1) is recoverable to extent of 87-88% (1).

[For study of behavior of \bar{C} with Na, Na in liq. NH₃, NaEt, NaNH₂, etc., or on pyrolysis see (1).]

 \bar{C} with sublimed Mg (not comml. Mg even after activation) + a trace of I₂ yields (3) neophyl MgCl; this RMgCl on oxidation with O₂ gives (71.6% yield (1)) the corresp. alc., 2-methyl-2-phenylpropanol-1, b.p. 131° at 30 mm. (1), 122-123° at 20 mm. (5), n_D^{20} = 1.5261 (N-phenylcarbamate, m.p. 59-60° (5), 59.5-60.5° (1); N-(α -naphthyl)carbamate, m.p. 91.5-92.5° (1)). [For behavior of \bar{C} with C₆H₅MgBr in pres. of CoBr₂ see (8).]

- \oplus β -Phenylisovaleric acid: cryst from pet. eth., m.p. 57.5-58.5° (6), 58-59.5° (1). [From RMgCl on carbonation and subsequent hydrolysis; yield 81.6% (1).]
- β-Phenylisovaleranilide: m.p. 122-123° (3), 121-123° (6) [from RMgCl by reactn. with phenyl isocyanate (3)].
- p-Acetamino-(β-chloro-ter-butyl) benzene: m.p. 155-156° (7). [From C by nitration, reduction, and acetylation (7).]

3:8980 4-CHLORO-2-PHENYLPHENOL

(5-Chloro-2-hydroxybiphenyl)

C₁₂H₉OCl

[See also 6-chloro-2-phenylphenol (3:1757).]

Important Note: Through the year 1944 (and perhaps in some cases beyond) the chlorophenyl-phenol of m.p. $+ 11^{\circ}$ ($\tilde{\mathbb{C}}$) was regarded as having the structure 6-chloro-2-phenylphenol = 3-chloro-2-hydroxybiphenyl. In 1945, however, this view was corrected by the paper of Weissberger and Salminen (3); in this text, therefore, expression of the facts is reported in the light of their paper. Particular care is, therefore, required in consulting references prior to it since such material is universally expressed in the reverse sense of the present view.

[For prepn. of \bar{C} from 2-hydroxybiphenyl (1:1440) with Cl_2 (note that 6-chloro-2-phenylphenol (3:1757) is also formed) see (1) (4) (3), for prepn. of C from 5-amino-2-hydroxybiphenyl (5) by diazotization and use of Cu₂Cl₂ reaction (27% yield (3)) see indic. refs.]

C is sol. in aq. 25% NaOH at 60° but on cooling seps. NaA.4H₂O, m.p. 84-85° (1); anhydrous NaA, m.p. 280° (1) (4) (for use in sepn. of C from the isomeric 6-chloro-2phenylphenol (3:1757) see (1). [For form. of NaA in org. solvents such as MeOH, ether, or toluene see (8).1

The calcium salt of \bar{C} is more sol. in aq. than the corresp. deriv. of the isomeric 6-chloro-2-phenylphenol (3:1757) (use in sepn. (2)).

C on mononitration with HNO₃ in AcOH at 15-20° as directed gives (48% yield (3)) 5-chloro-2-hydroxy-3-nitrobiphenyl, yellow ndls., m.p. 57-58° (3).

[C on condensation with formaldehyde + morpholine yields (6) a prod. m.p. 125-126° (6).]

---- 4-Chloro-2-phenylphenyl benzoate: m.p. 86-87° (7). [Note that this prod. does not distinguish C from the isomeric 6-chloro-2-phenylphenol (3:1757) whose benzoate has m.p. 88.5°.1

CHAPTER XX

DIVISION C. LIQUIDS WITH BOILING POINTS REPORTED ONLY UNDER REDUCED PRESSURE

3:9000-3:9299 (C₃-C₅ inclusive)

(Arranged in sequence of empirical formulas)

3: 9030 MALONYL DICHLORIDE
$$O=C-CH_2-C=O$$
 $C_3H_2O_2Cl_2$ Beil. II - 582 $II_{1^-}(252)$ $II_{2^-}(529)$

B.P. 58° at 27 mm. (1) (2) (3) $D_4^{22.9} = 1.4505$ (4) $n_D^{23.4} = 1.45973$ (4) 58° at 26 mm. (4) $D_4^{20} = 1.4509$ (5) $D_4^{20} = 1.4509$ (5) $D_4^{20} = 1.4509$ (5) $D_4^{20} = 1.4509$ (6) $D_4^{20} = 1.4639$ (7) at 15 mm. (6) $D_4^{20} = 1.4639$ (7) $D_4^{20} = 1.4639$ (8) $D_4^{20} = 1.4639$ (8) $D_4^{20} = 1.4639$ (9) $D_4^{20} = 1.4639$ (1) $D_4^{20} = 1.4639$ (1) $D_4^{20} = 1.4639$ (1) $D_4^{20} = 1.4639$ (2) $D_4^{20} = 1.4639$ (3) $D_4^{20} = 1.4639$ (4) $D_2^{20} = 1.4639$ (5) $D_4^{20} = 1.4639$ (5) $D_4^{20} = 1.4639$ (5) $D_4^{20} = 1.4639$ (6) $D_4^{20} = 1.4639$ (7) at 13 mm. (4)

Colorless liq. turning dark red on stdg. (6).

[For prepn. of \tilde{C} from malonic acid (1:0480) with SOCl₂ (yield 70% (8), 60% (6), 50% (9)) (1) (2) or with PCl₅ (yield: 68% (3), 36% (7)) see indic. refs.; for formn. of \tilde{C} from carbon suboxide with dry HCl gas see (10); for mfg. of \tilde{C} from methylene dichloride (3:5020) with CO, COS, or COCl₂ (3:5000) + cat. at 700° see (11).]

[\bar{C} in ether or EtOAc with Ag₂O, PbO, ZnO, etc., yields (8) carbon suboxide, b.p. +7°; \bar{C} treated at 0° with dry HBr gas yields (12) malonyl dibromide, b.p. 55–57° at 11 mm. (12); \bar{C} on cat. hydrogenation as specified (13) yields a condensation prod., m.p. 83°, of formyl-glutaconic acid.]

[C with acetone + CaCO₃ yields (14) mainly CH₃.CO.CH₂.CO.CH₂.CO.Cl [Beil. III₁-(263)] + a little phloroglucinol (1:1620) (the acid chloride itself, however, is quant. conv. to phloroglucinol by further htg. with CaCO₃).]

[\bar{C} with AlCl₃ + C₆H₆ yields (1) dibenzoylmethane (1:1480), m.p. 78°; for reactn. of \bar{C} with AlCl₃ + naphthalene (1:7200) yielding (15) (16) peri-naphthindandione (1,8-malonylnaphthalene) [Beil. VII₁-(391)] see indic. refs.; for reactn. of \bar{C} with acenaphthene (1:7225) yielding (15) (17) peri-acenaphtheneindandione (5,6-malonylacenaphthene) which on oxidn. gives (17) (18) naphthalene-1,4,5,8-tetracarboxylic acid [Beil. IX-1002, IX₁-(437)] see indic. refs.]

 \tilde{C} with 4 moles phenylhydrazine yields (2) malon-bis-(β -phenylhydrazide) [Beil. XV-272], m.p. 184° (2); \tilde{C} with 2 moles ethyl carbamate (urethane) in C_6H_6 refluxed until HCl is no longer evolved gives (85% yield {19}) malonyl-diurethane, cryst. from alc., m.p. 124° (19).

 $\tilde{\mathbf{C}}$ on hydrolysis with aq. yields malonic acid (1:0480). [Note that the half acid chloride of malonic acid has m.p. 65° dec. (20).] — For the amide, anilide, p-toluidide, and other derivs, corresp. to $\tilde{\mathbf{C}}$ see malonic acid (1:0480).

81° 80.9°	at 0.5 mm. at 0.53 mm.			

[See also 2-chloropropanediol-1,3 (glycerol β-monochlorohydrin) (3:9039).]

 \bar{C} is misc. with aq.; eas. sol. alc., ether, but alm. insol. pet. ether. — [For f.p./compn. data and diagram of system \bar{C} + aq. over range 0-60% \bar{C} see (19).]

USES OF C

The manifold uses of \bar{C} both as solvent and chemical intermediate cannot here be treated in detail [note, however, the following: for use of \bar{C} (sometimes together with ethylene glycol (1:6465) as solvent in nitration of various carbohydrates and related prods. see (20) (21); in cellulose nitrate lacquers see (22); in extraction of ligroin from spruce wood see (23); as rodent poison see (24)].

BIOCHEMICAL BEHAVIOR OF C

[For study of action of C on amylase (25), for effect on fermentation (26), for bactericidal action (27) (28) see indic. refs.]

PREPARATION OF C

 $\ddot{\mathbf{C}}$ may be prepared from four principal starting points, viz., glycerol (1:6540), 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358), 3-hydroxy-1,2-epoxypropane (glycidol), or allyl alcohol (1:6145); also from various miscellaneous starting points. — Note that by most of these methods a small proportion, e.g., 10-15%, of glycerol β -monochlorohydrin (3:9039) is also formed.

[For best working directions for lab. prepn. of C see (29).]

From glycerol (1:6540). With HCl without other acids. The earlier methods for prepn. of C from glycerol involved merely reaction with HCl under various circumstances [e.g., from glycerol satd. with HCl gas and htd. at 100° (30) (17), or 120° (32) cf. (15), 130° (19),

or at 150-170° under reduced press. (33), or in inert solvent such as dioxane or C itself (34) see indic. refs. and also (4); from glycerol with conc. HCl (9 moles) at 85° for 4 hrs. (9% yield (35)) or at 120° under press. (36) see indic. refs.].

With HCl in presence of organic acids. The reaction of glycerol with HCl is markedly facilitated by the presence of AcOH, other org. acids, or substances which yield such acids [e.g., for prepn. of \bar{C} from glycerol + AcOH with HCl gas (29) (1) (19) (37) (38) (39a) (yields: 86% (1) (19), 66% (29)) or with conc. aq. HCl (yields: 85–88% (16), 59–63% (29), 59% (9)) cf. (37) (39b) see indic. refs.; for prepn. of \bar{C} from glycerol + other org. acids (37) (39) or + esters of org. or inorg. acids (40) see indic. refs.; note also that further reactn. of \bar{C} with HCl leads to glycerol α,α' -dichlorohydrin (3:5985)].

With other reagents. [For prepn. of \bar{C} from glycerol with S_2Cl_2 (41) or with $SOCl_2$ + pyridine (42) see indic. refs.]

From 3-chloro-1,2-epoxypropane (epichlorohydrin) (3:5358). [For prepn. of \overline{C} from epichlorohydrin with aq. at 100° (43) in s.t. (38) (31) or in s.t. at 125° (3) or on reflux. for 14 hrs. (80% yield (7)) see indic. refs.; this ring opening is greatly facilitated by pres. of dil. acids such as dil. H₂SO₄ (yields: 85-90% (44) (6), 80% (45)) or formic acid (66% yield (46)); for study of kinetics of this reactn. incl. influence of various acids and salts see (43) (3) (47) (48); for patent on use of dil. acids or acid-reacting salts see (49).]

From 3-hydroxy-1,2-epoxypropane (glycidol = epihydrin alc.). [For prepn. of \tilde{C} from glycidol with HCl (by oxide ring opening and addn.) under a wide variety of conditions see (4) (3) (50); yields may run as high as 90% (4).]

From allyl alcohol (1:6145) by addn. of HOCl. [For formn. of \bar{C} (together with glycerol β -monochlorohydrin (3:9039)) from allyl alc. by addn. of HOCl see text and corresp. citations under the β -isomer (3:9039).]

From miscellaneous starting points. [For prepn. of \bar{C} from propylene by addn. of HOCl see (51); from glyceryl triesters of hydroxy acids (e.g., castor oil) with HCl under various conditions see (52); from glycerol α -monochlorohydrin diacetate (3:6840) by alcoholysis with MeOH/HCl at 60° for 6 hrs. (yields: 86% (13), 81-85% (14)) see indic. refs.; from the reaction prod. of \bar{C} with acetone, i.e. from 4-(chloromethyl)-2,2-dimethyl-1,3-dioxolane (see below), by acid hydrolysis see (9) (5).]

CHEMICAL BEHAVIOR OF C WITH INORGANIC REACTANTS

Reduction of C. [C in aq. soln. with Na/Hg shaken 2 days at room temp. gives (53) cf. (31) propylene glycol (propanediol-1,2) (1:6455); note that reduction of C with conc. HI (which might be expected to yield isopropyl iodide) is so slow as to be useless for detn. of C (58).]

Oxidation of \tilde{C} . $[\tilde{C}$ in aq. soln. on oxidn. with conc. HNO₃ as directed (54) gives (yield not stated) β -chloro- α -hydroxypropionic acid (β -chlorolactic acid) [Beil. III-286, III₁-(110), III₂-(209)], eas. sol. aq., alc., ether, cryst. from C₆H₆ (54), m.p. 77° (54), 77-78° (55); for resolution of this acid into opt. act. forms, d-form, m.p. 91.5°, see (56). — For oxidation of \tilde{C} with HIO₄ giving (50% yield) chloroacetaldehyde hydrate (3:7212) see (146).]

[For study of inflammability of \bar{C} with solid KMnO₄ see (57); for titration of \bar{C} with Pb(OAc)₄ and use in detn. of \bar{C} in pres. of the isomeric glycerol β -monochlorohydrin (3:9039) see (12).]

Behavior of \tilde{C} with alkalies. \tilde{C} in the pres. of alkalies may react in at least two ways according to conditions: i.e., \tilde{C} may either undergo hydrolysis yielding glycerol (1:6540) or loss of HCl and consequent ring closure yielding 3-hydroxy-1,2-epoxypropane (epihydrin alc. = glycidol).

Hydrolysis of \bar{C} . [\bar{C} with aq. under reflux is slowly (33% in 70 hrs. (59)) hydrolyzed to

glycerol. — Č with aq. alk. (60) (61) (62) or alk. carbonate (61) (62) cf. (63) hydrolyzes to glycerol; for study of kinetics of alk. hydrol. see (60) (3) (4) (64) (65). — Note that Ç with alc. NaSH (66) or KSH (67) gives monothioglycerol [Beil. I-519].]

Dehydrochlorination of \bar{C} . [\bar{C} with alc. NaOH (68) (43) (4), or alc. KOH (16), or alc. NaOEt (16), or \bar{C} in dry ether with Na (16) (63) (50) (71), or \bar{C} with Na₂CO₃ + CaSO₄ (63), or \bar{C} in ether with BaO (31), or \bar{C} with 2 N aq. NaOH at ord. temp. for 10 min. (69), or \bar{C} with basic cpds. in alc. + C₆H₆ (70) gives (yields: 66% (68), 60–90% (16), 67% (4) 55% (71), 50–60% (63), 37% (43)) 3-hydroxy-1,2-epoxypropane (glycidol) [Beil. XVII-104, XVII₁-(50)], b.p. 160–161° (50), 65–66° at 2–25 mm (16), D_-^{25} = 1.1143 (16), n_D^{25} = 1.4302 (16) (corresp. N-phenylcarbamate, m.p. 60° (16); N-(α -naphthyl) carbamate, m.p. 102° (16)).

[Note that \tilde{C} in dil. aq. alk. loses HCl to give glycidol very much more rapidly (3) (4) than does the isomeric glycerol β -monochlorohydrm; for use of this property in detn. of purity of samples of \tilde{C} see (9).]

Behavior of C with salts of inorganic acids (for NaCN see below under salts of organic acids).

With alkali (or alk.-earth) volutes. [\bar{C} with alkali iodides (72a) or alk.-earth iodides (72b) at not above 90° in absence of light gives 3-iodopropanediol-1,2 (glycerol α -iodohydrin) [Beil. I₁-(246), I₂-(539)], m.p. 48-49° (72) (73), 49-50° (7) (corresp. bis-(p-nitrobenzoate), m.p. 102° (74), 102-103° (75)), note that this prod. comprises the pharmaceutical "Alival" (74) (75).]

With alkali phosphates. $[\bar{C}$ with aq. K_3PO_4 (76) or Na_3PO_4 (76) (77) cf. (78) (82) gives the di alkali salts of glycerol α -phosphoric acid [Bell. I-517, $I_{1-}(274)$, $I_{2-}(592)$].]

With alkali arsenites [For analogous behavior of C with Na₃AsO₃ see (79)]

Behavior of \tilde{C} with NH₃. \tilde{C} with NH₃ might be expected to yield 3-aminopropanediol-1,2; however, this prod. although known, is usually prepared from other sources. [For comments on reactn. of \tilde{C} with NH₃ see (80) (81).]

CHEMICAL BEHAVIOR OF C WITH ORGANIC REACTANTS

BEHAVIOR WITH ORGANIC HYDROXY COMPOUNDS

With monohydric alcohols. \tilde{C} with monohydric alcs. in pres. of corresp. alkoxide splits out alkali chloride giving the corresp. glycerol α -monoalkyl ethers.

[$\bar{\mathbf{C}}$ with MeOH/NaOMe gives (1) (83) (84) glycerol α -methyl ether (3-methoxypropanediol-1,2) [Beil. I-512, I₁-(271), I₂-(589)], b.p. 220° at 760 mm. (1) (15), 196° at 728 mm. (83), 135.5-136° at 40 mm (1) (15), 111-112° at 13 mm. (85), $D_4^{25} = 1.111$ (1) (15), $D_4^{17} = 1.1189$ (85), $n_D^{25} = 1.442$ (1) (15), $n_D^{17} = 1.4445$ (85) (corresp bis-(p-nitrobenzoate), m.p. 108° (86) (87) (15), corresp. bis-(N-phenylcarbamate), m.p. 118-119° (87)). — Note differences of these constants from those of the isomeric glycerol β -methyl ether (2-methoxy-propanediol-1,3) [Beil. I₂-(589)], viz., b.p. 232° at 760 mm. (1) (15), 148° at 40 mm. (1) (15), $D_4^{25} = 1.124$ (1) (15), $n_D^{25} = 1.446$ (1) (15) (corresp. bis-(P-nitrobenzoate), m.p. 155° (87) (15), corresp. bis-(P-phenylcarbamate), m.p. 102° (87)); note also that m.p.'s of mixts. of the two bis-(P-nitrobenzoates) (86) and of the two bis-(N-phenylcarbamates) (87) are depressed.]

[Č with EtOH/NaOEt gives (75% yield (1)) (88) glycerol α -ethyl ether (3-ethoxypropanediol-1,2) [Beil. I-512, I₂-(590)], b.p. 222° at 760 mm. (1) (15), 118-121° at 21 mm. (88), 114-116° at 10 mm. (15), 112-113° at 10 mm. (1); $D_4^{25} = 1.063$ (1), 1.058 (15); $n_D^{25} = 1.440$ (15), $n_D^{20} = 1.441$ (1) (corresp. bis-(N-phenylcarbamate), m.p. 103-104° (88)).]

[C with n-PrOH/NaO-n-Pr gives (88) (84) glycerol α-n-propyl ether (3-(n-propoxy)pro-

panediol-1,2) [Beil. I_1 -(272)], b.p. 122° at 22 mm. (84), 118-122° at 15 mm. (88), $D_4^{18} = 1.074$ (88), $D_5^{18} = 1.4400$ (88) (corresp. bis-(N-phenylcarbamate), m.p. 116° (88)).]

[\bar{C} with n-BuOH/NaO-n-Bu gives (88) glycerol α -n-butyl other (3-(n-butoxy))propanediol-1,2), b.p. 138-140° at 22 mm., $D_4^{18}=1.002, n_D^{18}=1.4463$ (corresp. bis-(N-phenylcarbamate), m.p. 94-95°).]

Certain of the glycerol α -monoalkyl ethers contg. long-chain alkyl radicals have special interest because of their occurrence in natural prods. Two such cases are represented by glycerol α -n-hexadecyl ether (chimyl alcohol) and glycerol α -n-octadecyl ether (batyl alcohol).

[\bar{C} with Na *n*-hexadecyl oxide fails (88), however, to yield $d_i l$ -glycerol α -*n*-hexadecyl ether (chimyl alcohol) [Beil. I₂-(590)], but prepns. by other methods (89) show following props.: m.p. 62-63° (89) (corresp. bis-(p-mtrobenzoate), m.p. 52-53° (89); corresp. bis-(N-phenylcarbamate), m.p. 92° (89)).]

[\ddot{C} with Na *n*-octadecyl oxide fails (88) to yield d,l-glycerol α -n-octadecyl ether (batyl alcohol) [Beil. I₂-(590)], but prepns by other methods (91) (89) (88) show following props.: m.p. 71-71.5° (89), 70-71° (91) (90) (89) (88) (corresp. bis-(p-nitrobenzoate), m.p. 73.5-74° (89); corresp. bis-(N-phenylcarbamate), m.p. 94.5-95° (89), 95-96° (88)).]

With polyhydric alcohols. $[\bar{C}$ with cellulose + NaOH gives (92) completely aq. soluble cellulose ethers; note, however, that the press of as little as 1% of 1,3-dichloropropanol-2 (glycerol α, α' -dichlorohydrin) (3:5985) suffices to render the ether completely aq. insoluble. — For use of \bar{C} in etherification of starch (93) (94), dextrin (94), etc., see indic. refs.]

With monohydric phenols. \tilde{C} with the sodium salts of monohydric phenols splits out NaCl yielding the corresp. glycerol α -aryl ethers.

[\bar{C} with phenol (1:1420) in EtOH/NaOEt (95), or \bar{C} with phenol + solid NaOH at 120° (96) (97), or \bar{C} with phenol + aq. NaOH at 100° for 2 hrs. (98) gives (yields: 61-64% (95), 59% (96)) glycerol α -phenyl ether (3-phenoxypropanediol-1,2) [Beil. VI-149, VI₁-(85)], m.p. 70° (95), 69° (99), 67-68° (96); note that this prod. on fusion changes to a second form, m.p. 53-54° (96) (97), but on stdg. at room temp. m.p. rises again to 68°.]

Corresponding condensations of \bar{C} with many other phenols are known but cannot be included here.

BEHAVIOR WITH CARBONYL COMPOUNDS

Č with carbonyl cpds. under appropriate conditions yields the corresp. cyclic acetals (see also under corresp. subheading of epichlorohydrin (3:5358).

With aldehydes. [\bar{C} with aq. formaldehyde soln. ("formalin") (1:0145) + H_3PO_4 on htg. gives (100) 4-(chloromethyl)-1,3-dioxolane [Beil. XIX-8, XIX₁-(610)], b.p. 126° at 750 mm. (100). — Note, however, that \bar{C} with paraformaldehyde (1:0080) + dry HCl gas reacts differently giving (101) 3-chloro-1,2-bis-(chloromethoxy) propane, although no constants on this prod. appear to have been reported.]

[C with acetaldehyde (1:0100) directly seems not have been recorded (cf. under epichlorohydrin (3:5358)): note, however, that \bar{C} with acetylene in pres. of HgSO₄ at 60-80° (102) or in pres. of BF₃/HgO/MeOH (103) gives (72% yield (103)) 4-(chloromethyl)-2-methyl-1,3-dioxolane [Beil. XIX₁-(610)], b.p. 148° (102), 147-149° (103), $D_4^{24} = 1.1720$ (103), $n_D^{24} = 1.4410$ (103).]

With ketones. [C with acetone (1:5400) in pres. of HCl (5), P_2O_5 (5), HCl + Na₂SO₄ (7), or H₂SO₄ + Na₂SO₄ (9) gives (60% yield (7)) 4-(chloromethyl)-2,2-dimethyl-1,3-dioxolane ("acetone-glycerol α -chlorohydrin"), b.p. 157° at 767 mm., $D_4^{20} = 1.1079$, $n_D^{15} = 1.43750$ (7). — Note that this condensation occurs more readily than for the corresp. isomeric glycerol β -monochlorohydrin (3:9039) q.v. and has been employed (5) to enrich the proportion of the latter in mixtures of the two.]

[C with hexanone-2 directly has not been studied, but C with *n*-butylacetylene (1:8055) in pres. of Et₂O.BF₃/HgO/MeOH/trichloroacetic acid gives (104) 4-(chloromethyl)-2-*n*-butyl-2-methyl-1,3-dioxolane, b.p. 109° at 25 mm.]

[C with acetophenone (1:5515) in pres. of H₂SO₄ or HCl gives (105) a prod. presumably 4-(chloromethyl)-2-methyl-2-phenyl-1,3-dioxolane, b.p. 153-153.3° at 40 mm., which with

2 N HCl at 60° is hydrolyzed into its original components.]

BEHAVIOR OF C WITH SALTS OF ORGANIC ACIDS

 \bar{C} reacts with salts of organic acids to give in general the corresp. glycerol α -esters.

With salts of aliphatic monobasic acids. [\bar{C} with Na formate on htg. is claimed to yield (106) (45) glycerol α -monoformate [Beil. II-24, II₁-(19), II₂-(33)], but owing to the instability of this prod. the reliability of its supposed constants has been questioned (8).]

[\bar{C} with NaOAc or KOAc in s.t. at 150–160° yields (107) glyceryl α -acetate [Beil. II-146, II₁-(69), II₂-(159)], b.p. 129–131° at 3 mm., $D_4^{20}=1.2060$, $n_D^{20}=1.4517$ (108), but the reactn. is accompanied by some formn. of glyceryl diacetate and glyceryl triacetate.]

[For corresp. reactions of \bar{C} with sodium salts of *n*-butyric acid (1:1035), isobutyric acid (1:1030), *n*-valeric acid (1:1060), isovaleric acid (1:1050), and *n*-caproic acid (1:1130) see (8).

[\bar{C} with K laurate in s.t. at 180° under CO₂ (109) or \bar{C} with Na laurate at 130° (110) gives glyceryl α -laurate (" α -monolaurin") [Beil. II-362, II₁-(157), II₂-(320)], m.p. 63° (111), cf. (112), 62° (2).]

[\bar{C} with K myristate in s.t. at 180° under CO₂ (109), or \bar{C} with sodium myristate at 110–115° for 8–10 hrs. (110), gives (70% yield (110)) glyceryl α -myristate (" α -monomyristin") [Beil. II-366, II₁-(162), II₂-(327)], m.p. 68° (109) (113), 67.3° (111) cf. (112).]

[\bar{C} with K palmitate in s.t. at 180° under CO₂ (109), or \bar{C} with Pb palmitate at 112° under CO₂ (113), gives (50% yield (113)) glyceryl α -palmitate (" α -monopalmitin") [Beil. II-373, II₂-(338)], m.p. 74-75° (2), 77° (111) cf. (112).]

[\bar{C} with K stearate in s.t. at 180° under CO₂ (109), or \bar{C} with sodium stearate at 110–115° for 8–10 hrs. (110) cf. (114), gives glyceryl α -stearate (" α -monostearin"), m.p. 81.1° (111) cf. (112).]

With salts of amino acids. [For analogous forms. of corresp. glyceryl mono esters from \tilde{C} with sodium salts of aminoacetic acid (glycine) (115), α -aminopropionic acid (alanine) (115), α -amino-isocaproic acid (leucine) (116) see indic. refs.]

With alkali cyanides. [\bar{C} in 95% alc. with aq. KCN (or NaCN) in s.t. at 100° for 36 hrs., followed by hydrolysis, gives (9) 28% yield of the lactone of β , γ -dihydroxy-n-butyric acid (β -hydroxy-n-butyro- γ -lactone), m.p. 22.5-26° (9), accompanied by (23% yield (9)) the lactone of γ -hydroxyisocrotonic acid, m.p. +5° (9) (presumably formed by loss of H₂O from the former).] Cf. behavior of "glycerol β -monochlorohydrin" (3:9039).

BEHAVIOR OF Č WITH OTHER NON-NITROGENOUS ORGANIC REACTANTS

With alkyl halides (or their equivalents). [\bar{C} with MeI + silver oxide (15), or \bar{C} with methyl p-toluenesulfonate at 150° for 5 hrs. (117), or \bar{C} with diazomethane (118) gives the corresp. dimethyl ether, viz., 3-chloro-1,2-dimethoxypropane, b.p. 156-157° at 760 mm. (117), 156-158° (118), 156° (15), $D_4^{25} = 1.08$ (15), $n_2^{25} = 1.43$ (15).]

[Note that the corresp. diethyl ether, viz., 3-chloro-1,2-diethoxypropane, b.p. 69.8-70.4° at 14 mm., $D_4^{19} = 1.026$, $n_D^{20} = 1.4246$, has been prepd. indirectly (119).]

With RMgX cpds. [C with EtMgBr (2 moles) reacts in an obscure fashion yielding (120) hydroxyacetone (acetol) (1:5455). — C with iso-AmMgBr (4 moles) (perhaps acting through intermediate acetol) gives (25% yield (120)) 2,5-dimethylhexanediol-1,2 [Beil. I-491], b.p. 245-247° at 745 mm., 129-132° at 11 mm.]

[C with C₆H₅MgBr (4 moles) (perhaps acting through intermediate acetol) gives (120) (121) (60% yield (120)) 2-phenylpropanediol-1,2 [Beil. VI-930] accompanied by some 3-phenylpropanediol-1,2 [Beil. VI-929].]

BEHAVIOR OF C WITH AMINES

With primary amines. With aliphatic primary amines. [$\bar{\mathbb{C}}$ with n-heptadecylamine (122) or its hydrochloride gives a prod. which may be the expected N-(β , γ -dihydroxy-n-propyl)n-heptadecylamine.]

With aromatic primary amines. [Č with aniline (2 moles) + a little aq. refluxed for 1 hr., then neutralized, gives (63% yield (124)) $N-(\beta,\gamma-\text{dihydroxy-}n-\text{propyl})$ aniline [Beil. XII-183], b.p. 249-250° at 50 mm. (125), 200-203° (124), m.p. 42° (124), 52° (125).]

[$\bar{\mathbf{C}}$ with p-aminophenol gives (126) $N-(\beta,\gamma-\text{dihydroxy-}n\text{-propyl})-p$ -aminophenol, m.p. 192°, used as photographic developer (127); for analogous reactions of $\bar{\mathbf{C}}$ with p-anisidine giving $N-(\beta,\gamma-\text{dihydroxy-}n\text{-propyl})-p$ -anisidine, m.p. 75–76° see (126), or of $\bar{\mathbf{C}}$ with p-phenetidine giving $N-(\beta,\gamma-\text{dihydroxy-}n\text{-propyl})-p$ -phenetidine, m.p. 93° (126), 90–92° (128), see indic. refs.]

With secondary amines. With aliphatic secondary amines. [\bar{C} with Me₂NH + aq. NaOH at 20–40° (129) or \bar{C} with Me₂NH in s.t. at 100° for 5–6 hrs. (130) (131) cf. (132) gives 3-(dimethylamino)propanediol-1,2 [Beil. IV-302], b.p. 220° cor. at 749 mm. (130), 111° at 15 mm. (132). — \bar{C} with Et₂NH in s.t. at 100° for 5–6 hrs. (131) cf. (130) (132) gives 3-(diethylamino)propanediol-1,2 [Beil. IV-302], b.p. 233–235° at 748 mm. (130) (131), 106° at 3 mm. (132) (corresp. bis-(N-phenylcarbamate), m.p. 106.5° (133); corresp. bis-(N-phenylcarbamate)monohydrochloride, m.p. 109° (133)).]

With heterocyclic secondary amines. [$\bar{\mathbb{C}}$ with piperidine in s.t. at 100° for 4–5 hrs. (131, cf. (132) or in ord. flask at 100° for 1½ hrs. (134) gives 3-(piperidino)propanediol-1,2 [Beil. XX-34, XX₁-(12)], m.p. 83° (135) (132), 79–80° (136), 67–68° (134) (corresp. bis-(p-nitrobenzoate), m.p. 108° (135); corresp. bis-(N-phenylcarbamate)monohydrochloride ("Diothane"), m.p. 201–202° cor. (137), 197–198° u.c. (?) (133)). — Note that in prepn. of "Diothane" the influence of the purity of the piperidine has been studied (137); that 3-(piperidino)propanediol-1,2 yields a mono-(N-phenylcarbamate)monohydrochloride, m.p. 176–177° (133); for resolution of d,l-3-(piperidino)propanediol-1,2 into its opt. act. enantiomorphs and prepn. of the corresp. opt. act. "Diothanes" see (138).]

With tertiary amines. [\bar{C} with Me₃N anhydrous (139) or in aq. soln in s.t. at 100° for 8 hrs. (31) or in alc. soln. in s.t. at 100° for 6 hrs. (140) gives trimethyl- $(\beta,\gamma$ -dihydroxy-n-propyl)-ammonium chloride [Beil. IV-302]. — \bar{C} with Et₃N in s.t. at 100° for 8 hrs. gives (141) triethyl- $(\beta,\gamma$ -dihydroxy-n-propyl)-ammonium chloride [Beil. IV-303]. — For analogous behavior of \bar{C} with tri-n-propylamine, quinoline, and strychnine see (141). — For quat. salt from \bar{C} with N,N-dimethyl "stenyl" amine see (142).]

BEHAVIOR OF C WITH OTHER NITROGENOUS ORG. REACTANTS

[$\tilde{\mathbf{C}}$ with diazomethane gives (118) the corresp. dimethyl ether for which see above under behavior of $\tilde{\mathbf{C}}$ with alkyl halides.]

[C with aq. Na₂NCN stood for 12 hrs., then shaken with benzoyl chloride, gives (143) the tribenzoate, m.p. 130° of 5-(hydroxymethyl)-2-aminooxazoline; substitution of benzene-sulfonyl chloride for the benzoyl chloride yields (144) corresp. *tris*-(benzene-sulfonate), m.p. 158°.] Cf. behavior of epichlorohydrin (3:5358).

[—] Glycerol α -monochlorohydrin α' -acetate (γ -chloro- β -hydroxy-n-propyl acetate): b.p. 240° (see 3:6775).

- Glycerol α -monochlorohydrin β -acetate (β -chloro- β '-hydroxy-isopropyl acetate): b.p. 218° (see 3:6517).
- —— Glycerol α -monochlorohydrin α,β -diacetate: b.p. 245° (see 3:6840).
- —— Glycerol α -monochlorohydrin α' -benzoate: unreported.
- —— Glycerol α -monochlorohydrin β -benzoate: unreported.
- Glycerol α -monochlorohydrin α', β -dibenzoate: unreported.
- © Glycerol α -monochlorohydrin di-(p-nitrobenzoate): m.p. 108-109° u.c. (14), 108° (15), 107-108° (2). [From \bar{C} with p-nitrobenzoyl chloride (2 moles) in pyridine at room temp. for several days (93-96% yield (14)) or in CHCl₃ soln. with quinoline as acid acceptor (100% yield (2)); note that this prod. depresses m.p. (121-122°) of the corresp. deriv. of the isomeric glycerol β -monochlorohydrin (3:9039) (14).]
- Glycerol α -monochlorohydrin α' -(?)-(N-phenylcarbamate): m.p. 128-129° (16), 127-129° (9), 126° (42). [From \bar{C} with phenyl isocyanate in 7% yield (9); note that for the corresp. deriv. of glycerol β -monochlorohydrin (3:9039) the m.p. is 133-136°.]
- **D** N- $(\beta, \gamma$ -dihydroxy-n-propyl)phthalimide: m.p. 111.5-112.5° (145), 111° (46). [From \bar{C} with K phthalimide (100% yield (46)), but no details of conditions are stated.]

 at 18 mm. (1) (2)] $D_{4}^{20} = 1.3219$ (4) $n_{D}^{20} = 1.4831$ (4) $124.5-125^{\circ}]$ at 14.5 mm. (3) 1.3217 (3) 1.3217 (3) $cf.$ (4) $122.5-123.5^{\circ}]$ at 13.5 mm. (5) $D_{4}^{0} = 1.3416$ 1.3375 (3)

Attention is directed to the fact that \bar{C} is in most respects extremely similar in physical constants and chemical behavior to the isomeric glycerol α -monochlorohydrin (3-chloropropanediol-1,2) (3:9038); that \bar{C} is very readily partially isomerized to the latter, and that, therefore, the homogeneity of all prepns. of \bar{C} or reactn. prods. derived from supposedly pure \bar{C} must be accepted with reserve. The literature of the two glycerol monochlorohydrins is seriously entangled, and reference to the original articles must be made for supporting details.

PREPARATION OF C

Č has been isolated (3) from the mixed glycerol monochlorohydrins by fractional hydrolysis and distillation; this isolation has been confirmed (4) (6) by methods based on the slower condensation of \bar{C} with acetone (see below). — The mixture of glycerol monochlorohydrins obtd. from glycerol (1:6540) with conc. HCl at 120° for 5 hrs. under press. contains (4) 13% \bar{C} .

[For formn. of \bar{C} (together with the isomeric α -monochlorohydrin) from a mixt. of monochlorohydrin diacetates with abs. MeOH contg. dry HCl gas see [7].]

[The mixture of the two glycerol monochlorohydrins obtd. from allyl alcohol (1:6145) by addn. of HOCl (1) (8) (5) cf. (6) (9) (10) (11) (13) or from epichlorohydrin (3:5358) q.v. by addn. of aq. in pres. of acids has been shown (12) to be essentially similar to that obtd. from glycerol with HCl, although different proportions of α - and β - isomers might be anticipated (3).]

CHEMICAL BEHAVIOR OF C

Reduction of \tilde{C} . [\tilde{C} with Na/Hg in aq. alc. HCl gives (8) trimethylene glycol (1:6490).] Behavior with aq. alkalies. [\tilde{C} with aq. alk. loses HCl and ring-closes to 3-hydroxy-1,2-epoxypropane (glycidol = epihydrin alcohol): this reactn. occurs with \tilde{C} very much more slowly than for the isomeric α -monochlorohydrin (3:9038); for its use in detn. of purity of \tilde{C} see (6) (3) (13) (14).]

Behavior with alkali cyanides. [\bar{C} in 95% alc. with aq. KCN (or NaCN) in s.t. at 100° for 36 hrs., followed by hydrolysis, does not (6) give the expected $\beta_1\beta'$ -dihydroxyisobutyric acid but instead gives (35% yield (6)) the lactone of $\beta_1\gamma$ -dihydroxy-n-butyric acid (β -hydroxy-n-butyro- γ -lactone), m.p. 22.5–26° (6), i.e., the same prod. similarly obtd. from glycerol α -monochlorohydrin (3:9038).]

Behavior with NaI. [\bar{C} with dry NaI in anhydrous acctone in s.t. at 100° for 12 hrs. gives (18% yield (15)) glycerol β -mono-iodohydrin, m.p. 52-53° (15).]

Behavior with acetone. [\bar{C} in acetone with P_2O_5 at 2-7° gives (57% yield (4)) a condensation prod., "acetone- β -chlorohydrin," $C_6H_{11}O_2Cl$, b.p. 161.5-162.2° cor. at 757 mm., $D_4^{15}=1.1344$, $n_D^{15}=1.4487$; this condensation occurs less readily, however, than the analogous reactn. for glycerol α -monochlorohydrin (3:9038), and removal of the latter by this means has been used (4) to enrich the proportion of \bar{C} in a mixt. of the two.]

- Glycerol β -monochlorohydrin α -acetate: oil, b.p. 230° at 760 mm., 230–234° cor. at 750 mm. (10), $D_{15}^{15} = 1.235$ (10). (See 3:6648.)
- Glycerol β -monochlorohydrin $\alpha_1\alpha'$ -diacetate: oil, b.p. 101–102° at 4 mm. (15).
- —— Glycerol β -monochlorohydrin α -benzoate: unreported.
- Glycerol β -monochlorohydrin α,α' -dibenzoate: oil, b.p. 210-211° at 1.5 mm. (15).
- Glycerol β-monochlorohydrin α,α'-bis-(p-nitrobenzoate): m.p. 121-122° (16) (7).
 [Prepd. indirectly; note that this prod. depresses the m.p. of authentic glycerol α-monochlorohydrin bis-(p-nitrobenzoate), m.p. 108-109° u.c. (7).]
- Glycerol β -monochlorohydrin α -(N-phenylcarbamate): m.p. 133-136° (6), 131-133° remelting at 133° (12). [From \bar{C} with phenyl isocyanate in 6% yield (6); note that, for the corresp. deriv. of glycerol α -monochlorohydrin, m.p. is 128-129° (12).]

3:9098-A METHYL (CHLOROFORMYL)ACETATE
$$C_4H_5O_3Cl$$
 Beil. II - 582 (Carbomethoxyacetyl chloride) $COOCH_3$ II₁-(252) II_2 —

B.P. 57-59° at 12 mm. (1)

[See also ethyl (chloroformyl)acetate (3:9246).]

Note that \bar{C} is both an acid chloride and an ester; it comprises the half acid chloride/half methyl ester of malonic acid (1:0480).

[For prepn. of Č from potassium salt of methyl hydrogen malonate with SOCl₂ in dry ether (68% yield) see (1).]

Č on htg. or on repeated distn. or by action of quinoline in dry ether at 0° loses HCl and undergoes condensation to methyl 6-methoxy-2,4-diketo-2,3-dihydropyran-3-carboxylate [Beil. XVIII₁-(540)], ndls. from CHCl₃, m.p. 148-150° (1) cf. (2).

- \odot ω -(Carbomethoxyacet)anilide: ndls. from ether/pet. eth., m.p. 42-43° (1). [From $\ddot{\mathbf{C}}$ with aniline (1).]
- --- ω -(Carbomethoxyacet)-p-toluidide: unreported.
- 3:9098-A (1) Staudinger, Becker, Ber. 50, 1019-1020 (1917). (2) Leuchs, Ber. 39, 2643 (1906).

B.P. 130-140° at 12 mm. (1)
$$n_{\rm D}^{25}=1.4762$$
 (3) 89° at 1.75 mm. (2) 83° at 0.8 mm. (2) $D_4^{20}=1.532$ $n_{\rm D}^{20}=1.48378$ (2) 68° at 0.025 mm. (3) 1.4775 (3)

Note that \bar{C} may react either in the ester form (A) or the dioxolane form (B) and doubtless exists as a tautomeric equilibrium of both; in this equilibrium, however, form (A) probably predominates (2), but variations in the equilibrium may account for the observed variation in n_D^{20} (see above).

Colorless odorless oil, spar. sol. aq. (2). — \bar{C} on long stdg. is claimed (2) to disproportionate to ethylene glycol bis-(trichloroacetate) (not, however, otherwise described in the literature) and ethylene glycol (1:6465). — \bar{C} on attempted distn. at usual water-pump vac. (14-17 mm.) (3) or \bar{C} in presence of a trace of pyridine (3) decomposes yielding monomeric ethylene glycol carbonate [Beil. XIX-100], m.p. 38°, and CHCl₃ (3:5050).

[For prepn. of \bar{C} from ethylene glycol (1:6465) with trichloroacetyl chloride (3:5420) in 1,4-dioxane soln. (82% yield (2)) or from ethylene oxide (1:6105) with trichloroacetic acid (3:1150) (28% yield based on latter (1) (3)) see indic. refs.]

 \bar{C} on shaking with aq. and simultaneously titrating with N/10 aq. NaOH hydrolyzes to ethylene glycol (1:6465) and trichloroacetic acid (3:1150) as shown by Sap. Eq. of 207.8 (2) (calcd. 207.5).

[\bar{C} with diazomethane (1) best in CCl₄ soln. (2) gives (yields: 78% (2), 39% (1)) the methyl ether corresp. to structure (B), viz., 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, pr. tbls. from alc., m.p. 78-78.5° (1), 77-78° (2) (4), b.p. 114-115° at 12 mm. (4), 112-113° at 10 mm. (1); this product although resistant to saponification by alkalies is hydrolyzed by dil. acids (4). — Note that the isomeric methyl ether corresponding to structure (A), viz., β -methoxyethyl trichloroacetate, although not obtainable from \bar{C} , has nevertheless been prepd. (82% yield (4)) from β -methoxyethanol (methyl "cellosolve") (1:6405 with trichloroacetyl chloride (3:5420), has quite different physical props., viz., m.p. 14.6-14.8° (4), b.p. 92-93° at 10 mm. (4), and is easily hydrolyzed (4) on shaking with aq. alone to β -methoxyethanol (1:6405) and trichloroacetic acid (3:1150). — Note also that the first of the above two methyl ethers, i.e., 2-methoxy-2-(trichloromethyl)-1,3-dioxolane, by trans-esterification with alcohols (e.g., EtOH (2), n-PrOH (4), n-BuOH (2)) can be converted to its higher homologs.]

 \bar{C} with acid chlorides gives esters corresp. to the acylic structure (A): e.g., \bar{C} with AcCl (3:7065) gives (71% yield (4)) the mixed ester, ethylene glycol acetate-trichloroacetate (β -acetoxyethyl trichloroacetate) b.p. 122° at 11 mm. (4); \bar{C} with SOCl₂ gives (70% yield (4)) β -chloroethyl trichloroacetate (3:6510).

3:9195 1-CHLORO-2-(CHLOROMETHYL)BUTADIENE-1,3
$$C_5H_6Cl_2$$
 Beil. I — CH_2Cl I_1 — CH_2 —

No physical constants on C are cited by the abstract journals.

[For formn. of C from 2-(chloromethyl)-1,2,3-trichlorobutane (3:5230) with boilg. alc. KOH (2-(chloromethyl)-1,3-dichlorobutene-1 (3:9201) is also formed) see (1),

C readily polymerizes (1).

C with maleic anhydride (1:0625) forms addn. prods. (1).

3:9195 (1) Tishchenko, J. Gen. Chem. (U.S.S.R.) 6, 1116-1132 (1936); Cent. 1937, I 573; C.A. 31, 1003 (1937).

3:9200 1-CHLORO-2-METHYLBUTADIENE-1,3 C_5H_7Cl Beil. S.N. 12 ("Isoprene monochloride") CH_3 Cl H_2C —CH—C—CH

B.P. 50.4° at 100 mm. (1)
$$D_4^{20} = 0.9710$$
 (1) $n_D^{20} = 1.4792$ (1)

Č has pleasant odor resembling isoprene.

[For prepn. of \bar{C} (38% yield (1) together with other products) from 2-methylbutadiene-1,3 (isoprene) with Cl_2 in CCl_4 see (1); for formn. of \bar{C} (30% yield (2) together with other products) from 1,2,3-trichloro-2-methylbutane (3:6100) with 2 moles of quinoline at 185– 225° see (2).]

Č with 4 pts. liq. SO₂ gives (1) 1-chloro-2-methylbutene-2 1,4-sulfone, white rhombic plates from water (which effectively separates the accompanying tar), or from ether, m.p. 73° cor. (1). [This prod. is a potent sternutator and skin irritant; its soly. in aq. is about

2.4 g. at 15° and 7.2 g. per 100 ml. aq.; in boilg. aq. it gives a tar, and aq. solns. are therefore concd. under reduced press.; on htg. to 140° under 100 mm. press. it regenerates (77% yield) \tilde{C} and thus constitutes a convenient means for storing \tilde{C} in stable form. (1).]

C polymerizes at a rate comparable to that of isoprene (for details see (1)).

Č (6 g.) + 1,4-naphthoquinone (1:9040) (3.5 g.) htd. under N₂ for 4 hrs. at 80° gives (1) on cooling 1-chloro-2-methyltetrahydroanthraquinone, pale yel. ndls. from acetone, colorless ndls. from alc., m.p. 146° cor. (1); this prod. on oxidn. with air in alc. NaOH yields 1-chloro-2-methylanthraquinone, cryst. from AcOH or alc., m.p. 171-172° cor. (1) (3) [dif. from 3-chloropentadiene-1,3 (3:7360) q.v.].

C with maleic anhydride (1:0625) evolves HCl and yields (2) a dianhydride.

3:9200 (1) Jones, Williams, J. Chem. Soc. 1934, 829-835. (2) Tishchenko, J. Gen. Chem. (U.S.S.R.) 6, 1116-1132 (1936); Cent. 1937, I 573; C.A. 31, 1003 (1937). (3) Keimatsu, Hirano, J. Pharm. Soc. Japan, 49, 140-147 (1929); C.A. 23, 3466 (1929).

[For prepn. of \bar{C} from ethyl α,β -dichloropropionate (3:6090) by htg. with dimethylaniline, quinoline, or quinaldine at 100° for 10 min. under N_2 (81% yield) see (1).

See also α -chloroacrylic acid (3:1445) and methyl α -chloroacrylate (3:9096).

3:9242 (1) Marvel, Dec, Cooke, Cowan, J. Am. Chem. Soc. 62, 3495-3498 (1940).

3: 9244 METHYL
$$\beta$$
-CHLOROCROTONATE $C_6H_7O_2Cl$ Beil. II — CH₃—C—Cl II₁-(189) II₂-(396) H—C—COOCH₃

B.P. 64–67° at 14 mm. (1) $D_4^{22\ 3}=1.1555$ (1) $D_4^{21\ 4}=1.1564$ (1) $n_D^{21\ 4}=1.46275$ (1) $D_4^{20}=1.157$ (1)

[See also methyl B-chloroisocrotonate (3:8028).]

[For prepn. of \tilde{C} from β -chlorocrotonic acid (3:2625) in MeOH (1:6120) with dry HCl see (1).]

 $[\bar{C}]$ with Na salt of benzyl mercaptan gives (2) methyl β -(benzylmercapto)crotonate, cryst. from ether and MeOH, m.p. 69–70° (2), 73° (3), also obtd. (78% yield (3)) from Na thioenolate of methyl β -mercaptocrotonate with benzyl chloride (3:8535); note that this (and also other, analogous products) are also obtd. starting with the stereoisomeric methyl β -chloroisocrotonate (3:8028) q.v.

3:9244 (1) von Auwers, Ber. 45, 2806-2807 (1912). (2) Scheibler, Voss, Ber. 53, 384 (1920). (3) Scheibler, Topouzada, Schulze, J. prakt. Chem. (2) 124, 20 (1940).

See also methyl (chloroformyl)acetate (3:9098-A).1

63-64° at 10 mm. (4)

Note that \tilde{C} is both an acid chloride and an ester; it comprises the half acid chloride/half ethyl ester of malonic acid (1:0480).

[For prepn. of Č from ethyl hydrogen malonate with SOCl₂ (3) or better from potassium ethyl malonate with SOCl₂ at 0° (1) or in ether (4) (yields: 70% (1), 45% (4)) of. (5) or with PCl₅ (6) see indic. refs.]

Č boils at ord. press. about 170–180° with serious decompn. (3). — Č on repeated distn. even under reduced press. (4) or Č with quinoline in dry ether at 0° (4) loses HCl and undergoes condensation yielding ethyl 6-ethoxy-2,4-diketo-2,3-dihydropyran-3-carboxylate [Beil. XVIII₁-(540)], cryst, from CS₂, m.p. 85–86° (4) cf. (7).

[For behavior of C with 2,4-dimethylpyrryl MgBr (8), with indolyl MgBr (5), with indolyl MgI (9), or with imidazolyl MgBr (10) see indic. refs.]

[For behavior of C with atoxyl see (1).]

[\bar{C} with urea (2 moles) reacts as an acid chloride giving (2) ethyl malonurate [Beil. III-66], m.p. 128° (2). — \bar{C} with thioformamide condenses with loss of H_2O + HCl giving (11) (12) (13) ethyl thiazole-5-carboxylate, b.p. 103.5-104.5° at 12 mm. (13), which on hydrolysis gives thiazole-5-carboxylic acid, m.p. 196-197° cor. (11).]

```
—— ω-(Carbethoxyacet)anilide: unreported.

Φ ω-(Carbethoxyacet)-p-toluidide: m.p. 83° (4).
```

3:9285 (1) Meerwein, Sönke, J. prakt. Chem. (2) 137, 319-320 (1933).

CH₂.CH₂—C—CH₃
OCI ter-AMYL HYPOCHLORITE C₅H₁₁OCl 3:9287 Beil. I — (Dimethyl-ethyl-carbinyl I_1 hypochlorite) I₂-(423) $D_4^{25} = 0.8547 (1)$ B.P. see text.

[See also ter-butyl hypochlorite (3:7165).]

Yellow mobile liquid with irritating odor and giving vapor which violently attacks eves and mucous membranes (1). — C boils with considerable decomposition; a thermometer in the vapor recorded 76° at 752 mm., but this cannot, of course, be regarded as a b.p. (1).

Č is relatively stable and even after 2 months (in dark) is practically unchanged (1); for study of stability of \bar{C} in aq. or in CCl4 see (2). — \bar{C} on exposure to bright sunlight dec. quietly with evolution of heat leaving a colorless liq. contg. acetone (1:5400) and other prods.

[For prepn. of C from ter-amyl alc. (1:6160) with Cl₂ in aq. alk. (1) (3) or alk. earth (4) or with aq. HOCl in pres. of CCl4 (90% yield (5)) (2) see indic. refs.]

 \bar{C} with KI + AcOH liberates I₂ quant. according to equation $C_5H_{11}OCl + 2HI \rightarrow$ $C_8H_{11}OH + HCl + I_2$ (use in quant. detn. of \bar{C} (1)).

[For reactn. of C with R₂C=NMgX cpds. to yield N-chloroimines see (3); for reactn. of C with Schiff's bases see (5) (6).]

3:9287 (1) Chattaway, Backeburg, J. Chem. Soc. **123**, 2999-3003 (1923). (2) Taylor, MacMullen, Gammal, J. Am. Chem. Soc. **47**, 397-398 (1925). (3) Hauser, Humble, Haus, J. Am. Chem. Soc. **54**, 2476-2480 (1932). (4) Deanesly (to Shell Development Co.), U.S. 1,938,175, Dec. 5, 1933; Cent. **1934**, I 1709; C.A. **28**, 1053 (1934). (5) Fusco, Musante, Gazz. chim. ital. **66**, 258-264 (1936); Cent. **1936**, II 2341; C.A. **31**, 1777 (1937). (6) Musante, Fusco, Gazz. chim. ital. **66**, 639-648 (1936); Cent. **1937**, I 1674; C.A. **31**, 3459 (1937).

No physical constants on C appear to be recorded.

[For prepn. of \bar{C} from 2,3-epoxy-2-methylbutane (trimethylethylene oxide) [Beil. XVII-18] by addn. of HCl see (1).]

Č passed over clay at 350° and 18 mm. pressure yields (2) 2-methylbutadiene-1,3 (isoprene) (1:8020).

3:9290 (1) Henry, Compt. rend. **144**, 311 (1907); Rec. trav. chim. **26**, 430-433 (1907). (2) Badische Anilin und Soda Fabrik, Ger. 255,519, Jan 3, 1913; Cent. **1913**, I 476.

3:9295 5-CHLOROPENTANOL-1 $CH_2.(CH_2)_3.CH_2OH$ $C_5H_{11}OCl$ Beil. S.N. 24 $(\omega$ -Chloro-n-amyl alcohol)

B.P. 114° at 16 mm. (1)

[For prepn. of \bar{C} from α, ω -pentamethylene glycol (1:6519) with SOCl₂ (35% yield (2)) or with S₂Cl₂ (35% yield (1)) see indic. refs.]

 \tilde{C} with aliphatic mercaptans has apparently not been studied. [However, 5-chloro-n-amyl acetate (see below) with MeSH in MeOH/KOH yields (1) 5-hydroxy-n-amyl methyl sulfide, b.p. 121° at 16 mm., $D_4^{20} = 0.9846$, $n_a^{20} = 1.488185$ (corresp. N-phenylcarbamate, m.p. 43.5°); this prod. with SOCl₂ gives (75% yield (3)) 5-chloro-n-amyl methyl sulfide, b.p. 94° at 15 mm., $D_4^{20} = 1.0300$, $n_D^{20} = 1.48597$. — Similarly 5-chloro-n-amyl acetate with EtSH in alc. KOH gives (68% yield (4)) 5-hydroxy-n-amyl ethyl sulfide, b.p. 135° at 20 mm.; this prod. with SOCl₂ + diethylamline in CCl₄ gives (64% yield (4)) 5-chloro-n-amyl ethyl sulfide b.p. 122° at 25 mm. (4).]

 \tilde{C} with aromatic mercaptans has apparently not been studied. [However, 5-chloro-namyl acetate (see below) with thiophenol in alc. KOH gives (1) 5-hydroxy-n-amyl sulfide, ndls. from lt. pet., m.p. 31.5° (corresp. N-phenylcarbamate, m.p. 59°); this prod. with SOCl₂ + dimethylaniline in CHCl₃ gives (3) 5-chloro-n-amyl phenyl sulfide, b.p. 174° at 14 mm., sl. dec., 140° at 1 mm., $D_4^{20} = 1.1065$, $n_D^{20} = 1.56040$.]

 \bar{C} with Et₂NH appears never to have been studied. [However, the prod. to be expected, viz., 5-(diethylamino)pentanol-1, b.p. 131° at 23-24 mm. (5), 125° at 18 mm. (6), $D_{20}^{20} = 0.8842$ (5), $n_D^{20} = 1.4642$ (5), has been reported by other means; this prod. with SOCl₂ in CHCl₃ would be expected to yield 5-(diethylamino)-n-amyl chloride, but this cannot be isolated in the free state owing to its isomerization (7) to N-ethyl 1-ethyl-2-methylpyrrolidinium chloride.]

Č with morpholine gives (8) alm. quant. 5-(4-morpholinyl)pentanol-1, b.p. 133.0-133.5° at 5 mm., $D_4^{25} = 1.005$, $n_D^{24} = 1.4755$ (corresp. N-phenylcarbamate, m.p. 55.5-57.0° cor.) (8). — Č (1 mole) with N-phenylpiperazine (2 moles) at 100° for 5 hrs. gives (2) in alm. 100% yield (as salt) N-(5-hydroxy-n-amyl)-N'-phenylpiperazine, m.p. 74.0-75.0° cor. (corresp. N-phenylcarbamate, m.p. 100.0-101.5° cor.) (2).

- 5-Chloro-n-amyl acetate: b.p. 103° at 18 mm., $D_4^{20}=1.0648$, $n_{\alpha}^{20}=1.43791$ (1). 5-Chloro-n-amyl N-phenylcarbamate: m.p. 72° (1).

CHAPTER XXI

DIVISION C. LIQUIDS WITH BOILING POINTS REPORTED ONLY UNDER REDUCED PRESSURE

3:9300-3:9599 (C₆-C₈ inclusive)

(Arranged in sequence of empirical formulas)

--- 1,2,4,4,6,6-HEXACHLOROCYCLOHEXEN- O C₆O₂Cl₆ Beil. VII - 272
1-DIONE-3,5 | VII₁--("Hexachlororesorcinol") | Cl

B.P. 159-160° at 13-15 mm.

M.P. 115°

See 3:3470. Division A: Solids.

3:9300 3,4-DICHLOROHEXATETRAENE-1,2,4,5 C₆H₄Cl₂ Beil. S.N. 14

$$\begin{array}{c} Cl & Cl \\ \downarrow & \downarrow \\ CH_2 \hspace{-0.1cm} = \hspace{-0.1cm} C \hspace{-0.1cm} = \hspace{-0.1cm} C \hspace{-0.1cm} = \hspace{-0.1cm} CH_2 \end{array}$$

$$D_4^{20} = 1.1819 (1) \quad n_D^{20} = 1.5456 (1)$$

[For prepn. of \bar{C} from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10-15° (a much larger amt. of 1,3,4-trichlorohexatriene-2,4,5 (3:9302) is also formed) see (1).]

3:9300 (1) Coffman, Carothers, J. Am. Chem. Soc. 55, 2040-2047 (1933).

3:9302 3,4,6-TRICHLOROHEXATRIENE-1,2,4 C₆H₅Cl₃ Beil. S.N. 13

B.P. 50° at 1 mm. (1)
$$D_4^{20} = 1.3132$$
 (1) $n_D^{20} = 1.5517$ (1)

[For prepn. of \bar{C} from 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306) with 15% excess KOH in abs. MeOH at 10-15° (a small amt. of 3,4-dichlorohexatetraene-1,2,4,5 (3:9300) is also formed) see (1).]

3:9362 (1) Coffman, Carothers, J. Am. Chem. Soc. 55, 2040-2047 (1933).

3:9304 3,6-DICHLOROHEXATRIENE-1,3,4 C₆H₆Cl₂ Beil. S.N. 13

B.P. 45-46° at 3 mm. (1)
$$D_4^{20} = 1.1807$$
 (1) $n_D^{20} = 1.5195$ (1) 38° at 1 mm. (1)

[For prepn. of \bar{C} from hexadien-2,5-yne-3 (divinylacetylene) (2) with Cl_2 in CCl_4 at -50° (20-25% yield together with other products) or in small yield with HOCl see (1).] \bar{C} slowly polymerizes, changing in 3 months to a viscous sirup (1).

C on cat. hydrogenation in EtOAc yields n-hexane (1:8530), b.p. 69-70° (1).

C on further treatment with Cl₂ in CCl₄ at 5-10° gives (1) 1,3,4,6-tetrachlorohexadiene-2,4 (3:9306), b.p. 85-92° at 3 mm., $D_4^{20} = 1.4902$, $n_D^{20} = 1.5458$ (1).

Č with conc. HCl contg. Cu₂Cl₂ shaken for 12 hrs. at 27° adds HCl yielding (1) 3,3,6-trichlorohexadiene-1,4 (3:9308) q.v.

 \bar{C} refluxed with stirring for 8 hrs. with 6 pts. aq. contg. 2 moles Na₂CO₃ gives (1) chloride ion corresp. to one of the two initial halogenations together with a soft sticky resin. — \bar{C} with MeOH/KOH at 10–15° or with NaOMe in dry MeOH loses 1 HCl giving excellent yield (1) of 3-chlorohexatetraene-1,3,4,5 (3:7735).

C on oxidn. with aq. KMnO4 yields (1) chloroacetic acid (3:1370).

3:9304 (1) Coffman, Carothers, J. Am. Chem. Soc. 55, 2040-2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, J. Am. Chem. Soc. 53, 4200-4202 (1931).

B.P. 84-89° at 2 mm. (1)

$$D_4^{20} = 1.4013$$
 (1) $n_{D_4}^{20} = 1.5465$ (1)

[For prepn. of \tilde{C} from hexadien-2,5-yne-3 (divinylacetylene) (2) with Cl_2 at -40° to -50° (together with other products) see (1).]

 \bar{C} treated directly with Cl_2 for 8 hrs. at 60-70° gives (23% yield (1)) 1,2,3,4,5,6-hexachlorohexene-3 (3:1220), m.p. 57-58° (1).

 \bar{C} refluxed for 8 hrs. with stirring with aq. Na₂CO₃ soln. gives (1) chloride ion corresp. to two of the initial four chlorine atoms. — \bar{C} with abs. MeOH/KOH at 10-15° loses HCl in each of two ways yielding (1) both 1,3,4-trichlorohexatriene-2,4,5 (3:9302) and 3,4-dichlorohexatetraene-1,2,4,5 (3:9300).

C on oxidn. with aq. KMnO₄ for 5 hrs. at 35-40° gives (1) chloroacetic acid (3:1370).

3:9306 (1) Coffman, Carothers, J. Am. Chem. Soc. 55, 2040-2047 (1933). (2) Nieuwland, Calcott, Downing, Carter, J. Am. Chem. Soc. 53, 4200-4202 (1931).

B.P. 110-112° at 2 mm.

M.P. 58-59°

See 3:1220. Division A: Solids.

3: 9308 3,3,6-TRICHLOROHEXADIENE-1,4 C₆H₇Cl₃ Beil S.N. 12

Cl Cl

CH₂=CH-CH-CH-CH₂

Cl

B.P. 100-103° at 4 mm. (1) $D_4^{20} = 1.3036$ (1) $n_D^{20} = 1.5585$ (1)

[For prepn. of C from 3,6-dichlorohexatriene-1,3,4 (3:9304) with conc. HCl contg. Cu₂Cl₂ by shaking for 12 hrs. at 27° see {1}.]

 \bar{C} refluxed with stirring for 7 hrs. with aq. Na₂CO₃ gives (1) chloride ion corresp. to three halogen atoms but the org. product was not identified.

C on oxidn, with alk, KMnO₄ for 4 hrs. at 30-40° yields (1) chloroacetic acid (3:1370).

3:9308 (1) Coffman, Carothers, J. Am. Chem. Soc. 55, 2040-2047 (1933).

3:9310 1,3-DICHLOROHEXADIENE-2,4

C₆H₈Cl₂ Beil. S.N. 12

(Divinylacetylene dihydrochloride)

Cl Cl CH₃—CH—CH—C—CH—CH₂

$$D_4^{20} = 1.1456 (1) \quad n_D^{20} = 1.5271 (1)$$

[For prepn. of $\bar{\mathbf{C}}$ (53% yield (1)) from divinylacetylene by shaking with 12 N HCl contg. Cu₂Cl₂ see (1).]

 $\bar{\rm C}$ refluxed with NaOAc + AcOH yields (by reactn. of one chlorine atom) 1-acetoxy-3-chlorohexadiene-2,4, b p. 84-85° at 3 mm., $D_4^{20}=1.0915, n_D^{20}=1.4890$ (1). — Similarly $\bar{\rm C}$ on htg. with MeOH/KOH yields (1) 1-methoxy-3-chlorohexadiene-2,4, n.p. 88-92° at 30 mm., $D_4^{20}=1.0239, n_D^{20}=1.4928$ (1).

 \bar{C} on oxidn. with aq. KMnO₄ in K₂CO₃ soln. gives (1) chloroacetic acid (3:1370) + acetic acid (1:1010).

Č with naphthoquinone-1,4 (1:9040) or with maleic anhydride (1:0625) gives (1) only a small amt. of dark gummy material.

3:9310 (1) Coffman, Nieuwland, Carothers, J. Am. Chem. Soc. 55, 2048-2051 (1933).

3:9312 3-CHLOROHEXADIENE-1,3

C₆H₉Cl Beil. S.N. 12

B.P. 68.2-69° at 117 mm. (1)
$$D_4^{20} = 0.9390$$
 (1) $n_D^{20} = 1.4770$ (1)

[For prepn. of \bar{C} from α -ethyl- β -vinylacetylene by shaking with conc. HCl contg. $Cu_2Cl_2 + NH_4Cl$ see (1).]

[For polymerization of \bar{C} see (1) (2).]

C on htg. with 2 pts. naphthoquinone-1,4 (1:9040) for 2 hrs. at 100° then suspended in alc. NaOH and aerated gives (1) 2-chloro-1-ethylanthraquinone, yel. ndls. from alc., m.p. 151-152° (1).

[For study of another chlorohexadiene obtd. from allyl chloride (3:7035) by actn. of NaNH₂ in liq. NH₃ see $\{3\}$.]

3:9312 (1) Jacobson, Carothers, J. Am. Chem. Soc. 55, 1624-1627 (1933). (2) Carothers, Coffman (to du Pont), U.S. 1,950,441, March 13, 1934; Cent 1934, II 1037; C.A. 28, 3270 (1934). (3) Kharasch, Nudenberg, Sternfeld, J. Am. Chem. Soc. 62, 2034-2035 (1940).

3:9314 1-CHLORO-3-METHYLPENTADIENE-1,2 C₆H₉Cl Beil. S.N. 12

B.P. 68-70° at 100 mm. (1)
$$D_4^{20} = 0.9562$$
 (1) $n_\alpha^{20} = 1.46967$ (1)

[For formn. of C from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking

with conc. HCl contg. $Cu_2Cl_2 + NH_4Cl$ see (1) (considerable 3-chloro-3-methylpentyne-1 (3:9322) is also formed).

Č on stdg. 8 months with Cu₂Cl₂, NH₄Cl, plus a few drops conc. HCl isomerized to 1-chloro-3-methylbutadiene-1,3 (3:7355) (1).

3:9314 (1) Favorskaya, Zakharova, J. Gen. Chem. (U.S.S R.) 10, 446-450 (1940); C.A. 34, 7844 (1940).

B.P. 62-63° at 100 mm. (1)
$$D_4^{20} = 0.9574$$
 (1) $n_2^{20} = 1.47714$ (1)

[For prepn. of \bar{C} from 1-chloro-3-methylpentadiene-1,2 (3:9314) by stdg. 8 months with Cu₂Cl₂, NH₄Cl, plus a few drops conc. HCl see (1).]

Č reacts with maleic anhydride (1:0625) to give a mixt. from which after hydrolysis two acids, one m.p. 218-220°, the other, m.p. 350-351°, are obtd. (1).

3:9316 (1) Favorskaya, Zakharova, J. Gen. Chem. (U.S.S R), 16, 446-450 (1940); C.A. 34, 7844 (1940).

B.P. 57-60° at 96 mm. (1)
$$D_4^{20} = 0.9437$$
 (1) $n_D^{20} = 1.4671$ (1)

[For prepn. of \bar{C} from 3-methylpenten-2-yne-4 in 22% yield (1) by shaking for 5½ hrs. at 20° with conc. HCl contg. Cu₂Cl₂ + NH₄Cl see (1).]

C on htg. with 2 pts. naphthoquinone-1,4 (1:9040) for 1 hr. at 100° gives (1) on cooling 2-chloro-3,4-dimethyltetrahydroanthraquinone, colorless ndls. from aq. acetone, m.p. 107° (1); suspension of this intermediate in dil. alc. NaOH and aeration until the purple solution becomes yellow gives (1) 2-chloro-3,4-dimethylanthraquinone, yel. cryst. from AcOH, m.p. 171.5° (1).

[For polymerization of C see (1) (2).]

3:3318 (1) Carothers, Coffman, J. Am. Chem. Soc. 54, 4075–4076 (1932). (2) Carothers, Coffman (to du Pont), U.S. 1,950,441, March 13, 1934; Cent. 1934, II 1038; C.A. 28, 3270 (1934).

3:9320 1-CHLOROHEXYNE-1
$$C_6H_9Cl$$
 Beil. S.N. 12 $CH_3.CH_2.CH_2.CH_2.CH_2.CH_2.Cl$

B.P. 47° at 55 mm. (1)
$$n_D^- = 1.43350$$
 (1)

[For prepn. of \bar{C} from hexyne-1 (1:8055) by conversion in liq. NH₃ to C₄H₉.C \equiv C \rightarrow K and treatment of this prod. in ether suspension with Cl₂ at -32° see (2) (3); for prepn. of \bar{C} from C₄H₉.C \equiv C.Na with benzenesulfonyl chloride in ether see (1) (4).]

Č in MeOH + HgO + BF₃ as specified (2) adds 2 MeOH giving in 83% yield 1-chloro-2.2-dimethoxyhexane, b.p. 77-80° at 14 mm., $D_{-}^{25} = 0.9873$, $n_{\rm D}^{25} = 1.4305$ (2).

3:9326 (1) Pflaum, Wenzke, J. Am. Chem. Soc. 56, 1106-1107 (1934). (2) Verbanc, Hennion, J. Am. Chem. Soc. 66, 1711-1713 (1938). (3) McCusker, Vogt, J. Am. Chem. Soc. 59, 1308-1309 (1937). (4) Truchet, Ann. chim. (10) 16, 309-416 (1931).

B.P. 55° at 130 mm. (1)
$$D_4^{20} = 0.9163$$
 (1) $n_D^{20} = 1.4330$ (1) (2) $51-52^\circ$ at 135 mm. (2) 0.9140 (2) $48-50^\circ$ at 100 mm. (3) 0.9141 (3) $n_\alpha^{20} = 1.42963$ (3)

[For prepn. of \bar{C} from 3-methylpentyn-1-ol-3 (ethyl-ethynyl-methyl-carbinol) by shaking with conc. HCl (40% yield (2)) best overnight (60% yield (1)); if the acid also contains $Cu_2Cl_2 + NH_4Cl$, \bar{C} is accompanied (3) by 1-chloro-3-methylpentadiene-1,2 (3:9314).] [Note that dry HCl at 0° reacts with the alc. only slightly while PCl₃ + pyridine gave a product difficult to purify (1).]

 $\bar{\mathbf{C}}$ with CH₃MgBr gives (66% yield (1)) 3,3-dimethylpentyne-1, b.p. 69° at 100 mm., $D_4^{20}=0.7610,\ n_D^{20}=1.4360;\ \bar{\mathbf{C}}$ with C₂H₅MgBr gives (61% yield (1)) 3-ethyl-3-methylpentyne-1, b.p. 88° at 100 mm., $D_4^{20}=0.7714,\ n_D^{20}=1.4386$. [In orig. paper these products are incorrectly numbered and named.]

3:8322 (1) Campbell, Eby, J. Am. Chem. Soc. **62**, 1798–1800 (1940). (2) K. N. Campbell, B. K. Campbell, Eby, J. Am. Chem. Soc. **60**, 2882–2884 (1938). (3) Favorskaya, Zakharova, J. Gen. Chem. (U.S.S.R.) **10**, 446–450 (1940); C.A. **34**, 7844 (1940).

B.P. 57-61° at 47 mm. (1)
$$n_{\rm D}^{20} = 1.4143$$
 (1)

[For prepn. of C (33% yield (1)) from 2-methylpropyn-3-ol-2 (trimethylpropargyl alcohol) with PCl₃ in dry ether see (1).]

 \ddot{C} in acetone refluxed 4 hrs. with K_2CO_3 and phenol gives (69% yield (1)) phenyl trimethylpropargyl ether, $n_D^{2D} = 1.3408$, but undistillable without decomposition (1).

3:9324 (1) Hurd, Cohen, J. Am. Chem. Soc. 53, 1074 (1931).

B.P. 90-93° at 10 mm. (1) (2)
$$D_{-}^{25} = 1.225$$
 (1) (2) $n_{D}^{25} = 1.4760$ (1) (2)

This compound was at first (2) thought to be 1,2,2-trichlorohexane but later (1) was established as C.

[For formn. of C from hexyne-1 (n-butylacetylene) (1:8055) with Cl₂ in aq. ter-BuOH, MeOAc, AcOH, or Ac₂O at 45° (2) or in 35% aq. HCl, 30% aq. H₂SO₄, 30% H₃PO₄, or 22% MeOH/HCl (1) see indic. refs.]

-2-CHLOROCYCLOHEXANOL-1 OH C_6H_{11} OCl Beil. S.N. 502 $(cis$ -Cyclohexene chlorohydrin)

H₂C H₂C CH₂

CH₂

B.P. 93-94° at 26 mm. (1)

 $D_0^{25} = 1.1261$ (1) $n_D^{25} = 1.4860$ (1)

 $D_0^{16} = 1.150$ (2) $n_D^{16} = 1.4860$ (2)

at 15 mm. (2) [See also trans-2-chlorocyclohexanol-1 (3:0175).]

[For prepn. of C from 2-chlorocyclohexanone-1 (3:0120) by reductn, with isopropyl MgCl, ter-butyl MgX, or cyclohexanyl MgX (the prod. is actually a mixt. of C (72-73%) with the trans isomer (27-28%) see (1); for formn. of C from cyclohexene (1:8070) with HOCl see (2) cf. (5) (this method is claimed by (2) to yield some C, but according to (1) gives solely the trans isomer).

Č with aq. NaOH gives on refluxing (76% yield (1)) cyclohexanone (1:5465) (note difference from the trans isomer which gives cyclohexene oxide). — C with conc. HCl or with ZnCl₂ in ether shows no tendency to convert to the trans isomer (1).

(Note: the following derivatives are listed as trans on the assumption of inversion during formation.)

- ----trans-2-Chlorocyclohexanyl acetate: consts. not reported (4).
- -----trans-2-Chlorocyclohexanyl N-phenylurethane: m.p. 56-59° (3). [From Č + phenyl isocyamate in lt. pet. (3).]
- ——trans-2-Chlorocyclohexanyl N-(α-naphthyl)carbamate: m.p. 165° (1). [From C with α-naphthyl isocyanate htd. 4 hrs. at 100° (1).]

3:9406 1-CHLORO-3-ETHYLPENTADIENE-1,2 Cl C7H11Cl Beil. S.N. 12

B.P. 85-88° at 100 mm. (1)
$$D_4^{18.5} = 0.9297 \text{ (1)} \quad n_{\alpha}^{18.5} = 1.47036 \text{ (1)} \\ D_4^{16.5} = 0.9329 \text{ (1)} \quad n_{\beta}^{18.5} = 1.48431 \text{ (1)}$$

[For prepn. of \bar{C} from 3-ethylpentyn-1-ol-3 (diethyl-ethynyl-carbinol) [Beil. I₁-(236), I₂-(506)] (1) directly, or from the intermediate 1-chloro-3-ethylpentyne-1 (3:9410) by rearr., on shaking either with aq. HCl contg. Cu₂Cl₂ + NH₄Cl (some 3-ethylpenten-3-yne-1 also being formed in the latter case) see (1).]

 \bar{C} with aq. + CaCO₃ first isomerizes to 1-chloro-3-ethylpentyne-1 (3:9410) which then yields 3-ethylpentyn-1-ol-3 (b.p. 136-137°, $D_4^{17} = 0.8748$; N-phenylcarbamate, m.p. 52-53° (1); allophanate, m.p. 130-131° (2)) and 3-ethylpenten-3-yne-1, b.p. 41-43° at 100 mm., $D_4^{13} = 0.7733$, $n_a^{13} = 1.43962$, $n_B^{13} = 1.45224$ (1).

3:9406 (1) T. A. Favorskaya, I. A. Favorskaya, J. Gen. Chem. (U.S.S.R.) 10, 451-460 (1940); C.A. 34, 7844 (1940). (2) Locquin, Sung, Bull. soc. chim. (4) 35, 601 (1924).

3: 9410 1-CHLORO-3-ETHYLPENTYNE-1 Cl
$$C_7H_{11}Cl$$
 Beil. S.N. 12
$$CH_3.CH_2-CH-C \stackrel{|}{=} C$$

$$C_2H_5$$

B.P. 73-76° at 100 mm. (1)
$$D_4^{18.5} = 0.9230$$
 (1) $n_a^{18.5} = 1.44372$ (1) $D_4^{0} = 0.9330$ (1) $n_{\beta}^{18.5} = 1.45364$ (1)

[For prepn. of \bar{C} from 3-ethylpentyn-1-ol-3 (diethyl-ethynyl-carbinol) [Beil. I₁-(236), I₂-(506)] (1) on shaking with HCl alone, or with HCl + Cu₂Cl₂ + NH₄Cl (70% yield together in the latter case with a maximum of 25-30% 1-chloro-3-ethylpentadiene-1,2 (3:9406)) see (1).]

 \bar{C} on shaking with HCl + Cu₂Cl₂ + NH₄Cl is partly converted to 1-chloro-3-ethylpentadiene-1.2 (3:9406) (some 3-ethylpenten-3-yne-1 also being formed), but without the HCl no action occurs (1).

C easily loses HCl yielding 3-ethylpenten-3-yne-1, b.p. 41-43° at 100 mm., $D_4^{13} = 0.7733$, $n_4^{13} = 1.43962$, $n_8^{13} = 1.45224$ (1).

C upon hydrolysis (1) with aq. + CaCO₃ gives a mixt. of 3-ethylpentyn-1-ol-3 (b.p. 136-137°, $D_4^{17} = 0.8748$, $n_{\alpha}^{14} = 1.4385$, $n_{\beta}^{14} = 1.44697$ (1) [N-phenylcarbamate, m.p. 52-53° (1), allophanate, m.p. 130-131° (2)]) and 3-ethylpenten-3-yne-1 (see above).

3:9410 (1) T. A. Favorskaya, I. A. Favorskaya, J. Gen. Chem. (U.S.S.R.) **10**, 451-460 (1940); C.A. **34**, 7844 (1940). (2) Locquin, Sung, Bull. soc. chm. (4) **35**, 601 (1924).

3:9412 d,l-3-CHLOROHEPTENE-1 C₇H₁₃Cl Beil. S.N. 11 (n-Butyl-vinyl-carbinyl chloride) H CH₃ CH₂ CH₂.CH₂—C—CH—CH₂

 $\bar{\mathbf{C}}$ as such is as yet unreported, but both of the opt. active stereoisomerides have been prepared.

[The dextrorotatory isomer, b.p. $92-94^{\circ}$ at 125 mm. (1), $87-88^{\circ}$ at 90 mm. (1), $D_4^{25} = 0.8857$ (1), has been obtd. from levorotatory hepten-1-ol-3 (*n*-butyl-vinyl-carbinol) [Beil. I₂-(488)] with PCl₅ in dry ether (1), with PCl₃ + pyridine (2), or from levorotatory 3-bromoheptene-1 (1) with LiCl in MeOH (1).

[Upon ozonolysis in CHCl₃ followed by Br_2/aq , oxidn, of the resultant aldehyde, levorotatory α -chlorocaproic acid, b.p. 80-95° at 1 mm., was obtd. (2).]

[The levorotatory isomer, b.p. 87-90° at 92 mm. (3), $D_4^{25} = 0.8883$ (4), $n_D^{25} = 1.4380$ (4), has been obtd. from dextrorotatory hepten-1-ol-3 (n-butyl-vinyl-carbinol) [Beil. I₂-(488)] with PCl₅ (3); upon catalytic hydrogenation it yields (3) dextrorotatory 3-chloroheptane, b.p. 87-90° at 113 mm., $n_D^{25} = 1.4221$ (3); cf. d,t-isomer (3:8080).]

B.P. 122-125° at 19 mm. (1)

[For prepn. of \tilde{C} from 2,2,4-trimethylpentanone-3 (pentamethylacetone) [Beil. I-708, I₁-(364), I₂-(760)] with PCl₅ in s.t. for 60 hrs. at 140° (1) (together with other products) see (1).]

3:9536'(1) Favorskii, Fritzman, J. Russ. Phys.-Chem. Soc. 44, 1353 (1912); Cent. 1913, I 1007; C.A. 7, 985 (1913); J. prakt. Chem. (2) 88, 654 (1913).

C as such is as yet unreported; however, the dextrorotatory isomer of C has been obtd. (1) from the metathesis of levorotatory 4-iodooctane with LiCl in MeOH; b.p. 92° at 50 mm.

3:9538 (1) Levene, Rothen, Kuna, J. Biol. Chem. 120, 786 (1937).

[For prepn. of \tilde{C} from 2-methylheptanol-6 [Beil. I-421, I₁-(209), I₂-(453)] with SOCl₃ in cold CHCl₃ + dimethylaniline, then refluxed 2 hrs., see (1).]

Č with activated Mg in dry ether gives with difficulty not over 41% of RMgCl (by carbonation and titration of the resultant acid (1)).

3:9540 (1) Peak, Robinson, J. Chem. Soc. 1937, 1589-1590.

1.4205 (2)

[For prepn. of \tilde{C} from 3-methylheptanol-3 (n-butyl-ethyl-methylcarbinol) [Beil. I-421, I₂-(453)] (1) (2) with dry HCl gas at -10° (2) or at $10-15^{\circ}$ (92% yield (1)) see indic. refs.] \tilde{C} with Mg in dry ether as specified (1) gives 70% yield corresp. RMgCl.

1314

 \bar{C} converted as above to RMgCl, treated with formaldehyde gas, gives (31% yield (1)) 2-ethyl-2-methylhexanol-1, b.p. 85.5-86° at 11 mm., $n_D^{20} = 1.4401$ (1).

3:9544 (1) Whitmore, Badertscher, J. Am. Chem. Soc. **55**, 1560-1562, 1565 (1933). (2) Whitmore, Woodburn, J. Am. Chem. Soc. **55**, 361-365 (1933). (3) Smart, Quayle, J. Am. Chem. Soc. **67**, 21 (1945).

B.P. 83-86° at 79 mm. (1)

[For prepn. of C from 4-methylheptanol-3 with PCl₅ see (1).]

3:9548 (1) Bjelouss, Ber. 45, 628 (1912).

B.P. 50-51° at 12 mm. (1) (3)
$$D_4^{20} = 0.8690$$
 (1) $n_D^{15} = 1.43098$ (1)

[For prepn. of \bar{C} from 4-methylheptanol-4 (methyl-di-n-propyl-carbinol (1)) by saturation with HCl gas see (1).]

[For data on density of \ddot{C} at 15°, 25°, 50°, and 65° and value of parachor at 0°, 25°, 50°, and 75° see (2).]

[\tilde{C} with C_6H_6 + AlCl₃ gives (64% yield (1)) 4-methyl-4-phenyl-heptane, b.p. 120-121° at 12 mm., D_4^{20} = 0.8708, n_D^{16} = 1.49326 (1); for behavior with naphthalene + AlCl₃ in CS₂ see (3).]

3:9550 (1) Halse, J. prakt. Chem. (2) 89, 453-454 (1914). (2) Quayle, Owen, Beavers, J. Am. Chem. Soc. 61, 3108 (1939). (3) Petrov, Kurbskii, J. Gen. Chem. (U.S.S.R.) 14, 492-494 (1944); C.A. 39, 4600 (1945).

 \tilde{C} as such is as yet unreported; however, the dextrorotatory isomer of \tilde{C} has been prepared from dextrorotatory 3-ethylhexanol-1 (1) with SOCl₂; b.p. 85° at 40 mm., $D_4^{27} = 0.879$, $n_D^{25} = 1.4335$ (1).

3:9552 (1) Levene, Marker, J. Biol. Chem. 91, 699-700 (1931).

B.P. 41-43° at 12 mm. (1)
$$n_{\rm D}^{25} = 1.4333 \ (2) \\ D_4^{20} = 0.8869 \ (1) \quad n_{\rm D}^{20} = 1.4353 \ (2) \\ 1.4350 \ (1)$$

[For prepn. from 2,3-dimethylhexanol-3 [Beil. I_1 -(210), I_2 -(454)] (2) (1) with dry HCl gas at 0° (81% yield (1)) see (1) (2).]

3:9565 BENZYL CHLOROFORMATE C₈H₇O₂Cl Beil. VI- 437 (Benzyl chlorocarbonate, "carbobenzoxychloride") CH₂.O.CO.Cl VI₁— VI₂—

B.P. 103° at 20 mm. (1)

Colorless oil with penetrating odor. — \bar{C} is a valuable common reagent for characterization of amino acids and related compounds.

[For prepn. of \bar{C} from benzyl alc. (1:6480) by treatment with phospene (3:5000) directly at -8° (1) or in toluene (2) (91-95% yield (3)) see (1) (2) (3).]

Č on htg. loses CO₂ (1) (2), slowly at 100°, rapidly at 155°, leaving benzyl chloride (3:8535), b.p. 179°. Even vac. distd. Č may contain benzyl chloride.

Č with hydroquinone (1:1590) in aq. Na₂CO₃ under N₂ yields according to conditions (4) mono (carbobenzoxy)hydroquinone, pr. from 50% alc., m.p. 120-120.5° cor. (4), or di (carbobenzoxy)hydroquinone, ndls. from alc., m.p. 142-143° cor. (4).

- Benzyl carbamate [Beil. VI-437]: cryst. from aq. (1) or toluene (3), m.p. 87° (3) (5), 86° (1). [From C by addn. to 5 vols. conc. aq. NH₄OH; yield 95% (5), 91-94% (3).]
 Benzyl-N-phenylcarbamate [Beil. XII-328]: ndls. from pet. other. m. p. 78-77° (cf. 100).
- —— Benzyl-N-phenylcarbamate [Beil. XII-328]: ndls. from pet. ether, m.p. 76-77° (cf. under benzyl alc. (1:6480)). [From Č + aniline + aq. NaOH (6).]
- —— Benzyl N-(o-tolyl)carbamate: m.p. 83.5° (6). [From Č o-toluidine + aq. NaOH (6).]
- Benzyl N-(p-tolyl)carbamate: m.p. 83° (6). [From $\tilde{C} + p$ -toluidine + aq. NaOH (6).]

Colorless liq.

[For prepn. of \tilde{C} from phenylacetic acid (α -toluic acid) (1:0665) with PCl₅ (63% yield (13)) (15) (16) (33) in CHCl₃ (yields: 80–90% (17), 80% (4)) (18) (19) (7); with PCl₅ in C₆H₆ (yield: 97% (5)) (20) (10); with PCl₃ + ZnCl₂ (73% yield (13)); with SOCl₂ (yields: 86% (5), 79% (11), 54% (13)) (21) (9) (22) in CCl₄ (79–80% yield (8)); with SiCl₄ in C₆H₆ (61% yield (23)); or with oxalyl (di)chloride (3:5060) (74% yield (14)) see indic. refs.; for formn. of \tilde{C} from sodium salt of phenylacetic acid (1:0665) with SO₂Cl₂ (phenylacetic acid anhydride (see below) also being formed) see (26).]

[\tilde{C} with Ag \bar{A} in ether (7) or with Pb \bar{A}_2 in ether in s.t. at 100° (24), or \tilde{C} treated with strong tertiary bases such as Et₃N or pyridine (25), or \tilde{C} with anhyd. FeCl₃ yields phenylacetic acid anhydride, pr. from ether, m.p. 72.5° (7), 72° (24); note that with tertiary bases (25) some α,α' -diphenylacetone (dibenzyl ketone) (1:5135), m.p. 34°, together with 6-benzyl-3,5-diphenyl-2-hydroxypyrone-4 (phenylketene trimer) [Beil. XVII-547, XVII₁-(278)], cryst. from C₆H₆, m.p. 173–174° (27), are also formed and that under favorable conds. (27) latter may amount to 50% yield.]—[Note also that phenylacetic acid anhydride, m.p. 72.5°, and phenylacetic acid, m.p. 76.5°, have m.p.'s in close proximity.]

[\overline{C} with Br₂ at 120-125° gives (84% yield (5)) α -bromo- α -phenylacetyl bromide, b.p. 150° at 26 mm. (5).]

[\bar{C} on cat. reductn. with H₂ + Pd/BaSO₄ in toluene as directed (28) gives (80% yield) phenylacetaldehyde (1:0200); however, cat. reductn. in vapor phase using Pd cat. (29) yields only ethylbenzene (1:7410) and β-phenylethyl alcohol (1:6505), while with H₂ + PtO at 200° \bar{C} , although giving traces of phenylacetaldehyde and β-phenylethyl alcohol, yields as the principal prod. (30) benzyl-β-phenylethyl-carbinol, m.p. 41-42° (30), 41° (31).] — [\bar{C} with KCN + quinoline yields 1-phenylacetyl-2-cyano-1,2-dihydroquinoline which on acid hydrolysis gives (32) phenylacetaldehyde (1:0200).]

[Č with C₆H₆ + AlCl₃ gives (82–83% yield (20)) (33) (36) benzyl phenyl ketone (desoxybenzoin) (1:5165), m.p. 60°; similarly Č with other hydrocarbons + AlCl₃ gives substituted desoxybenzoins: e.g., Č with toluene gives (81% yield (18)) (34) (35) 4-methyldesoxybenzoin [Beil. VII-47, VII₁-(239)], m.p. 109° (18); Č with o-xylene gives (37) 3,4-dimethyldesoxybenzoin [Beil. VII-454, VII₁-(244)], m.p. 95° (37); Č with m-xylene gives (37) cf. (38) 2,4-dimethyldesoxybenzoin [Beil. VII-454], oil, b.p. 202–205° at 13 mm. (38); Č with p-xylene gives (37) cf. (38) 2,5-dimethyldesoxybenzoin [Beil. VII-454], oil, b.p. 220–230° at 26 mm. (37); Č + naphthalene (in CS₂) gives (77% yield (39)) a mixt. of benzyl α-naphthyl ketone, m.p. 66–67° (39), and benzyl β-naphthyl ketone, m.p. 99.0–99.5° (39); Č + biphenyl (in CS₂ (40)) gives (40) (41) (42) 4-phenyldesoxybenzoin, m.p.

150° (42) (40), 149° (41); Č with acenaphthene gives (65–68% yield (43)) 5-(phenylacetyl)acenaphthene (4-acenaphthyl benzyl ketone), m.p. 114° (43); Č with bromobenzene (in CS₂) gives (44) 4-bromodesoxybenzoin, m.p. 114-115°, b.p. 165° at 3 mm. (44).] — [For oxidn. of many of these with SeO2 to corresp. benzils see (38).]

[Č with phenols + AlCl₃ (often in nitrobenzene) similarly yields hydroxy-substituted desoxybenzoins: e.g., C with phenol as directed gives (60-70% yield (45)) 4-hydroxydesoxybenzoin [Beil. VIII-165], m.p. 142° cor. (45); C with o-cresol gives (60-70% yield (46) 4-hydroxy-3-methyldesoxybenzoin [Beil, VIII-183], m.p. 152° (46); C with salicylic acid (1:0780) gives (47) 4-hydroxy-3-carboxy-desoxybenzoin; for similar reactn. with catechol resorcinol, and hydroquinone (48) or with phloroglucinol (49) see indic. refs.]

[C with phenol ethers + AlCl₃ (often in nitrobenzene) similarly yields substituted desoxybenzoins: e.g., C with anisole (1:7445) + SnCl4 (51) or AlCl3 (34) (50) gives 4methoxydesoxybenzoin [Beil. VIII-166, VIII₁-(571)], m.p. 77°; C with methyl m-tolyl ether (1:7510) + SnCl₄ (not AlCl₃) gives (60-70% yield (51)) (50) 4-methoxy-2-methyldesoxybenzoin, m.p. 76.5° (51); C with methyl p-tolyl ether (1:7495) + AlCl₃ in CS₂ gives (11) 2-methoxy-5-methyldesoxybenzoin, m.p. 75°, b.p. 205-207° at 14 mm. (11).]

C with phenols on htg. gives corresp. esters: e.g., C with phenol at 150° for 8 hrs. (6) (or C with phenol + aq. alk. (52)) yields phenyl phenylacetate [Beil. IX-435], ndls. from lt. pet., m.p. 50° (6), 42° (52); \bar{C} with β -naphthol at 150° for 6 hrs. yields (6) β -naphthyl phenylacetate, pl. from lt. pet., m.p. 87° (6); C with o-cresol at 90° yields (9) o-tolyl phenylacetate, m.p. 44-45° (9); \ddot{C} with m-cresol at 90° yields (9) m-tolyl phenylacetate, m.p. 51-52° (9); C with p-cresol at 90° yields (9) p-tolyl phenylacetate, m.p. 74-75° (9).

[C with MeZnI (53) in toluene + FtOAc or with Me₂Zn (54) gives (72% yield (53)) benzyl methyl ketone (phenylacetone) (1:5118); C with EtZnI (53) or with EtzZn (54) gives (78% yield (53)) benzyl ethyl ketone [Beil. VII-314, VII₁-(167)].]

(C + o-hydroxyacetophenone (1:1746) + NaĀ at 180° for 6 hrs. followed by hydrol.with alc. KOH gives (6) 4-methyl-3-phenylcoumarin, m.p. 153° (6); C with 2-hydroxy-5methylbenzophenone + Na \overline{A} at 180° gives (80–90% yield (55)) 3,4-diphenyl-6-methylcoumarin, cryst. from AcOH, m.p. 208-209° (55).]

[C with diazomethane in ether gives acc. to cond. (56) (57) (58) (62) either (yield: 84%) (56), 83% (62)) α-chloro-γ-phenylacetone [Beil. VII₁-(162)], m.p. 72-73° (56), b.p. 133-135° at 19 mm. (62), $n_D^{20} = 1.5379$ (62), or α -diazo- γ -phenylacetone (identified by reactn. with p-nitrobenzoic acid yielding (58) α -(p-nitrobenzoyloxy)- α -phenylacetone, pl. from alc., m.p. 120° (58)); note, however, that work of (56) could not be duplicated by later investigators (58) (62).1

 $[\bar{C}]$ with biuret yields (59) N_1 -(phenylacetyl)biuret, cryst. from alc., m.p. 199-200° u.c. dec. (59).1

[C with ethyl carbamate (urethane) at 60-70° gives (70% yield (60)) ethyl N-(phenylacetyl)carbamate, m.p. 113° (60).]

[C with MeOH yields methyl phenylacetate (1:3771), b.p. 220°; C with EtOH yields ethyl phenylacetate (1:3872), b.p. 227.5°.] [For use in prepn. of cellulose esters see (61).] C on hydrolysis yields phenylacetic acid (1:0665), m.p. 76.5°; for the amide, anilide, p-toluidide, and other derivs. corresp. to C see phenylacetic acid (1:0665)

[For prepn. of C from ethyl phenyl ketone (propiophenone) (1:5525) by treatment with PCl₅ followed by alc. KOH see (1).]

[\bar{C} with NaNH₂ in toluene at 110° gives traces (2) of methyl-phenyl-acetylene [Beil. V-514, V₂-(408)].]

3:9604 (1) von Auwers, Ber. 45, 2799-2801 (1912). (2) Bourgeul, Ann. chim. (10) 3, 351 (1925).

B.P. 118-123° at 28 mm. (1)
$$D_4^{19} = 1.0738$$
 (3) $n_D^{19} = 1.5565$ (3) $120-124$ ° at 26 mm. (2) $D_4^{0} = 1.0912$ (3) $0.5-62.5$ ° at 2 mm. (3)

[For prepn. of \bar{C} from benzyl methyl ketone (phenylacetone) (1:5118) with PCl₅ in C₆H₆ (26.3% yield accompanied by 45.9% of the mesomeric 2-chloro-3-phenylpropene-1 (3:9608)) see (2); from 2,3-dichloro-1-phenylpropene-1 (3) by partial reduction with Zn dust in EtOH under N₂ (70% yield accompanied by 16-20% 1-phenylpropadiene-1,2 (phenylallene)) see (3); for formn. as by-prod. during addn. of HOCl to α -methylcinnamic acid see (1).

Note that \ddot{C} on stdg. isomerizes in part (2) to the mesomeric 2-chloro-3-phenylpropene-1 (3:9608).

 \bar{C} (freshly distilled) with O₃ in CHCl₃ gives (2) benzoic acid (1:0715); \bar{C} on oxidn. with KMnO₄ yields (3) benzoic acid (1:0715) + AcOH (1:1010) (note difference from the mesomer).

3:9606 (1) Hose, Farmer, J. Chem. Soc. 1933, 965. (2) Zaki, Iskander, J. Chem. Soc. 1943, 68-69. (3) Ginzburg, J. Gen. Chem. (U.S.S.R.) 8, 1029-1041 (1938); Cent. 1939, I 2183; C.A. 33, 3776 (1939).

1324

B.P. 140° at 37 mm.

M.P. 8-9°

 $D_4^{25} = 1.08815$

 $n_{\rm D}^{25} = 1.58065$

See 3:0010. Division A: Solids.

3:9608 2-CHLORO-3-PHENYLPROPENE-1

B.P. 105-107° at 26 mm. (1)

[For prepn. of \bar{C} from benzyl methyl ketone (phenylacetone) (1:5118) with PCl₅ in C_6H_6 (yield 45.9% accompanied by 26.3% of the mesomeric 2-chloro-1-phenylpropene-1 (3:9606)) see (1).]

C on stdg. isomerizes in part to the mesomeric 2-chloro-1-phenylpropene-1 (3:9606)(1).

Č (freshly distilled) with O₃ in CHCl₃ contg. some EtOH yields (1) ethyl phenylacetate (1:3872) (note difference from the mesomer).

3:9698 (1) Zaki, Iskander, J. Chem. Soc. 1943, 68-69.

3:9610 α-CHLORO-ISOPROPYLBENZENE
(Dimethyl-phenyl-carbinyl

chloride; 2-chloro-2-phenylpropane)

No physical constants for C appear to have been reported, presumably because of its ease of decomposition.

[For prepn. of \bar{C} from dimethyl-phenyl-carbinol [Beil. VI-506] by saturation with dry HCl gas at 0° see (1) (2).]

 \tilde{C} on htg. evolves HCl (1). — \tilde{C} in C_6H_6 + SnCl₄ stood for several hours below 10° gives (88% yield) the "saturated dimer of α -methylstyrene," i.e., 1,1,3-trimethyl-3-phenyl-hydrindene, cryst. from alc., m.p. 52° (3).

 \bar{C} on slow addn. to boilg. alc. KOH (4) or on warming with pyridine (1) (4) loses HCl smoothly giving (70% yield (5)) α -methylstyrene (β -phenylpropylene) [Beil. V-484, V₁-(233)], b.p. 161-162° (5).

 $\ddot{\mathbf{C}}$ dislvd. in MeOH and merely stood overnight gives (6) the corresponding ether, viz., 2-methoxy-2-phenylpropane, b.p. 78° at 13 mm., $D_4^{20} = 0.945$, $n_D^{20} = 1.4981$ (6).

3:9610 (1) Klages, Ber. **35**, 2638 (1902). (2) Hoffman, J. Am. Chem. Soc. **51**, 2546 (1929). (3) Schoepffle, Ryan, J. Am. Chem. Soc. **52**, 4028 (1930). (4) Tiffeneau, Ann. chim. 3:9792 METHYL ω -(CHLOROFORMYL)PELARGONATE Beil. S.N. 178 (ω -(Carbomethoxy)pelargonyl chloride) O $C_{11}H_{19}O_3Cl$

CH₃OOC—(CH₂)₈—C—Cl

B.P. 177° at 23 mm. (1) 158-160° at 10 mm. (2)

Note that C is both an acid chloride and an ester.

[For prepn. of \tilde{C} from methyl hydrogen sebacate (itself obtd. (52-61% (2)) from sebacic acid (1:0730) + MeOH (1:6120)) by action of SOCl₂ (yields: 83-86% (2), 60-70% (1)) set indic. refs.]

- ω-(Carbomethoxy)pelargonamide (methyl sebacamate): cryst. from aq., m.p. 77.4° (3), 72–74° (2). [From Č with conc. aq. NH₄OH at 8° (yields: 93–95% (2), 90% (3)); for dehydration of this prod. (64–71% yield) (3) with P₂O₅ in acetylene tetrachloride to methyl ω-cyanopelargonate, b.p. 170° at 14 mm., $n_D^{25} = 1.4398$ (3), and use of latter in prepn. of high-mol.-wt. linear polymers (4), see indic. refs.]
- **3:9792** (1) Morgan, Walton, J. Chem. Soc. 1936, 904. (2) Bishop, Org. Syntheses 25, 71-72 (1945). (3) Biggs, Bishop, J. Am. Chem. Soc. 63, 944 (1944). (4) Bishop (to Bell Telephone Laboratories, Inc.), U.S. 2,277,033, March 24, 1942; C.A. 36, 4636 (1942).

3:9800 *n*-UNDECANOYL CHLORIDE
$$C_{10}H_{21}OCl$$
 Beil. S.N. 162 (*n*-Hendecanoyl chloride) $CH_{3}.(CH_{2})_{9}.C=O$ Cl B.P. 119–120° at 40 mm. (1) $n_{D}^{5}=1.4465$ (3)

123° at 11 mm. (2) 90° at 1 mm. (3)

Care must be taken to avoid confusion of \tilde{C} with *n*-undecyl chloride (1-chloroundecane) (3:8803).

[For prepn. of \tilde{C} from *n*-undecylic acid (1:0573) with SOCl₂ (yield: 95.5% (1)) (3) (4) see indic. refs.]

[\bar{C} with $C_6H_6+AlCl_3$ should give *n*-undecyl phenyl ketone, but this compd. is unreported in the literature. — \bar{C} with toluene (1:7405) + AlCl₃ gives (80% yield (5)) *n*-undecyl *p*-tolyl ketone, m.p. 32°, b.p. 196–197° at 12 mm.(?)]

[\bar{C} with MeOH presumably gives methyl *n*-undecylate [Beil. II₁-(154), II₂-(314)], b.p. 123° at 9-10 mm. (6); similarly, \bar{C} with EtOH presumably gives ethyl *n*-undecylate [Beil. II-358, II₁-(154)] (known in polymorphic forms for which see (7) (8) (9)); note, however, that prepn. of these esters by this means is not actually reported in the literature).]

 $[\bar{C}]$ with phenol presumably gives phenyl *n*-undecylate, but neither this cpd. nor either of the *n*-undecyl hydroxyphenyl ketones to be expected from its rearr. with AlCl₃ is reported in the literature. — However, for reaction of \bar{C} with hydroquinone (1:1590) see (10).]

[Č with sodium undecylate on htg. presumably gives undecylic anhydride, m.p. 36.7° (11), 35° (12), but this cpd. is actually reported only by other methods (11) (12).]

[For reaction of \hat{C} with diethyl sodioacetosuccinate [Beil. III-801, III₁-(280), III₂-(486)] and subsequent hydrolysis of prod. to γ -ketomyristic acid see (4).]

[\bar{C} with vanilly lamine (4-hydroxy-3-methoxybenzy lamine) gives (2) cf. (13) N-(vanilly l)-myristamide, α -form, m.p. 69.5° (2); β -form, m.p. 62.0-62.5° (2); the m.p. of 54-56° reported earlier (13) may have been a mixture, but that of 73-74° by other workers (14) is unexplained.]

 \bar{C} on hydrolysis yields undecylic acid (1:0573), m.p. 29.3°; for the amide, anilide, p-toluidide, and other derivatives corresp. to \bar{C} see undecylic acid (1:0573).

3:9856
$$\alpha$$
-NAPHTHYLACETYL CHLORIDE $C_{12}H_{9}OCl$ Beil. IX — IX₁-(278)

[For prepn. of \tilde{C} from α -naphthylacetic acid (1:0728) with PCl₅ (4) (1), or with SOCl₂ alone (2) (5) or in C₆H₅ (6), see indic. refs.]

Č with AlCl₃ in nitrobenzene (1) (but *not* by SnCl₄ in CS₂ at room temp. (2)) losses HCl and ring-closes yielding acenaphthenone (1:5200), m.p. 121° cor.

[\bar{C} with aminoacetic acid (glycine) yields (5) N-(α -naphthylacetyl) glycine, m.p. 153-154° (5). (For reactn. of \bar{C} with other amino acids and use as plant hormone see (5)).]

 \bar{C} on hydrolysis yields α -naphthylacetic acid (1:0728) q.v. for the corresp. amide and anilide.

3:9856 (1) Badische Anilin- und Soda-Fabrik, Ger. 230,237, Jan. 20, 1910; Cent. 1911, I 358. (2) Cook, Hewett, J. Chem. Soc. 1933, 1108. (5) Isler (to Hoffmann-LaRoche Inc.), U.S. 2,179,979, Nov. 14, 1939; C.A. 34, 1808 (1940); Brit. 510,138, July 27, 1939; Cent. 1939, II 3872; C.A. 34, 4080 (1940); Swiss 203,078, May 16, 1939; Cent. 1939, II 3872. (6) Gilman, Kirby, J. Am. Chem. Soc. 51, 3477, Note 18 (1929). (7) King, Henshall, J. Chem. Soc. 1945, 418.

Note that care must be taken to avoid confusion of \tilde{C} with *n*-lauryl chloride (1-chlorododecane) (3:8810).

PREPARATION OF C

[For prepn. of \tilde{C} from *n*-lauric acid (1:0605) with PCl₅ (yields: 91.5% (10), 66% (13)) (6) (15) (32), with PCl₅ + ZnCl₂ (45% yield (13)), with PCl₃ (yields: 80% (8), 72% (13)) (4) (16), with PCl₃ + ZnCl₂ (79% yield (13)), with SOCl₂ (yields: 92% (9), 80-84% (11), 83% (13), 80% (20)) (1) (5) (17) (32) (33), with oxalyl (di)chloride (3:5060) (99% yield (3)) (2), or with carbonyl chloride (phosgene) (3:5000) at 140-150° (85-90% yield (18)) see indic. refs.]

[For prepn. of \bar{C} from α, β -dichloroethyl laurate (19) on distn. with 0.1% ZnCl₂ (chloroacetaldehyde (3:7212) is also formed) see (19).]

CHEMICAL BEHAVIOR OF C

BEHAVIOR WITH INORGANIC REACTANTS

Hydrogenation of \tilde{C} . [\tilde{C} with $H_2 + Pt$ cat. at 200-320° and 50-180 mm. or with $H_2 + Raney$ Ni at 160° and 50 mm. fails (8] to give the expected lauraldehyde (1:0017); this result is apparently due to side reactions of the latter since undecane (1:8820) and tricosane, $C_{23}H_{48}$, were isolated (8).]

Behavior with sodium. [Č (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 4 hrs. gives (60% yield (20)) tetracosen-12-diol-12,13 dilaurate, i.e., the dilaurate ester of CH₃.(CH₂)₁₀.C(OH)=C(OH).(CH₂)₁₀.CH₃, cryst. from acetone/C₆H₆ (3:1), m.p. 42-43° (20).]

Behavior with Na_2O_2 . [\bar{C} with aq. Na_2O_2 below 50° gives (21) dilauroyl peroxide, but no constants for either this prod. or for lauroyl hydrogen peroxide can be found in the literature; for use of dilauroyl peroxide as cat. for drying oils see (22).]

Behavior with NaN₃. [\tilde{C} with NaN₃ in C₆H₆ reacts to give lauroyl azide (not isolated (23)), which loses N₂ and rearr. giving (81–86% yield (23)) undecyl isocyanate, b.p. 103° at 3 mm. (23).]

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [\bar{C} with $C_6H_6+AlCl_3$ gives (yields: 100% (14), 71% (11)) (24) (25) (26) (27) phenyl undecyl ketone (laurophenone) [Beil. VII-345, VII₁-(186)], m.p. 47° (24) (28), 46° (14) (25), 45° (26), 44-45° (11); b.p. 222-223° at 21 mm. (25), 201-202° at 9 mm. (26), 193-194° at 9 mm. (11), 174° at 3 mm. (29) (corresp. oxime, m.p. 64.5° (11); semicarbazone, m.p. 98° (11); 2,4-dinitrophenylhydrazone, m.p. $101-102^\circ$ (11)). — For analogous reactions of \bar{C} in pres. of AlCl₃ with biphenyl (1:7175), diphenyl ether (1:7125), diphenylene oxide (1:7205), carbazole, thiophene, and furan see (30); for use of these products as waxes, addition agents for lubricants, etc., see (30) (31).]

With alcohols. \bar{C} with alcohols gives in general the corresp. alkyl laurates [e.g., \bar{C} with MeOH gives methyl laurate, m.p. +5°, b.p. 148° at 18 mm. (10); \bar{C} with EtOH gives ethyl laurate (1:4196), m.p. -1.7 b.p. 269°; etc. $-\bar{C}$ with benzyl alc. (1:6480) gives (32) benzyl laurate; \bar{C} with menthol (1:5940) gives (33) menthyl laurate; etc.].

C (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., C with ethylene glycol (1:6465) gives (34) ethylene glycol dilaurate (1:2157), m.p. 52°; C with propanediol-1,2 (1:6455) gives (34) propylene glycol dilaurate, m.p. 35°; C with butanediol-1,3 (1:6482) gives (34) 1,3-butylene glycol dilaurate, m.p. about 16.5°; C with butanediol-1,4 (1:6516) gives (34) tetramethylene glycol dilaurate, m.p. 45.5°].

Č has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. $\bar{\mathbb{C}}$ on htg. with phenols splits out HCl yielding the corresp. esters. [E.g., $\bar{\mathbb{C}}$ with phenol (1:1420) gives (6) phenyl laurate, m.p. 24.5° (6), b.p. 210° at 15 mm. (6), 159–161° at 1 mm. (35); $\bar{\mathbb{C}}$ with p-cresol (1:1410) gives (6) p-tolyl laurate, m.p. 28° (6), b.p. 219.5° at 15 mm. (6). $-\bar{\mathbb{C}}$ (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (36) pyrocatechol dilaurate, m.p. 35.5°; $\bar{\mathbb{C}}$ (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (36) resorcinol dilaurate, m.p. 43–44.5°; $\bar{\mathbb{C}}$ (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (36) hydroquinone dilaurate, m.p. 85–86°.]

[\tilde{C} with phenol (1:1420) + AlCl₃ in sym.-tetrachloroethane (3:5750) as solvent, however, gives (37) (35) (38) a mixt. of the corresp. hydroxylaurophenones; viz., 32.6% yield (37) o-hydroxyphenyl undecyl ketone, m.p. 44-45.5° (corresp. 2,4-dinitrophenylhydrazone, m.p. 92-93°) and 24.6% yield (37) p-hydroxyphenyl undecyl ketone, m.p. 71-72° (corresp. 2,4-dinitrophenylhydrazone, m.p. 150-151°); for study of influence upon o/p ratio of use of nitrobenzene and CS₂ as solvents see (38); for prepn. of these hydroxylaurophenones from phenyl laurate by BF₃ rearr. see (39); for their methyl ethers see (44).]

With salts of organic acids. [Č with Na laurate at 100° with protection from moist air gives (40) lauric anhydride (1:0601), m.p. 44° (41), 42.1° (42), 41.8° (43), 41° (40), but the latter is usually prepd. from lauric acid (1:0605) by htg. with Ac₂O (41) (42) (43).]

With Grignard reagents. \bar{C} with RMgX reagents derived from tertiary halides not only undergoes the normal reaction to give the corresp. secondary alcohol but also suffers reduction [e.g., \bar{C} with ter-BuMgCl gives (7) the expected 2,2-dimethyltetradecanol-3 (67% yield) together with lauryl alc. (1:5900) (13.7%) and ter-butyl-undecyl-carbinyl laurate (10.4%); similarly, \bar{C} with ter-AmMgCl gives (7) lauryl alc. (1:5900) (54.8%) and 3,3-dimethylpentadecanol-4 (17.7%)].

With organic amines. \bar{C} with organic primary amines yields the corresp. amides [e.g., \bar{C} with p-cymidine (2-methyl-5-isopropylaniline) gives (1) lauro-(2-methyl-5-isopropyl)-anilide, m.p. 82-83°; \bar{C} with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (12) N-(vanillyl)lauramide, α -form, m.p. 72.5-73°, β -form, m.p. 67-67.5°].

 $\bar{\mathbf{C}}$ on hydrolysis yields lauric acid (1:0605), m.p. 43-44°; for the amide, anilide, p-toluidide, and other derivatives corresp. to $\bar{\mathbf{C}}$ see lauric acid (1:0605).

o-BENZOYLBENZOYL CHLORIDE --- A 3:9880 3-CHLORO-3-PHENYLPHTHALIDE—B

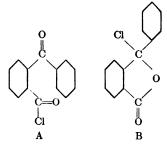

(o-Benzovlbenzovl pseudo-chloride)

C₁₄H₉O₂Cl

A. Beil. X-749 X1----

> B. Beil. XVII - 361 XVII₁---

3:9880

C appears to react in two tautomeric forms corresp. to structures A and B, the independent existence of which, however, has not (as yet) been definitely established. same method of prepn. has in various laboratories given results sometimes suggesting a preponderance of A, sometimes of the tautomer B. The constants reported for C show a correspondingly wide variation, e.g., m.p. 82-83° (1), abt. 70° (2), 59-60° (3); b.p. 170-171° at 1 mm. (1); other workers, e.g. (5) (6), have sometimes obtd. C in crystn form and sometimes not and have failed to report constants.

[For prepn. of C from o-benzoylbenzoic acid (1:0720) with PCl₅ in CS₂ (2) (3) (4) (5), or PCl₅ (7), PCl₃ (7) (4), or SOCl₂ (7) (4) (5) (6) (1) (8) (11), see indic. refs.; for prepn. of C from 3-phenylphthalide with Cl₂ at 115-120° see (5)

Č-A on htg. above 130° loses HCl and ring-closes yielding (9) (10) anthraquinone (1:9095). C-A with conc. aq. NH4OH at 0° yields (9) o-benzoylbenzamide, m.p. 165° cor. (9); with aniline yields (11) o-benzoylbenzanilide, m p. 195° (11).

C-A with MeOH yields (2) (7) (4) methyl o-benzoylbenzoate, m p. 51.5° (4), 51.7° (4). 51-52° (2), 52° (12); C-B with MeOH yields (7) methyl pseudo-o-benzoylbenzoate (3methoxy-3-phenylphthalide), m.p. 80-81° (7).

Č-A with EtOH should yield ethyl o-benzoylbenzoate, m.p. 58° (13) (12); Č-B with EtOH yields (14) ethyl pseudo-o-benzoylbenzoate (3-ethoxy-3-phenylphthalide), m.p. 51-53° (14), 56° (13).

C-A with K phenolate or with phenol in pyridine yields (5) phenyl o-benzoylbenzoate, m.p. 162-163° (5); C-B under same circumstances yields phenyl pseudo-o-benzoylbenzoate (3-phenoxy-3-phenylphthalide), m.p. 80-82° (5). [For analogous behavior of other phenols see (5).]

Č-B with phenol yields (6) 3-(p-hydroxyphenyl)-3-phenylphthalide, m.p. 168-170° (6). [For analogous reactn. with other phenols and phenol ethers see (6).]

[For reactn. of \bar{C} with α -methylnaphthalene see (15).]

---- α-CHLORO-DIPHENYLACETYL CHLORIDE C₁₄H₁₀OCl₂ Beil. IX - 675 IX₁-(283)

B.P. 180° at 14 mm. M.P. 50°

See 3:0885. Division A: Solids.

3:9885 n-TETRADECANOYL CHLORIDE C₁₄H₂₇OCl Beil. II - 368 (n-Myristoyl chloride) CH₃.(CH₂)₁₂.C=O II₁-(162) II₂-(329)

Care must be taken to avoid confusion of $\bar{\mathbf{C}}$ with *n*-myristyl chloride (1-chlorotetradecane) (3:9874).

PREPARATION OF C

[For prepn. of \bar{C} from myristic acid (1:0630) with SOCl₂ (yields: 91% (8), 80% (3), 80-84% (9), 79% (6)) (12) (2) (13) (14) (15); with PCl₅ (89% yield (6)) (7) (14); with PCl₃ (11) (1) (17); with PCl₃ + ZnCl₂ (79% yield (6)); or with oxalyl (di)chloride (3:5060) (10) see indic. refs.]

CHEMICAL BEHAVIOR OF C

BEHAVIOR WITH INORGANIC REACTANTS

Hydrogenation of \bar{C} . [\bar{C} with $H_2 + Pt$ cat. at 220-230° at 60-65 mm. gives (1) not only some *n*-myristaldehyde (1:0004) and its trimer but also (by loss of CO from \bar{C}) *n*-tridecane [Beil. 1-171, I₂-(134)], b.p. 234°.]

Hydrolysis of C. C on hydrolysis with aq. presumably yields myristic acid (1:0630) + HCl although actual record of this reaction is lacking in the literature.

Behavior with sodium. [\bar{C} (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed (with stirring) for 10 hrs. gives (64% yield (3)) octacosen-14-diol-14,15 dimyristate, i.e., the dimyristate ester of CH₃. (CH₂)₁₂.C(OH)=C(OH). (CH₂)₁₂.CH₃, cryst. from acetone/C₆H₆ (3:1), m.p. 54-55° (3).]

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons (or their equivalents). [C with C₆H₆ + AlCl₃ in CS₂ gives (69% yield (9)) phenyl n-tridecyl ketone (myristophenone) [Beil. VII₁-(186)], m.p. 52-53°

(corresp. oxime, m.p. 69.5°; corresp. 2,4-dinitrophenylhydrazone, m.p. 98.0-98.5°; corresp. semicarbazone, m.p. 101° (9)).]

[\bar{C} with thiophene + SnCl₄ gives (yield not stated (18)) 2-furyl *n*-tridecyl ketone (2-myristolythiophene), oil, b.p. 205-210° at 4 mm., $D_{25}^{25} = 0.9506$, $n_{D}^{35} = 1.4961$ (18).]

[C with carbazole + AlCl₃ gives (yield not stated (18)) 2,8-dimyristolylcarbazole, m.p. 169° (18).

With alcohols. \tilde{C} with alcohols gives in general the corresp. alkyl myristates. [E.g., \tilde{C} with MeOH gives methyl myristate (1:2013), m.p. 18.5°; \tilde{C} with EtOH gives ethyl myristate (1:4316), m.p. 11.9°, b.p. 295°; etc. — \tilde{C} with benzyl alc. (1:6480) gives (14) benzyl myristate; \tilde{C} with menthol (1:5940) gives (15) menthyl myristate; etc.]

C (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., C with ethylene glycol (1:6465) gives (20) ethylene glycol dimyristate (1:2233), m.p. 63°; C with propanediol-1,2 (1:6455) gives (20) propylene glycol dimyristate, m.p. 41.5°; C with butanediol-1,3 (1:6482) gives (20) 1,3-butylene glycol dimyristate, m.p. 29.5-31.0°; C with butanediol-1,4 (1:6516) gives (20) tetramethyleneglycol dimyristate, m.p. 55°].

 \bar{C} has been much employed in prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text [however, for examples of use of \bar{C} with the compound of glycerol + acetone (i.e., 4-hydroxymethyl-2,2-dimethyldioxolane-1,3) in prepn. of glyceryl α -monomyristate (" α -monomyristin") see (10) (5)].

With phenols. \bar{C} on htg. with phenols splits out HCl yielding the corresp. esters [e.g., \bar{C} with phenol (1:1420) on htg. gives (7) phenyl myristate, m.p. 36°, b.p. 230° cor. at 15 mm. (7); \bar{C} with p-cresol (1:1410) on htg. gives (7) p-tolyl myristate, m.p. 39°, b.p. 239.5° at 15 mm. (7); \bar{C} (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (12) pyrocatechol dimyristate, m.p. 47-48°; \bar{C} (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (12) resorcinol dimyristate, m.p. 53°; \bar{C} (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (12) hydroquinone dimyristate, m.p. 90-90.3°].

[\overline{C} with phenol (1:1420) + AlCl₃ in sym.-tetrachloroethane (3:5750) as solvent, however, gives (11) a mixt. of the corresp. hydroxymyristophenones: viz., 31.9% yield (11) o-hydroxyphenyl n-tridecyl ketone, m.p. 52-55° (corresp. 2,4-dinitrophenylhydrazone, m.p. 92.0-92.5°) and 36.7% yield (11) p-hydroxphenyl n-tridecyl ketone, m.p. 78-80° (corresp. 2,4-dinitrophenylhydrazone, m.p. 142-143°); for prepn. of these same products by direct rearr. of phenyl myristate (above) with AlCl₃ in sym.-tetrachloroethane soln. see (19).

With salts of organic acids. [C with sodium myristate at 100° in absence of air gives (21) myristic anhydride (1:0629), m.p. 53.5° (22), 53.4° (23), 51° (21).]

With organometallic compounds. [\bar{C} with ethyl sodioacetoacetate gives (60% yield (13)) ethyl α -myristoylacetoacetate, b.p. 170–183° at 3 mm.; this prod. with NH₃ gas splits off the aceto group yielding (13) ethyl myristoylacetate, m.p. 36–37°, b.p. 187–188° at 7 mm.]

With organic amines. \tilde{C} with organic primary amines yields the corresp. amides [e.g., \tilde{C} with p-cymidine (2-methyl-5-isopropylaniline) gives (2) myristo-(2-methyl-5-isopropyl)-anilide, m.p. 88-89°; \tilde{C} with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (4) N-(vanillyl)myristamide, α -form, m.p. 82°, β -form, m.p. 76.5-77°].

C on hydrolysis yields myristic acid (1:0630), m.p. 53.86°; for the amide, anilide, p-toluidide, and other derivatives corresp. to C see myristic acid (1:0630).

B.P. 172-176° at 10 mm. (1) at 5 mm. (2)

[For prepn. of C from pentadecanoic acid (1:0620) with SOCl₂ (97% yield (1)) see (1). [For reactn. of C with vanillylamine see (2); with 1,7-aminonaphthol see (1).]

C on hydrolysis yields pentadecanoic acid (1:0620) q.v. (for the amide, anilide, and other derivatives corresp. to \bar{C} see 1:0620).

3:990 (1) Fierz-David, Kuster, Helv. Chim. Acta 22, 86-89, 101 (1939). (2) Ford-Moore, Phillips, Rec. trav. chim. 53, 857 (1934).

CH₃.(CH₂)₁₄.CH₂Cl C₁₆H₃₈Cl Beil. I - 172 1-CHLOROHEXADECANE (n-Hexadecyl chloride; cetyl chloride) I_{2} -(138)

B.P. 289° dec. M.P. 15°

See 3:0015. Division A: Solids.

Note that care must be taken to avoid confusion of C with palmityl chloride (1-chloro-hexadecane) (3:0015).

PREPARATION OF C

[For prepn. of \bar{C} from palmitic acid (1:0650) with PCl₅ (yields: 60% (2), 49% (12)) (5) (13) (14) (15) (16), with PCl₃ + ZnCl₂ (72% yield (12)), with SOCl₂ directly (yields: 93.5% (7), 86% (12), 80% (6)) (17) (19) (45) or in CCl₄ soln. (18), or with phospene (3:5000) at 140-155° (70-75% yield (20)) see indic. refs.)

CHEMICAL BEHAVIOR OF C

BEHAVIOR WITH INORGANIC REACTANTS

With sodium. [C (1 mole) with metallic sodium (1.2 moles) in dry ether refluxed with stirring as directed gives (70% yield (6)) dotriaconten-16-diol-16,17 dipalmitate, i.e., the dipalmitate ester of CH₃. (CH₂)₁₄. C(OH)=C(OH). (CH₂)₁₄. CH₃, cryst. from acetone/C₆H₆ (3:1), m.p. 61-62° (6).]

With sodium azide. [\bar{C} with NaN₃ in C₆H₆ gives (14) palmitoyl azide [Beil. II-375] (not isolated by (14)) which loses N₂ with rearr. to pentadecyl isocyanate [Beil. IV-202] (not isolated by (14) but from indirect prepn. reported (21) as m.p. 8-14°) [cf. corresp. behavior of lauroyl chloride (3:9858)].]

With water. \bar{C} with aq. hydrolyzes to palmitic acid (1:0650) + HCl. [For study of rate of hydrolysis with ord. H₂O and with D₂O see (22).]

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons. [\bar{C} with $C_6H_6+AlCl_3$ gives (60% yield (23)) (24) (25) pentadecyl phenyl ketone (penmitophenone) [Beil. VII-347, VII₁-(186)], lfts. from alc., m.p. 59° (23) (24) (26), b.p. 250.5-251.0° at 15 mm. (24) (corresp. oxime, m.p. 73-74° (26)). — \bar{C} with toluene + AlCl₃ gives (24) pentadecyl p-tolyl ketone [Beil. VII-347, VII₁-(186)], lfts. from alc., m.p. 60° (24) (26), b.p. 262° cor. at 15 mm. (24) (corresp. oxime, m.p. 60° (27), semi-carbazone, m.p. 114.5° (26), phenylhydrazone, m.p. 54-55° (26)). — For analogous behavior of \bar{C} + AlCl₃ + m-xylene (24), mesitylene (27) (2), diphenyl ether (23), and carbazole (28) see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see (28) (29).]

With alcohols. Č with alcohols gives in general the corresp. alkyl palmitates [e.g.; Č with MeOH gives methyl palmitate (1:2055), m.p. 30°; Č with EtOH gives ethyl palmitate (1:2034), α-form, m.p. 19.4°, β-form, m.p. 24.2°, etc.; Č with bezynl alc. (1:6480) gives (30) benzyl palmitate, m.p. 36°; Č with menthol (1:5940) gives (31) menthyl palmitate, m.p. 32°].

Č (2 moles) with dihydric alcs. on htg. gives the corresp. neutral esters [e.g., C with ethylene glycol (1:6465) gives (32) ethylene glycol dipalmitate (1:2269), m.p. 70.5°; C with propanediol-1,2 (1:6455) gives (32) propylene glycol dipalmitate, m.p. 52.5-54.5°; C with butanediol-1,3 (1:6482) gives (32) 1,3-butylene glycol dipalmitate, m.p. 39-40°; C with butanediol-1,4 (1:6516) gives (32) tetramethylene glycol dipalmitate, m.p. 63°].

Č has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. \bar{C} on htg. with phenols splits out HCl yielding the corresp. esters. [E.g., \bar{C} with phenol (1:1420) gives (5) phenyl palmitate, m.p. 45° (5), 44.5–46.0° (33), b.p. 249.5° at 15 mm. (5); \bar{C} with p-cresol (1:1410) gives (5) p-tolyl palmitate, m.p. 47°, b.p. 258° at 15 mm. — \bar{C} (2 moles) with pyrocatechol (1:1520) at 110° for 2 hrs. gives (34) pyrocatechol dipalmitate, m.p. 58°; \bar{C} (2 moles) with resorcinol (1:1530) at 110° for 2 hrs. gives (34) resorcinol dipalmitate, m.p. 62.5–63.5°; \bar{C} (2 moles) with hydroquinone (1:1590) at 110° for 2 hrs. gives (34) hydroquinone dipalmitate, m.p. 94.5°.]

[\tilde{C} with phenol (1:1420) + AlCl₃ in sym.-tetrachloroethane (3:5750) as solvent, however, gives (35) (33) (36) a mixt. of the corresp. hydroxypalmitophenones; viz., 25.4% yield o-hydroxyphenyl pentadecyl ketone, m.p. 54-56° (corresp. 2,4-dinitrophenylhydrazone, m.p. 94-95° (35)), and 28.5% yield p-hydroxyphenyl pentadecyl ketone, m.p. 84.5-85° (35), 78° (37) (corresp. 2,4-dinitrophenylhydrazone, m.p. 141-142° (35)); for study of influence upon o/p ratio of use of nitrobenzene and of CS₂ as solvents see (36).]

With salts of organic acids. [\overline{C} with Ag palmitate at 100° for 10 min. (38) or \overline{C} with Na \overline{A} (32) (42) gives palmitic anhydride (1:0651), m.p. 64° (39), 63.9° (40), 63-64° (41), 63° (38), 62-63° (32) (43), but the latter is usually prepd. from palmitic acid (1:0650) by htg. with Ac₂O (39) (40) (41) (42) (43)]

With esters. [C with diethyl sodiomalonate would be expected to give diethyl palmitoylmalonate, but for unsuccessful attempt to realize this reaction see (44).]

[\overline{C} with ethyl sodio-acetacetate in dry ether gives (62% yield (11)) (45) ethyl α -palmitoylacetoacetate, m.p. 36-36.5° (11) (45); note that this prod. with aq. NaOH splits off the acetyl group giving (62% yield (11)) ethyl palmitoylacetate, m.p. 37-38° (11) (45).]

With amines. \bar{C} with org. prim. amines yields the corresp. amides [e.g., \bar{C} with p-cymidine (2-methyl-5-isopropylaniline) gives (1) palmito-(2-methyl-5-isopropyl)anilide, m.p. 90-91°; \bar{C} with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (8) N-(vanillyl)-palmitamide, α -form, m.p. 89-89.5°, β -form, m.p. 84-84.5°].

 \tilde{C} on hydrolysis yields palmitic acid (1:0650), m.p. 62.7°; for the amide, anilide, *p*-toluidide, and other derivs. corresp. to \tilde{C} see palmitic acid (1:0650).

--- 1-CHLOROHEPTADECANE
$$CH_3(CH_2)_{15}$$
. CH_2Cl $C_{17}H_{36}Cl$ Beil. I -- $I_{1-}(69)$ I_{2-}

B.P. 192-195° at 10 mm. M.P. 24°

See 3:0100. Division A: Solids.

B.P. 176° at 4 mm. (1) 139-144° at 0.04 mm. (2)

[For prepn. of \bar{C} from margaric acid (1:0635) with SOCl₂ (84.5% yield (2)) (1) (3) see indic. refs.]

C with phenol (1:1420) on htg. gives (3) phenyl margarate, cryst. from MeOH, m.p. 37°, b.p. 240-250° dec. at 11 mm. (3).

[C with alkali margarates presumably would yield margaric anhydride, cryst. from ether or pet. ether, m.p. 67.6° cor. (4), although this reaction has not actually been reported and the margaric anhydride is readily obtd. from the acid (1:0635) with Ac₂O (4).]

[For reaction of C with vanilly lamine see (1); with 1,7-aminonaphthol see (2).]

 $\bar{\mathbf{C}}$ on hydrolysis yields margaric acid (1:0635); for the amide and other derivs, corresp. to $\bar{\mathbf{C}}$ see margaric acid (1:0635).

3:9925 (1) Ford-Moore, Phillips, Rec. trav. chim. 53, 858 (1934). (2) Fierz-David, Kuster, Helv. Chim. Acta. 22, 89, 101 (1939). (3) Skraup, Schwamberger, Ann. 462, 153 (1928). (4) Wallace, Copenhaver, J. Am. Chem. Soc. 63, 699-700 (1941).

--- 1-CHLORO-OCTADECANE CH₃.(CH₂)₁₆.CH₂Cl C₁₈H₃₇Cl Beil. S.N. 10 (n-Octadecyl chloride; stearyl chloride)

B.P. 180-190° at 12 mm. M.P. 21°

See 3:0095. Division A: Solids

[See also the trans stereoisomer, viz., elaidoyl chloride (3:9950).]

[For prepn. of \bar{C} from oleic acid (1:0565) with PCl₅ (yields: 75% (2), 48% (6), 27% (7)) (8), with PCl₃ (46% yield (6)) (9), with PCl₃ + ZnCl₂ (50% yield (7)), with SOCl₂ (yields: 82.5% (4), 80% (7), 75% (2)) (3), with oxalyl (di)chloride (3:5060) (90% yield (3)), or with COCl₂ (3:5000) (10) see indic. refs.]

Note that \tilde{C} with oleic acid (1:0565) forms a const.-boilg. mixt., b.p. about 241° at 6 mm., contg. 40% \tilde{C} (6).

The reaction of C as an acyl chloride with a wide variety of organic compounds has been reported in many patents which cannot be reviewed here.

Č has also been employed in the course of prepn. of mixed glycerides; although this topic cannot be fully reviewed in this text, see for examples (3) (11) (12).

[For behavior of C with resins derived from indene, coumarone, or dicyclopentadiene see (13).]

[Č with diazomethane gives an intermediate diazoketone which on decompn. with AcOH gives (75% yield (4)) nonadecen-10-one-2-yl-1 acetate, m p 21° (14).]

[\bar{C} with phenol (1:1420) at 160° for 4 hrs. gives (55% yield (18)) phenyl oleate, oil, b.p. 256-257° at 12 mm. (18).]

[Č with Na oleate yields (10) oleic anhydride [Beil. II-469, II₂-(441)], lfts. or scales from ether or alc., m.p. 22.2° (15), 22° (16), but the latter is usually prepared directly (15) (17) from oleic acid (1:0565).]

 $\tilde{\mathbf{C}}$ on hydrolysis yields oleic acid (1:0565); for the amide, anilide, p-toluidide, and other derivs. corresp. to $\tilde{\mathbf{C}}$ see oleic acid (1:0565).

Note that care must be taken to avoid confusion of \bar{C} with stearyl chloride (1-chloro-octadecane) (3:0095).

PREPARATION OF C

[For prepn. of \bar{C} from stearic acid (1:0660) with PCl₅ directly (1) (12) (13) (21) or in CCl₄ soln. (14), with SOCl₂ directly (yields: 97% (10), 81% (3)) (4) (7) (15) (16) (17) or in CCl₄ soln. (yield 86% (8)) (14), with PCl₃ (18), with oxalyl (di)chloride (3:5060) (11), or with phospene (3:5000) at 140-150° (70-75% yield (19)) see indic. refs.]

CHEMICAL BEHAVIOR OF C

BEHAVIOR WITH INORGANIC REAGENTS

Hydrogenation of \tilde{C} . [\tilde{C} with $H_2 + Pd/BaSO_4$ cat. in boilg. xylene gives (20) (21) stearaldehyde (1:0012).]

Behavior with bromine. [For behavior of C with Br₂ at room temp., 100°, and 135° see (22).]

Behavior with sodium. [\bar{C} (1 mole) with metallic sodium (1.2 moles) in dry ether under reflux gives (67% yield (3)) hexatriaconten-18-diol-18,19 distearate, i.e., the distearate ester of CH₃. (CH₂)₁₆.C(OH)=C(OH). (CH₂)₁₆.CH₃, m.p. 67-68°.]

With sodium azide. [\check{C} with NaN₃ in C₆H₆ gives (23) (12) stearoyl azide (not isolated) which loses N₂ with rearr. giving (43% yield (23)) heptadecyl isocyanate, b.p. 208-209°

at 17 mm. (23), 290-203° at 15 mm. (24); cf. the corresp. behavior of lauroyl chloride (3:9858).]

With water. C with aq. hydrolyzes to stearic acid (1:0660) + HCl.

BEHAVIOR WITH ORGANIC REACTANTS

With hydrocarbons (or their equivalents). [\bar{C} with $C_6H_6 + AlCl_3$ gives (yields: 65% (25), 60% (26)) (27) (18) heptadecyl phenyl ketone (stearophenone) [Beil. VII-347, VII₁-(187)], lfts. from alc., m.p. 64-65° (25), 63.5-64.5° (18), 64° (28), 59° (27) (29) (corresp. oxime, m.p. 53° (27), phenylhydrazone, m.p. 54° (28)); note that in this reaction no introduction of a second acyl radical occurs (30), and that attempts to prepare stearophenone by use (with $C_6H_6 + AlCl_3$) of the mixed anhydride from stearic acid with ketene) gave very poor yields (29). — For patents on the use of stearophenone as an electric insulator (31), on its sulfonation (32), or on its reaction with PCl₃ (33) see indic. refs.]

[\bar{C} with toluene + AlCl₃ gives (34) heptadecyl p-tolyl-ketone [Beil. VII-347, VII₁-(187)], lfts. from alc., m.p. 67° (34), 66–67° (28), b.p. 278° cor. at 15 mm. (34) (corresp. oxime, m.p. 64° (27)). — For analogous behavior of \bar{C} with naphthalene (1:7200) (18), tetralin (1:7550) (18), biphenyl (1:715) (18) (35), p-methylbiphenyl (35), p-chlorobiphenyl (3:1912) (35), diphenyl ether (1:7125) (35), p-nitrodiphenyl ether (35), furan (1:8015) (35), p-methylfuran (35), dibenzofuran (35), thiophene (35), dibenzothiophene (35), carbazole (35), etc., see indic. refs.; for use of these products as waxes, addition agents for lubricants, etc., see (35) (36).]

[For behavior of \bar{C} with resins derived from indene, coumarone, or dicyclopentadiene see (37). — For addition of \bar{C} to alkynes in pres. of a condensing agent such as AlCl₃, ZnCl₂, etc., see (38) cf. (39).]

With alcohols. \bar{C} with alcohols gives in general the corresp. alkyl stearates. [E.g., \bar{C} with MeOH gives methyl stearate (1:2095), m.p. 38.8°; \bar{C} with EtOH gives ethyl stearate (1:2078), α-form, m.p. 30.9°, β-form, m.p. 33.5°. — \bar{C} with benzyl alc. (1:6480) gives (40) benzyl stearate, m.p. 45.8°; \bar{C} with menthol (1:5940) gives (41) menthyl stearate, m.p. 38–39°.]

C has also been much employed in the prepn. of mixed glycerides, but this topic cannot be expanded in detail in this text.

With phenols. [\bar{C} on htg. with phenols splits out HCl yielding the corresp. esters: e.g., \bar{C} with phenol (1:1420) gives (1) phenyl stearate, m.p. 52° (1), 51.5-53.0 (44), b.p. 267° at 15 mm. (1); \bar{C} with p-cresol (1:1410) gives (1) p-tolyl stearate, m.p. 54°, b.p. 276° at 15 mm.]

[\bar{C} (2 moles) with pyrocatechol (1:1520) at 100° gives (42) (43) pyrocatechol distearate, m.p. 83-85° (43), 68° (42); \bar{C} (2 moles) with hydroquinone (1:1590) at 130° gives (42) hydroquinone distearate, m.p. 97°.]

[\tilde{C} with phenol (1:1420) + AlCl₃ in sym.-tetrachloroethane (3:5750) as solvent, however, gives (45) (44) (46) a mixt. of the corresp. hydroxystearophenones: viz., 27.8% yield o-hydroxyphenyl heptadecyl ketone, m.p. 64-66° (corresp. 2,4-dinitrophenylhydrazone, m.p. 96-97° (45)); and 28% yield p-hydroxyphenyl heptadecyl ketone, m.p. 87-89° corresp. 2,4-dinitrophenylhydrazone, m.p. 139.5-140° (45)); for study of influence upon o/p ratio of use of nitrobenzene or of CS₂ as solvents see (46).]

With salts of organic acids. [C with Ag stearate at 100° for 10 min. gives (47) stearic anhydride (1:4915), m.p. $71-72^{\circ}$ (48), $71-71.5^{\circ}$ (49), 70.7° (50), 70.5° (47), $70-71^{\circ}$ (51), but the latter is usually prepd. from stearic acid (1:0660) by htg. with Ac₂O (48) (49) (50) (51).

With esters. [Č with ethyl sodio-acetoacetate refluxed 1 hr. under N_2 gives (68% yield (52)) ethyl α -stearoylacetoacetate, m.p. 42°; note that this prod. with aq. NaOH splits off its acetyl group giving (74% yield (52)) ethyl stearoylacetate, m.p. 46.5° (corresp. copper enolate, m.p. 111-112°).]

With Grignard reagents. [C with ter-BuMgBr gives (28.5% yield (8)) ter-butyl n-hep-tadecyl ketone, m.p. 44.8-45.1° (corresp. semicarbazone, m.p. 78.0-78.2°); note that low yield suggests probability that the RMgBr also acted as a reducing agent cf. corresp. behavior of lauroyl chloride (3:9858), but no study of such effect for this combination is reported. — C with cyclohexyl MgBr gives (8) cyclohexyl n-heptadecyl ketone.]

[\bar{C} with EtMgBr + CdCl₂ (53) or \bar{C} with ZnEt₂ (54) gives (65% yield (53)) ethyl n-heptadecyl ketone (eikosanone-3) [Beil. I-719, I₁-(374), I₂-(774)], m.p. 60-61° (54), 59.5-60° (55), 57° (28), 54-55° (53) (corresp. oxime, m.p. 55.5-56.5° (54), semicarbazone, m.p. 89-91° (53)).]

With diazomethane. [\bar{C} with CH₂N₂ (2.2 moles) as directed gives (88.5% yield (15)) 1-diazononadecanone-2, m.p. 69°, which in AcOH loses N₂ and esterifies giving (89% yield (15)) nonadecanon-2-yl-l acetate, m.p. 72°.]

With amines. \bar{C} with org. prim. amines yields the corresp. amides [e.g., \bar{C} with p-cymidine (2-methyl-5-isopropylaniline) gives (56) stearo-(2-methyl-5-isopropyl)anilide, m.p. 93-94°; \bar{C} with vanillylamine (4-hydroxy-3-methoxybenzylamine) gives (5) N-(vanillyl)-stearamide, α -form, m.p. 94 5-95°, β -form, m.p. 90.0-90.5°].

 \bar{C} on hydrolysis yields stearic acid (1:0660), m.p. 69-70°; for the amide, anilide, p-toluidide, and other derivatives corresp. to \bar{C} see stearic acid (1:0660).

CHAPTER XXIII

I. INDEX OF COMPOUNDS ACCORDING TO EMPIRICAL FORMULA

This Empirical Formula Index comprises four parts as follows:

- A. Compounds containing only carbon and chlorine.
- B. Compounds containing only carbon, oxygen, and chlorine.
- C. Compounds containing only carbon, hydrogen, and chlorine.
- D. Compounds containing only carbon, hydrogen, oxygen, and chlorine.

Within each section the component individuals are arranged in groups according to increasing number of carbon atoms. Within each group of isomeric compounds the order of listing follows the sequence of the eight units comprising the Chemical Type Index.

A. COMPOUNDS CONTAINING ONLY CARBON AND CHLORINE

CCl ₄ Carbon tetrack	C ₁ GROUP M W. = 153.8 aloride	Cl=92.2% 3:5100	C ₄ Cl ₂ 1,4-Dichlorob	C ₄ GROUP M.W. = 119.0 ntadi-yne-1,3	Cl=59.6% 3:1
C ₂ Cl ₂ Dichloroacetyl	C ₂ GROUP M.W.=94.9 ene	Cl=74.7% 3:5010	C ₄ Cl ₆ Hexachlorobu	M.W. = 260.8 tadiene-1,3	Cl=81.6% 3:6425
C ₂ Cl ₄ Tetrachloroeth	M.W. = 165.8 ylene	C1=85.5% 3:5460	C _b Cl ₈ Octachlorocyc	C ₅ GROUP M.W.=343.7 lopentene	Cl=82.5% 3:0422
C ₂ Cl ₆ Hexachloroeth	M.W. = 236.8 ane	Cl=89.9% 3:4835	0.01	C ₆ GROUP	CI BARO
C ₅ Cl ₅ Hexachloropro	C ₃ GROUP M.W.=248.8 pene	Cl=85.5% 3:6370	C ₆ Cl ₆ Hexachlorober	$M.W. = 284.8$ nzene . C_{10} GROUP	Cl=74.7% 3:4939
C ₃ Cl ₈ Octachloroprop	M.W.=319.7	Cl=88.7% 3:4450	C ₁₀ Cl ₈ Octachloronar	M.W.=403.8 ohthalene	Cl=70.3% 3:4893

B. COMPOUNDS CONTAINING ONLY CARBON, OXYGEN, AND CHLORINE

COCl ₂ Carbonyl chlor	C ₁ GROUP M.W. = 98.9 ride (phosgene)	Cl=71.7% 3:5000	C ₂ O ₂ Cl ₂ Oxalyl (di)chl	M.W. = 126.9 oride	Cl=55.9% 3:5060
C2OCl4	C ₂ GROUP M.W. = 181.8	Cl=78.0% 3:5420	C ₂ O ₂ Cl ₄ Trichlorometh (diphosgene	M.W. = 197.8 ayl chloroformate)	Cl=71.7% 3:5515

C ₈ OCl ₄ Trichloroacrylo	C ₈ GROUP M.W. = 193.9 byl chloride	Cl=73.2% 3:5845	C ₄ O ₂ Cl ₆ Trichloroacetic	M.W.=308.8 acid anhydride C ₆ GROUP	Cl=68.9% 3:6575
Hexachloroace	M.W.=124.1 tone opionyl chloride	Cl=58.1% 3:6312 3:0470	C ₆ OCl ₆ "Hexachlorop	M.W. = 300.8 henol"	Cl=70.0% 3:3180
C ₈ O ₂ Cl ₆ Trichloromethy	M.W.=280.8 yl trichloroacetate	Cl=75.8% 3:0290		M.W. = 245.9 nzoquinone-1,2 nzoquinone-1,4	Cl=57.7% 3:3965
C ₃ O ₃ Cl ₆ Di-(trichlorom		Cl=71.7%	(chloranil)		3:49 78
carbonate (t	riphosgene) C4 GROUP	3:1915	C ₆ O ₂ Cl ₆ 2,3,5,5,6,6-Hex cyclohexen-		Cl=67.2% 3:3260

II. INDEX OF EMPIRICAL FORMULAS ACCORDING TO PERCENTAGE CHLORINE CONTENT

The empirical formulas for all groups of isomers listed in this book are represented below in diminishing order of their percentage chlorine. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their molecular weights comprises Index III (page 1383).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume, see the Empirical Formula Index (page 1359).

III. INDEX OF EMPIRICAL FORMULAS ACCORDING TO MOLECULAR WEIGHTS

The empirical formulas for all groups of isomers listed in this book are represented below in increasing order of their molecular weights. Note that there are numerous instances in which this value is the same for several different formulas. An analogous list of empirical formulas arranged according to their percentage chlorine comprises Index II (page 1380).

To ascertain which specific compounds corresponding to a given formula are described in the text of this volume see the Empirical Formula Index (page 1359).

IV. INDEX OF COMPOUNDS ACCORDING TO CHEMICAL TYPES

The numerous individual compounds of Order III whose preparation, properties, and reactions comprise the main text of this book are there listed in progressively increasing order of melting points (Division A, Solids), boiling points (Division B, Liquids), or empirical formulas (Division C, liquids for which data at ordinary pressure are not available). Unlike the treatment of Order I in an earlier volume, the compounds of the present Order III are not subdivided into genera. For this reason a highly useful feature of this volume is the following Chemical Type Index in which each compound is listed in one (or more) of the following eight arbitrary units.

- UNIT 1. Chloro substitution products of saturated acyclic hydrocarbons.
- Unit 2. Chloro substitution products of unsaturated acyclic hydrocarbons.
- Unit 3. Chloro substitution products of cyclic hydrocarbons.
- Unit 4. Chloro substitution products of hydroxy compounds.
- Unit 5. Chlorosubstitution products (and their relatives) of carbonyl compounds.
- Unit 6. Chloro substitution products of carboxylic acids and anhydrides.
- UNIT 7. Acyl chlorides.
- UNIT 8. Chlorine substitution products of ethers and of esters.

In order to facilitate recognition of the extent of subdivision of the above eight *units*, a brief summary of the subclassification is placed at the head of each one. Note that the names employed in this index are those best suited to recognition of the chemical relationships involved, and are not necessarily the same as those selected as principal names in the individual descriptions in the text.

Attention is also called to the fact that, in addition to this chemical type index, this volume is provided with conventional alphabetical name index and with empirical formula index.

UNIT 1. CHLORO SUBSTITUTION PRODUCTS OF ACYCLIC SATURATED HYDROCARBONS

(Summary of Classification of Unit 1)

- A. Monochloro Derivatives.
 - 1. With primary halogen.
 - 2. With secondary halogen.
 - 3. With tertiary halogen.

B. DICHLORO DERIVATIVES.

- 1. With both chlorine atoms primary.
 - a. Both chlorine atoms on same carbon.
 - b. The two chlorine atoms on different carbons.
- 2. With both chlorine atoms secondary.
 - a. Both chlorine atoms on same carbon.
 - b. Both chlorine atoms on different carbons.
- 3. With both chlorine atoms tertiary.
- 4. With one chlorine primary and one secondary.
- 5. With one chlorine primary and one tertiary.
- 6. With one chlorine secondary and one tertiary.

C. TRICHLORO DERIVATIVES.

- 1. With all three chlorine atoms primary.
- 2. With two chlorine atoms primary and one secondary.
- 3. With two chlorine atoms primary and one tertiary.
- 4. With one chlorine atom primary and two secondary.
- 5. With one chlorine each primary, secondary, and tertiary.
- 6. With all three chlorine atoms secondary.
- 7. With two chlorine atoms secondary and one tertiary.

D. TETRACHLORO DERIVATIVES.

- 1. With all four chlorine atoms primary.
- 2. With three chlorine atoms primary and one secondary.
- 3. With two chlorine atoms primary and two secondary.
- 4. With one chlorine atom primary and three secondary.
- 5. With three chlorine atoms primary and one tertiary.
- 6. With two chlorine atoms primary, one secondary, and one tertiary.

E. PENTACHLORO DERIVATIVES.

- 1. With all five chlorine atoms primary.
- 2. With four chlorine atoms primary and one secondary.
- 3. With three chlorine atoms primary and two secondary.
- 4. With two chlorine atoms primary and three secondary.
- 5. With four chlorine atoms primary and one tertiary.

F. HEXACHLORO DERIVATIVES.

- 1. With all six chlorine atoms primary.
- 2. With five chlorine atoms primary and one secondary.
- 3. With four chlorine atoms primary and two secondary.
- G. HEPTACHLORO DERIVATIVES.
- H. OCTACHLORO DERIVATIVES.

UNIT 2. CHLORO SUBSTITUTION PRODUCTS OF UNSATURATED ACYCLIC HYDROCARBONS

(Summary of Classification of Unit 2)

A. OF MONO-OLEFINS.

- 1. With one chlorine on C attached to unsaturation.
 - a. This chlorine atom is primary.
 - aı Monochloro.
 - a₂ Dichloro.
 - as Polychloro.
 - b. This chlorine atom is secondary.
 - b₁ Monochloro.
 - b₂ Dichloro.
 - ba Polychloro.
- 2. With two chlorine atoms on C attached to unsaturation.
 - a. Both these chlorines are on same C atom.
 - b. These two chlorines are on different carbons.
- 3. With none of the chlorine atoms on C attached to unsaturation.
 - a. Monochloro.
 - b. Dichloro.
 - c. Polychloro.

- B. OF DIOLEFINS.

 - With "cumulative" unsaturation.
 With "conjugated" unsaturation.
 - a. C4 series.
 - b. C₅ series. c. C6 series.
 - d. Cs series.
 - 3. With "isolated" unsaturation.
- C. OF TRIOLEFINS.
- D. OF TETRAOLEFINS.
- E. OF ALKYNES.
 - 1. With chlorine attached to C also bearing triple bond.
 - a. Monochloro.
 - b. Dichloro.
 - 2. With chlorine (s) attached to some C other than that bearing triple bond.
 - a. Monochloro.
 - a₁ Chlorine is primary.
 - a₂ Chlorine is tertiary.
 - b. Dichloro.
- F. OF ALKADI-YNES.
- G. OF ALKENYNES.

UNIT 2. CHLORO SUBSTITUTION PRODUCTS OF UNSATURATED ACYCLIC HYDROCARBONS

A. Of M	ono-olefins		$C_4H_6Cl_2$	1,3-Dichlorobutene-1.	3:7650
 1. With one chlorine on C attached to unsaturation a. This chlorine atom is primary 				1,3-Dichloro-2-methyl- propene-1	3:5590
	81 MONOCHLORO			as POLYCHLORO	
C ₂ H ₃ Cl	Vinyl chloride	3:7010	$C_4H_5Cl_8$	1,3-Dichloro-2-(chloro-	
C_8H_5Cl	1-Chloropropene-1	3:7030		methyl)propene-1	3:9066
C ₄ H ₇ Cl	1-Chlorobutene-1	3:7110	C ₄ H ₄ Cl ₄	1,3,4,4-Tetrachloro- butene-1	3:9058
	1-Chloro-2-methyl- propene-1	3:71 20	C ₆ H ₇ Cl ₈	2-(Chloromethyl)1,3- dichlorobutene-1	3:9201
C_5H_9Cl	1-Chloropentene-1	3:7420	ь. Т	This chlorine atom is secon	dary
	1-Chloro-2-methyl-			b ₁ monochloro	
	butene-1	3:7303	C_8H_5Cl	2-Chloropropene-1	3:7020

UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI

(Summary of Classification of Unit 3)

- A. OF CYCLOALKANES.
- B. OF MONONUCLEAR AROMATIC HYDROCARBONS.
 - 1. With all chlorine in nucleus.
 - 2. With all chlorine in side chain(s).
 - a. Saturated side chain(s).
 - b. Unsaturated side chain(s).
 - 3. With chlorine both in ring and in side chain(s).
- C. OF POLYNUCLEAR AROMATIC HYDROCARBONS.
 - 1. With all chlorine in nucleus.
 - a. Systems with uncondensed rings.
 - b. Systems with condensed rings.
 - 2. With all chlorine in side chain(s).
 - a. Systems with two uncondensed rings.
 - b. Systems with two condensed rings.
 - c. Systems with three uncondensed rings.
 - 3. With chlorine both in nucleus and side chain.

UNIT 3. CHLORO SUBSTITUTION PRODUCTS OF HYDROCARBONS CONTAINING CYCLIC NUCLEI

A. Of Cycloalkanes			B. Of Mononuclear Aromatic

UNIT 4. CHLORO SUBSTITUTION PRODUCTS OF HYDROXY COMPOUNDS

(Summary of Classification of Unit 4)

A. OF ALCOHOLS.

- 1. Of acyclic alcohols.
 - a. Saturated monohydric.
 - a₁ Primary.
 - a₂ Secondary.
 - as Tertiary.
 - b. Saturated dihydric.
 - c. Unsaturated (olefinic) monohydric.
 - c1 Primary.
 - c2 Secondary.
- 2. Of cyclanols (alicyclic alcohols).
- 3. Of aromatic alcohols.
- 4. Of alcohols containing also other functional groups.

 - a. Ether/alcohols. b. Ester/alcohols.
 - c. Ether/ester/alcohols.
 - d. Acid/alcohols (hydroxy acids).

B. OF PHENOLS.

- 1. Of mononuclear phenols.
 - a. Monohydric.
 - a₁ Derivatives of phenol.
 - a₂ Derivatives of methylphenols.
 - as Derivatives of xylenols.
 - a4 Derivatives of miscellaneous alkylphenols.
 - as Derivatives of phenolic aldehydes.
 - as Derivatives of phenolic acids.
 - a7 Derivatives of phenolic acid chlorides.
 - b. Dihydric.
 - b₁ Derivatives of pyrocatechol.
 - b₂ Derivatives of resorcinol.
 - ba Derivatives of hydroquinone.
 - c. Trihydric.
- 2. Of binuclear phenols.
 - a. Monohydric.
 - a₁ With uncondensed rings.
 - as With condensed rings.

UNIT 5. CHLORO SUBSTITUTION PRODUCTS OF CARBONYL COMPOUNDS (AND THEIR RELATIVES)

(Summary of Classification of Unit 5)

A. OF ALDEHYDES.

- 1. Acyclic aldehydes.
 - a. Saturated.
 - b. Unsaturated.
 - c. Relatives of the above.
 - c1 Hydrates.
 - c₂ Hemiacetals.
 - cs Diethylacetals.
 - c4 Acetals with chlorine only in alcohol radicals;
 - c. Polymers.
- 2. Aromatic aldehydes.
 - a. Simple aldehydes.
 - b. Phenolic aldehydes.
- B. OF KETONES.
 - 1. Dialkyl ketones.
 - 2. Alicyclic ketones.
 - 3. Alkyl aryl ketones.
 - a. With chlorine only in alkyl.
 - b. With chlorine both in alkyl and aryl.
 - c. With chlorine only in aryl.
 - 4. Diaryl ketones.
 - 5. Ketones containing also other functional groups.
 - a. Keto-acid chlorides.
 - b. Keto-acid esters.

C. OF QUINONES.

- 1. Mononuclear quinones.
- 2. Dinuclear quinones.
- 3. Trinuclear quinones.

UNIT 6. CHLORO SUBSTITUTION PRODUCTS OF CARBOXYLIC ACIDS AND ANHYDRIDES

(Summary of Classification of Unit 6)

A. OF ACYCLIC ACIDS.

- 1. With no other functional group.
 - a. Saturated monobasic.
 - b. Saturated dibasic.
 - c. Unsaturated (olefinic) monobasic.d. Unsaturated (olefinic) dibasic.

 - e. Unsaturated (acetylenic) monobasic.
- 2. With some other functional group.
 - a. Hydroxy monobasic.

- B. OF ISOCYCLIC ACIDS.
 - 1. With no other functional group.
 - a. Monobasic.

 - b. Dibasic.c. Tribasic.
 - 2. With some other functional group.
 - a. Phenolic acids.
 - b. Ether acids.
- C. ANHYDRIDES OF ACYCLIC ACIDS.
 - 1. Saturated.
 - 2. Unsaturated.
- D. ANHYDRIDES OF ISOCYCLIC ACIDS.

UNIT 7. ACYL CHLORIDES

(Summary of Classification of Unit 7)

A. OF ACYCLIC ACIDS (R.CO.Cl).

- 1. The radical (R) contains no chlorine.
 - a. Corresponding acid is saturated and monobasic.
 - b. Corresponding acid is saturated and dibasic.
 - c. Corresponding acid is unsaturated and monobasic.
 - d. Corresponding acid is unsaturated and dibasic.
 - e. Corresponding acid contains also other functional groups.
 - e₁ Ether/acyl chloride.
 - e₂ Ester/acyl chloride.
 - es Keto/acyl chloride.
- 2. The radical (R) does contain chlorine.
 - a. Corresponding acid is saturated and monobasic.
 - b. Corresponding acid is saturated and dibasic.
 - c. Corresponding acid is unsaturated and monobasic.
 - d. Corresponding acid is unsaturated and dibasic.
 - e. Corresponding acid contains other functional groups.

B. OF ISOCYCLIC ACIDS.

- 1. The radical (R) contains no chlorine.
 - a. Corresponding acid is monobasic.
 - at With -COOH group attached to ring.
 - a2 With -COOH group attached to saturated side chain.
 - as With -- COOH group attached to unsaturated side chain.
 - as With —COOH group attached to ring containing another functional group.
 - b. Corresponding acid is dibasic.
- 2. The radical (R) does contain chlorine.
 - Corresponding acid is monobasic.

C. OF HETEROCYCLIC ACIDS.

- 1. The radical (R) contains no chlorine.
 - a. Corresponding acid is monobasic.

UNIT 7. ACYL CHLORIDES

A. Of Acyc	lic Acids (R.CO.OH)		C ₆ H ₁₁ OCl	n-Caproyl chloride	3:8168
1. The	radical (R) contains no	chlorine

UNIT 8. CHLORO SUBSTITUTION PRODUCTS OF ETHERS AND OF ESTERS

(Summary of Classification of Unit 8)

A. ETHERS.

- 1. Completely acyclic saturated ethers.
 - a. Monoethers.
 - a₁ Derived from symmetrical ethers.
 - a2 Derived from unsymmetrical ethers.
 - b. Diethers.
 - c. Ethers containing also other functions.
 - c1 Ether/alcohols.
 - c₂ Ether/esters.
 - ca Ether/ester/alcohols.
 - c4 Ether/ester/acyl halides.
- 2. Completely acyclic unsaturated ethers.
- 3. Cyclic ethers.
 - a. Non-aromatic.
 - a₁ Monoethers.
 - a₂ Diethers.
 - b. Aromatic ethers (phenol ethers).
 - c. Heterocyclic ethers.

B. ESTERS.

- 1. Esters of aliphatic acids.
 - a. Acids containing no chlorine.
 - a₁ From acetic acid.
 - as From oxalic acid.
 - as From carbonic acid.
 - b. Saturated monobasic acids containing chlorine.
 - b₁ From chloroacetic acid.
 - ba From dichloroscetic scid.
 - be From trichloroacetic acid.

- b4 From chloropropionic acid.
- bs From chlorobutyric acids.
- be From chlorovaleric acids.
- c. Saturated dibasic acids containing chlorine.
 d. Unsaturated monobasic acids containing chlorine.
- e. Unsaturated dibasic acids containing chlorine.
- f. Esters of chloroformic acid.
- g. Esters of keto acids.
- 2. Esters of aromatic acids.
 - a. Acids containing no chlorine.
 - b. Acids containing chlorine.
- 3. Esters of inorganic acids.
- 4. Esters containing also other functional groups.
 - a. Ester/alcohols.
 - a₁ From acids containing no chlorine.
 - a₂ From acids containing chlorine.
 - b. Ester/acyl chlorides.
 - c. Ester/ethers.
 - d. Ester/ether/alcohols.
 - e. Ester/ether/acyl chlorides.

V. ALPHABETICAL NAME INDEX TO COMPOUNDS OF ORDER 3

- 1. Note that this index refers only to numbered compounds of Order 3; for practical reasons it cannot include the large number of related products which are incidentally mentioned within the text of these numbered individuals.
- 2. In this alphabetical name index all literal prefixes (such as those below) are ignored in establishing the alphabetical sequence. Note, however, that "iso" is not recognized as a prefix but is construed as an integral part of the name and therefore indexed under the letter I.
- 3. Within any given group of related prefixes the following sequences are employed:

- 4. Note that except when needed to distinguish from other stereoisomers the prefix d,l is omitted from the alphabetical index names even when included in text of the individual compound.
- 5. Whenever in a particular name the syllable (di) is inserted in parentheses to avoid possible ambiguity, such syllable is ignored in establishing the alphabetical sequence.
- 6. For a given family of derivatives of the same halogen-free parent, the sequence of listing is based upon the parent, e.g., all the dichloro substitution products of naphthol-1 precede all those derived from naphthol-2.
